Busting the Trust: Unraveling the Highway Trust Fund 1968-1978

by
Richard F. Weingroff
Federal Highway Administration

President Richard M. Nixon signed the Federal-Aid Highway Act of 1973 in the Oval Office on August 13. Behind him, l to r, are Senator Jennings Randolph (D-WV), Senator Howard H. Baker, Jr. (R-Tn.), Representative Robert P. Hanrahan (R-Il.), Secretary of Transportation Claude S. Brinegar, Administrator Frank C. Herringer of the Urban Mass Transportation Administration, and Federal Highway Administrator Norbert T. Tiemann.

FOREWARD

"Busting the Trust" began as a history of the Federal-Aid Highway Act of 1973, the landmark legislation that introduced Interstate withdrawal/substitution, strengthened metropolitan transportation planning, and gave local officials the option of using some Highway Trust Fund revenue for rail transit. As I researched the history of the legislation, I found that the story had to be put in the context of the social, economic, and environmental changes of the 1960s and 1970s. I also found that the story did not end on August 13, 1973, when President Richard M. Nixon signed the legislation.

As "Busting the Trust" evolved, it became the story of Federal-Aid Highway Acts from 1968 to 1978, evolving mass transit legislation during that time, changing attitudes about highways, and efforts to divert Highway Trust Fund revenue to transit. The story involved political changes, the fights in New York City and elsewhere for transit operating subsidies, a battle between highway supporters and transit advocates, a break-in at the Watergate and a war in Israel, the impact of broad legislation such as the National Environmental Policy Act and the Clean Air Act, and the people who contributed to the legislative process. Many of the themes were new at the time, but they continue to affect transportation policy to this day.

As a result, the article I intended to write about the 1973 Act changed into a monograph on the history of a pivotal time in the evolution of the Federal-aid highway program that began in 1916 and continues to this day. Readers can continue the story in other articles on the Highway History Web site such as: "Palace Coup: President Ronald Reagan and the Surface Transportation Assistance Act of 1982," "Creation of a Landmark: The Intermodal Surface Transportation Efficiency Act of 1991," and "Backbone: Creation of the National Highway System."

This monograph would not have been possible without the personnel and collection of the U.S. Department of Transportation Library. I have relied on the library for almost all my articles on the Highway History Web site, but as I looked through my stacks of research material for "Busting the Trust," I saw that a high percentage of it came from that single source. Much of the material was available on the library shelves, but I needed the special assistance of the DOT Library staff, especially Loretta Hoffman and Rosalind Romain, to locate additional material that was critical to the story I wanted to tell. Since beginning my highway history research in the 1970s, I have worked with several generations of DOT librarians, and Loretta, Rosalind, and their colleagues have continued the tradition of outstanding service to library patrons. I can't thank them enough for their

cooperation, unfailing courtesy, success in finding what I requested, and patience when I didn't return it by the due date.

I hope this monograph will be a helpful addition to the study of transportation legislation.

Introduction:
The Highway Trust Fund

President Herbert Hoover was convinced that in the midst of the worst Depression the Nation had experienced, the Federal Government must balance its budget. Doing so would require cuts in Federal programs and increases in Federal revenues.

The Revenue Act of 1932, approved June 6, 1932, enacted dozens of taxes, including taxes on estates, corporations, income, capital gains and such consumer products as admissions to any place by ticket or subscription; auto bodies, tires and inner tubes; cameras, candy, chewing gum, furs, soft drinks, and sporting goods; firearms, shells, and cartridges; coal, coke, and copper ore; telegraph, telephone, cable, and radio dispatches; and checks, jewelry, matches, refrigerators, stamps, and toiletries. In addition, a tax of 1 cent a gallon was enacted for gasoline, to be collected from refineries. It was expected to raise $150 million a year for deficit reduction. The tax was not linked to funding for the Federal-aid highway program.

Highway interests were opposed and would remain opposed to the tax for decades. A tax penalizing a specific group should not be imposed, they argued, for the support of general government purposes. By the 1950s, with the tax at 2 cents a gallon, many Governors opposed the gas tax, which they considered a State prerogative, and the Federal-aid highway program, which they thought should be devolved to the States.

At the same time, many State highway officials favored continuing the tax and the program. For political or policy reasons, many States would not be able to increase their own gas tax by 2 cents if the Federal Government stopped collecting the tax. If a State's tax income declined, toll authority officials would benefit because they would be the only source of revenue to build the expressways the Nation needed. The authority of State highway officials would diminish. The alternative they came to favor through the American Association of State Highway Officials (AASHO) was linking the Federal gas tax to expenditures for the Federal-aid highway program. After all, Federal-aid highway funds were made available to the State highway agencies. Linkage, as Professor Mark Rose pointed out, "offered financial security and vastly expanded opportunities to build roads." [Rose, Mark H., *Interstate Express Highway Politics: 1939-1989* (Revised edition), The University of Tennessee Press, 1979, p. 46]

Some Members of Congress agreed that linkage between Federal highway user tax revenue and Federal highway expenditures was a good idea. Bills were introduced to create a highway trust fund, similar to those established at the State level, to ensure a direct linkage between gas tax revenue and highway construction. For example, Senator Warren Magnuson (D-Wa), a former Representative (1937 to 1944) who had been in the Senate since December 14, 1945, introduced S. 216 on January 7, 1953, on behalf of himself and Senator Harley M. Kilgore (D-WV). The bill would set aside revenue from excise taxes on automobiles, tires and tubes, gasoline, and lubricating oil for the Federal-aid highway program. All revenue collected from these sources would be "appropriated" to the "Federal-Aid Highway Trust Fund" and all trust fund receipts would be used for highway projects. Senator Magnuson explained:

> The American Association of State Highway Officials at its thirty-eighth annual meeting in Kansas City, Mo., December 12, adopted a resolution urging that Federal-aid for highway authorizations be increased to the full amount of the Federal revenues from gasoline taxes. I am today introducing a bill embodying this plan and design to carry out that objective. ["Reservation of Certain Excise Taxes to Aid Federal-Aid Program," *Congressional Record-Senate*, January 7, 1953, p. 159-160]

On March 3, 1953, Representative John C. Kluczynski (D-Il.), a member of the Committee on Public Works in his second term in office, introduced a companion bill, H.R. 3637. As he did so, he commented on the condition of the Nation's roads:

> In 1941 we began running out of roads when we had 32 million motor vehicles registered. Our main highways were bursting at the seams. To the present time roadbuilding and maintenance have been interrupted [by World War II and the Korean War] and so today with 52 million vehicles using the highways our whole economy has and is being built around motorized transportation of both people and property.

The result of the growth of vehicles, while highways remained static, was that the main highways and secondary roads were "badly congested, being too narrow, too winding, and antiquated." The solution is "a uniform and unified system of four- and six-lane highways."

He explained the logic of the trust fund idea:

> Why should not the public that pays the tax from motorized traffic then have the full benefit and assistance that that tax can provide? No one can deny that the proper source to look to to solve our muddled traffic problems should be the manufacturers' excise taxes on automobile accessories and the kindred products.

He added:

> Our whole economy and federal defense must have this aid. It is the only way we can keep America on the move.

He, too, noted that AASHO had "recently decried the urgent need of such a bill as I today present." ["Automobile Excise Tax to Aid Federal-Aid Road Program," *Congressional Record-House*, March 3, 1953, p. 1569]

Commissioner of Public Roads Thomas H. MacDonald, who had headed the U.S. Bureau of Public Roads (BPR) since 1919, was not so sure. He had reached the mandatory retirement age of 70 in 1950, but President Harry S. Truman had extended his service in the emergency of the Korean War. Under new President Dwight D. Eisenhower, MacDonald was fired in late March 1953, a few months before his planned retirement that summer. In speaking to the press before leaving office, he stressed the importance of the Federal-State partnership:

> [It] is a workable plan to accomplish a continuing program that involves both local and national services; second, it sets a pattern in harmony with the concepts of federal government.

To meet growing needs, he told reporters:

> It is logical to borrow for important needs and to retire the borrowings from user income. By setting aside the income from a fraction—say a cent of the gasoline tax, there is an assured fund that can be used to retire bonds.

As always, though, his attitude toward toll roads was cautious:

> Financing toll roads with bonds paid for entirely out of revenue [tolls collected on the road] can lead us into a dangerous situation. Only certain stretches of heavy traffic roads, like the New Jersey Turnpike, can be self supporting on that basis.

Issuing bonds backed by earmarked gasoline tax receipts was one way of paying the difference between bond charges and toll collections.

Observing that the Federal Government collected $800 million a year in fuel tax revenue but provided funds to the States at a rate of only $575 million, he thought it "desirable to equate federal aid to federal gas tax revenues." He was not, however, convinced that all Federal highway user tax revenues should be dedicated to highways, citing excise taxes on such products as perfume and alcoholic beverages as examples of taxes levied simply to meet government expenses. "Take the cigarette tax," he explained. "I don't know how you would apply its proceeds for the benefit of cigarette users." [“MacDonald retires as Commissioner of Public Roads; F. V. du Pont takes over," *Engineering News-Record*, April 2, 1953, p. 52, and Odlin, William S., Jr., "MacDonald Stresses Antiquity of 76 Pc. of U.S. Main Roads," *Transport Topics*, April 6, 1953, p. 1]

During the 1952 presidential campaign, General Eisenhower had spoken of the value of good roads in a statement to the Hearst Newspapers. He had said:

> Next to the manufacture of the most modern implements of war as a guarantee of peace through strength, a network of modern roads is as necessary to defense as it is to our national economy and personal safety.
>
> We have fallen far behind in this task—until today there is hardly a city of any size without almost hopeless congestion within its boundaries and stalled traffic blocking roads leading beyond these boundaries.
>
> A solution can and will be found through the joint planning of the Federal, state, and local governments . . . .

The election campaign, of course, turned on other issues.

With the Korean War and other matters vying for his attention in 1953, the new President did not take any noteworthy steps on highways until 1954. He signaled his intentions in his State of the Union Address on January 7, 1954. His goal, he said, was "the building of a stronger America." He described what he had in mind:

> A nation whose every citizen has good reason for bold hope; where effort is rewarded and prosperity is shared; where freedom expands and peace is secure—that is what I mean by a stronger America . . . . We mean to build a better future for this nation.

He outlined the Administration's plans to sustain a strong economy, which included "public-works plans laid well in advance." On the subject of national highways, the President said:

> To protect the vital interest of every citizen in a safe and adequate highway system, the Federal Government is continuing its central role in the Federal Aid Highway Program. So that maximum progress can be made to overcome present inadequacies in the Interstate Highway System, we must continue the Federal gasoline tax at two cents per gallon. This will require cancellation of the ½ cent decrease which otherwise will become effective April 1st, and will maintain revenues so that an expanded highway program can be undertaken.

At a White House ceremony on May 6, the President signed the Federal-Aid Highway Act of 1954, a traditional 2-year authorization, as Members of Congress who had crafted the bill looked on. He said he was pleased that it worked within the framework of the Federal-State partnership under the Federal-aid highway program, that its total of $2 billion was the highest ever for Federal-aid highways, and that it represented a rough linkage of gas tax revenue and highway authorizations. He explained:

> In recent years the nation has accumulated tremendous highway needs which are becoming increasingly acute. Our highways badly need modernization and expansion to accommodate today's vastly increased motor traffic . . . . This legislation is one effective forward step in meeting these accumulated needs.

He added that, "the needs are so great that continued efforts to modernize and improve our obsolescent highway system are mandatory."

The Federal-Aid Highway Act of 1944 had authorized a 40,000-mile "National System of Interstate Highways," but had not provided additional funds for its construction. The assumption was that the State highway agencies would recognize the importance of this new network and use their regular Federal-aid fund apportionments to build their segments. Most States preferred to address their own priorities rather than build new roads for travelers from other States.

By the 1950s, Congress was ready to turn back to consideration of the Interstate System, but the amounts authorized initially were inadequate. The Federal-Aid Highway Act of 1952 had authorized only a token amount, $25 million a year for fiscal years (FY) 1954 and 1955, for Interstate construction at the traditional Federal-State matching share of 50-50. The 1954 Act increased funding only to $175 million a year, with the Federal share 60 percent, for FYs 1956 and 1957.

(The Excise Tax Reduction Act of 1954 (March 31, 1954) extended the excise tax on gasoline to April 1, 1955, and the Tax Rate Extension Act of 1955 (March 30, 1955) extended it to April 1, 1956.)

President Eisenhower was one of the people who understood the limitations of the legislation. Even as he hailed the 1954 Act in public, he was running out of patience with the pace of highway planning within his Administration. The Interstate System, he thought, would provide stimulus during economic downturns. He told his staff that he did not want to "get tagged like [former President Herbert] Hoover did, unjustly, of not doing anything to help in economic bad times." [Ambrose, Stephen E., *Eisenhower: The President*, Simon and Schuster, 1984, p. 158]

He had good reason to understand the value of roads, good and bad. In 1919, he had participated in the U.S. Army's first transcontinental convoy of military motor vehicles. The convoy began with a ceremony at the Ellipse in Washington south of the White House and drove north to Gettysburg, Pennsylvania, where it turned west to arrive in San Francisco 2 months later. From Gettysburg, the convoy followed the Lincoln Highway, the Nation's most famous road, although the drivers needed scouts in some locations to determine where it was. The convoy encountered mud, ruts, inadequate bridges, blowing sand, steep grades, vehicle breakdowns and crashes, and interminable speeches in every town that welcomed the soldiers.

During World War II, General Eisenhower observed the autobahn network of expressways that Germany had built in the 1930s. Prior to the war, they had been the envy of highway engineers and politicians in the United States. Now, the express highway network demonstrated its value during the war to Germany and in its aftermath to the victorious allies.

Years later, former President Eisenhower recalled the impact on these experiences on him:

> I think that every officer on the convoy had recommended in his report that efforts should be made to get our people interested in producing better roads. A third of a century later, after seeing the autobahns of modern Germany and knowing the asset those highways were to the Germans, I decided, as President, to put an emphasis on this kind of road building . . . . This was one of the things that I felt deeply about, and I made a personal and absolute decision to see that the nation would benefit by it. The old convoy had started me thinking about good, two-lane highways, but Germany had made me see the wisdom of broader ribbons across the land. [Eisenhower, Dwight D., "Through Darkest America with Truck and Tank," *At Ease: Stories I Tell to Friends*, Doubleday and Company, Inc., 1967, p. 166-167]

In an address scheduled for July 12, 1954, to the Governors' Conference, President Eisenhower intended to talk about these experiences as background for his ideas on improving the Nation's roads. Due to a death in the family, he was unable to attend, but Vice President Richard M. Nixon delivered the address from the President's notes. The Vice President, on the President's behalf, challenged the Governors to join in a $50 billion "grand plan for a properly articulated system that solves the problems of speedy, safe, transcontinental travel -- intercity communication – access highways – and farm-to-market movement – metropolitan area congestion – bottlenecks – and parking."

The Grand Plan involved each level of government, Federal, State, county, and municipal, improving the roads under its jurisdiction. The centerpiece would be "a program initiated by the Federal government, with State cooperation, for the planning and construction of a modern State highway system, with the Federal government functions, for example, being to advance funds or guarantee the obligations of localities or States which undertake to construct new, or modernize existing highways." This would be the Interstate System.

President Eisenhower asked retired General Lucius D. Clay to head the President's Advisory Committee on a National Highway Program. The Clay Committee, as it was commonly called, would work with the Governors to develop a plan for submission to Congress. The President asked General Clay to devise a plan that would be "self-liquidating" in that it would generate the revenue to pay for itself – by which the President appears to have meant toll roads – and would not add to the national debt.

The President submitted the Clay Committee's plan to Congress in February 1955. To finance the Interstate System, the President proposed a bond program similar to the concept MacDonald had mentioned. A new Federal corporation would issue $30 billion in bonds, with the Federal gas tax dedicated to retiring the bonds over a 30-year period. The bond revenue would be collected in advance of a 10-year Interstate construction program and would be doled out as needed.

This plan proved too controversial for Congress in 1955, primarily because of the debt feature. It promised funds upfront to build the Interstate System in about 10 years, but included large amounts of debt that would tie up gas tax revenue to repay wealthy investors with interest over 3 decades.

The Senate approved a plan developed by Senator Al Gore, Sr. (D-Tn.), chairman of the Subcommittee on Roads, Committee on Public Works, that authorized funds for the Interstate System but did not include a means of financing it. Under the Constitution, such plans had to originate in the House of Representatives. Later that year, the House rejected the President's plan. Then, to the shock of most observers, the House also rejected a plan developed by Representative George H. Fallon (D-Md.), chairman of the Subcommittee on Roads, Committee on Public Works, based on highway user taxes. Highway interests, especially truckers, objected that highway users should not have to pay exclusively for a plan that provided general benefits to all Americans, including those who did not own a motor vehicle.

In 1956, Congress returned to highway user tax revenue as a direct means of paying for the Federal-aid highway program on a pay-as-you-go basis. The question was how to do so.

On January 26, 1956, Chairman Fallon released H.R. 8836, the Federal Highway Act of 1956. The new Fallon Bill called for $24.8 billion to complete the 40,000-mile National System of Interstate and Defense Highways in 13 years as well as increased Federal-aid for the primary, secondary, and urban programs. It proposed a pay-as-you-go program, with the details on tax changes to be worked out by the Ways and Means Committee under the leadership of Representative Hale Boggs (D-La.).

During a January 31 meeting with Republican legislative leaders, the President abandoned the Clay Committee's plan and endorsed the pay-as-you-go financing method. Representative Joseph W. Martin, Jr. (R-Pa.,), who had been Speaker of the House from January 3, 1953 to January 3, 1955, and was now House Minority Leader, announced the President's decision, summing it up by saying, "We want the roads as fast as we can get them." Rose pointed out that following the meeting, Eisenhower told his aides to "yield to Democratic insistence on financing" and "cooperate in the development of an appropriate tax proposal."

Already, Speaker of the House Sam Rayburn (D-Tx.) told reporters, bipartisan agreement had been reached on a plan to increase the gasoline tax from 2 to 3 cents and to increase taxes on tires and tubes. Some details remained to be worked out, he said, but "I just know we aren't going to get any roads unless we put in some decent taxes." [Odlin, William S., Jr., "President Approves Program Urged by Congress Democrats," *Transport Topics*, February 6, 1956]

On February 6, Representative Boggs introduced H.R. 9075, the Highway Revenue Act of 1956, containing the financing mechanism. It was based on an estimate that the Interstate System and the existing Federal-aid highway program (other than for Federal domain roads, such as roads in National Parks, which were funded out of the general Treasury) would cost approximately $35 billion over 15 years. All the revenue from highway user taxes would be set aside for highway purposes. The committee report explained:

> The legislation will set aside for highway purposes all of the revenues now derived from gasoline, diesel guel, special motor fuels, and tires and inner tubes. This represents a vast increase in the present approximately $700 million per annum from these sources now being used for highway purposes.
>
> Over the 15-year period of the program it is estaimted that almost $22 billion of the approximate $35 billion required will be derived from existing revenues.
>
> We have after much study written in exemptions from the proposed increase in taxes. These exemptions would include bus transportation systems operated within metropolitan areas, fuels and tires which are used on vehicles which are not highway vehicles, and the farmers' exemption provided for in legislation recently pass by the House of Representatives.
>
> Every study indicates the tremendous [need] for the proposed highway program, both from the point of view of the economic development and security of the Nation.

The bill was, according to Representative Boggs, the result of "intensive studies" by his staff, the Joint Committee on Internal Revenue Taxation, the Treasury Department, and BPR. [Highway Revenue Act of 1956, Hearings Before the Committee on Ways and Means, U.S. House of Representatives, 84th Congress, 2d Session, 1956, p. 6]

The reaction to the Fallon and Boggs Bills was generally favorable, although the Administration and some of the interest groups had reservations

The House Ways and Means Committee held hearings on the Boggs Bill in mid-February. Secretary Humphrey, the first witness on February 14, confirmed that President Eisenhower had endorsed the pay-as-you-go concept, which he said would be far preferable to the Clay Committee's bond proposal. However, he was convinced that the taxes Boggs had proposed would be about $12 billion short of the amount needed for a 12-year program covering the Interstate System and the other Federal-aid systems. [Highway Revenue Act of 1956, p. 11]

He agreed additional tax revenue would be needed and suggested taxes to be considered, but resisted repeated requests by committee members to endorse specific taxes to close the gap. He explained some of the difficulties associated with linking all highway user taxes for highway purposes:

> Mr. Boggs, if what you want to do is to dedicate, to try to be logical and to dedicate, as you say, all of the taxes that have to do with automobiles or road use of any kind and you want those to go into this pot, you will deplete our general revenues, which you gentlemen have voted for us to spend by that amount of money . . . . You cannot switch money out of our general revenues that you have already authorized us to spend and that is being spent, and put that money out of that pot, and not put it back . . . . Under any guise or theory or anything else, it won't work. [Highway Revenue Act of 1956, p. 23]

With Representative Boggs becoming increasingly exasperated by Secretary Humphrey's refusal to endorse specific highway user tax changes, the Secretary replied:

> I have given you a list of all of the things [taxes] that have been suggested to me, or that I have heard suggested, and given you the ratios at which you can tax them. Now, it is not my function . . . to pick out who shall pay these taxes. I think this is the job of the Ways and Means Committee . . . . Now it is up to you to figure it out. Who is the proper fellow to put the burden on? [Highway Revenue Act of 1956, p. 24]

The next questioner, Representative John W. Byrnes (R-Wi.), immediately began asking the Secretary about the linkage:

> Mr. Byrnes. Now, do you have any procedure to accomplish this dedication, so that as far as these new taxes go and the present tax on gasoline and diesel, so that they do not in the future get mingled up with general fund operations, and we know where we are going as far as actual revenues for road purposes?
> Secretary Humphrey. I would suggest this, Mr. Byrnes, that we follow a practice similar to the practice that is followed for the social security and the other funds, and that we do not get to the physical earmarking of funds, but that we do as we do with those funds; that we estimate the amounts to be collected in these categories, and that those amounts be deposited in a special fund to the credit of a special fund; that the withdrawals then be made from that fund; that credits in that fund shall not be credits to the budget; but that deficits in

> that fund shall be deficits in the budget . . . . If I have made myself clear, I think that is the proper way to handle the accounting for these funds.
> Mr. Byrnes. Can that be done administratively? Or should that mechanism be worked into the legislation itself?
> Secretary Humphrey. I suppose it should be indicated in the legislation how it would be handled. There is no new plan at all. It is exactly the way we handle the funds today, the other funds . . . .
> Mr. Byrnes. We do not handle it that way insofar as any road funds at the present time are concerned.
> Secretary Humphrey. No. I suppose that is an item that should be covered properly in the legislation. [Highway Revenue Act of 1956, p. 25-26]

Questioning shifted to other subjects, but Representative Aime J. Forand (D-RI) returned to the trust fund idea:

> Mr. Forand. I wonder if I interpret correctly what you have been telling us to mean that you would set up a separate fund, to be known as the highway building fund, to which all these taxes we talked about would be dedicated, and only used for highway purposes.
> Secretary Humphrey. They would be credited. That is correct. [Highway Revenue Act of 1956, p. 33]

Representative Herman P. Eberharter (D-Pa.) brought the subject up again during his questioning of Secretary Humphrey:

> Mr. Eberharter. Mr. Secretary, is not the proposal here to earmark revenue receipts for special purposes?
> Secretary Humphrey: This is not earmarking, Mr. Eberharter. I would not recommend earmarking. I am talking about handling this about the same way as we handle the trust funds.
> Mr. Eberharter. Isn't that earmarking?
> Secretary Humphrey. No, trust funds are not exactly earmarked. There is a provision for the estimating of amounts and the crediting of accounts. And I would handle these the same way we do trust funds.
> Mr. Eberharter. If all of the revenue receipts from gasoline and fuel and lubricating oil, for instance, would go into a special trust fund, is that not exactly the same as earmarking it? That is the only thing you could spend it for.
> Secretary Humphrey. The only reason I shy away from the word "earmarking" is that there are all kinds of technical definitions of earmarking. Let us just stick to saying, "We will handle them the same way we handle the other funds."
> Mr. Everharter. The way we handle general funds?
> Secretary Humphrey. No, no. The trust funds.
> Mr. Eberharter. I want to shy away from that earmarking, myself, if I possibly can.
> Secretary Humphrey. That is right. What is technically earmarking I do not think is required, or desirable. [Highway Revenue Act of 1956, p. 36-37]

The committee acted on Secretary Humphrey's advice. In revising the bill following the hearings, the committee included a provision establishing a Highway Trust Fund. Based on the committee's data, the trust fund was expected to be self-financing over a 16-year period (an extra year was added in response to the Secretary's concern that 15 years would not be sufficient). Provision was made to obtain advances from the general funds of the Treasury to meet temporary deficits in the trust fund. The advances would be repaid when sufficient trust fund revenues became available. In addition, the bill committed Congress to bringing about a balance of receipts and expenditures of the trust fund for the entire period; if a balance would not be obtained, Congress was to enact legislation to bring about such a balance.

The Fallon bill became Title I of the Federal-Aid Highway Act of 1956, while the Highway Revenue Act developed by the Ways and Means Committee became Title II. The House approved the bill on April 26, 1956, by a vote of 388 to 19.

The House bill went to the Senate where Title I was modified by the Committee on Public Works to incorporate features of the Gore bill. The Committee on Finance considered Title II. Chairman Harry Flood Byrd (D-Va.) introduced a unique feature to the Highway Revenue Act. A lifelong highway booster, Senator Byrd was also a lifelong pay-as-you-go man with a nearly pathological hatred of debt, whether private or public. He had been one of the strongest opponents of the President's debt-based plan and now he feared that highway expenditures might exceed Highway Trust Fund revenue, creating debt that general taxpayers would have to satisfy. To address this problem, he added what came to be called the Byrd Amendment. It provided that if the Secretary of the Treasury determined that the balance in the Highway Trust Fund would not be enough to meet required highway expenditures, the Secretary of Commerce was to reduce the apportionments to each of the States on a pro rata basis to eliminate the estimated deficiency.

The Senate approved the revised Federal-Aid Highway Act of 1956 on May 29 by voice vote after a 14-hour session.

After a Conference Committee reconciled the House and Senate bills, Congress approved the Federal-Aid Highway Act of 1956 on June 25. President Eisenhower signed the legislation on June 29. In addition to launching the program to construct the Interstate System, the 1956 Act authorized the Highway Trust Fund as a way of assuring motorists that their highway user tax revenue would be dedicated to highway and bridge construction, not any other purpose. As Representative Boggs had said during the Ways and Means Committee hearing:

> I think the only way you can justify this proposal [to increase excise taxes on highway users] to the people is that you are using revenues for the first time substantially the same as you are collecting to build highways. In other words, we are now going into the concept of a user tax. [*Highway Revenue Act of 1956*, p. 31]

In 1957, the Department of the Treasury credited nearly $1.5 billion in highway user tax revenue to the Highway Trust Fund, and over $2 billion in 1958.

The word “ trust” allowed highway officials to assure motorists paying this tax that their payments would be used exclusively to improve the Nation’s roads. Maintaining that trust, even in the early years, would not be easy.

Part 1:
The Sacrosanct Trust

Such a large pot of money was a tempting target from the start.

Roscoe Turner, chairman of the American Legion's aeronautics committee, was one of the first to stake a claim for a share of the revenue. In *Planes*, the magazine of the Aircraft Industries Association, Turner proposed that part of the Highway Trust Fund revenue be used to construct small airfields. Only about a third of the country's 15,000 urban areas were accessible by air. Extending aviation's reach would benefit the general economy. As for tapping the Highway Trust Fund, Turner saw several advantages:

- The same kind of machinery is used for both kinds of construction;
- It would be possible to acquire the small amount of land needed for the airstrips at minimum cost if it were purchased at the same time highway rights-of-way were acquired;
- The airstrips would be invaluable not only for general aviation purposes but also as emergency fields for airline use; and
- In a civil-defense emergency every part of the country would be accessible by air even if highways and railroads were destroyed or congested because of enemy action. ["Road Money for Airfields?" *Better Roads*, February 1957, p. 4]

Turner's proposal was not adopted. (In 1969, President Richard M. Nixon proposed a "designated account" for airport and airway programs. With the Highway Trust Fund in mind, Congress instead approved the Airport and Airway Trust Fund to reserve air user tax revenue for to improve air service, approved by President Nixon on may 21, 1970 (Public Law 91-258).)

The Department of Labor was more successful in tapping into the Highway Trust Fund.

Under Section 115 of the Federal-Aid Highway Act of 1956, the Department of Labor had been charged with determining prevailing wage rates for Interstate construction projects in accordance with the Davis-Bacon Act. Before 1956, the Davis-Bacon Act had applied to federally funded highway projects only if a Federal Agency was the contracting agency, as was the case with BPR's work for other Federal Agencies, such as the National Park Service and U.S. Forest Service. However, the Public Works Committee had voted to apply the provision to the Interstate System at the request of Senator Richard L. Neuberger (D-Or.), who argued, "We don't want coolie labor building our interstate highways." Congress had agreed, after much debate, that laborers and mechanics working on the Interstate System, but not other Federal-aid highway projects, would be subject to the Davis-Bacon Act's prevailing wage requirements.

In November 1956, the Labor Department's Solicitor, Stuart Rothman, explained that the use of prevailing wages "had been a stabilizing influence in the construction industry and at the same time a bulwark of protection for the working man against substandard wages." The Labor Department issued 23,000 wage determinations in the year before enactment of the 1956 Act. In addition, over 1 million craft minimums were established for federally financed or assisted construction projects. Despite the new work necessitated by the 1956 Act, Rothman assured the highway community that the Labor Department "is determined to carry out its responsibilities . . . in full accordance with the spirit of the law and the intent of Congress, making every effort to avoid unnecessary delays in letting of highway contracts because of the wage determination process." [Rothman, Stuart, "The Role of the Department of Labor in the Interstate Highway Program," *Road Builders' News*, November 1956, p, 4]

To support this work for the Interstate System, the Labor Department requested an appropriation of $365,000 from the Highway Trust Fund for FY 1958 for salaries and expenses in the Office of the Solicitor. The 1956 Act had opened itself to this diversion by providing interim funds to the Labor Department to administer the Davis-Bacon Act because the Labor Department's appropriations act for the year (FY 1957) had passed before Congress decided to apply the prevailing wage law to the Interstate System.

When the Labor Department's FY 1958 Appropriations Act came before the House, Representative Boggs rose in opposition:

> I submit that this completely and totally violates every concept of the highway trust fund. The highway trust fund was created by this body in order to assure the motoring public of our country that the billions of dollars collected from highway users would be devoted to the purpose of constructing highways.
>
> As a matter of fact, we had heard for many years . . . complaint after complaint about the diversion of funds collected from highway users, to other purposes. So in order to assure the taxpaying motoring public that we would build highways out of the funds derived from the taxes that they paid to use those highways, we created a trust fund.

The legislation specifically allowed for payment of BPR's general administrative expenses – spelled out by name to avoid "any conceivable mistake."

The Davis-Bacon Act, Boggs pointed out, had been enacted in the 1930s:

> Since that time we in this Congress have provided that its provisions were to apply to many projects, yet never have we provided that the funds necessary for administering this Davis-Bacon Act with respect to specific projects were to be provided out of any other fund than the appropriation of the Department of Labor itself. Why now can it be thought that the Congress intended to make taxes levied for the purpose of building roads available to the Department of Labor for the administration of the Davis-Bacon Act?

In a colloquy with Representative Boggs, Representative Fallon asked:

> Mr. Fallon. Did we not in all of our hearings before your committee and our committee promise the people who are the users of these highways and who are going to pay these taxes that every dollar would be used for construction?

> Mr. Boggs. Yes, we did. That was one of the principal arguments for the enactment of this legislation.

Further, including the proposal in an appropriations act would improperly modify a provision of an authorizing act, which Boggs pointed out "is in direct violation of the rules of the House." He had to admit, in response to a question, that "it is against the rule to legislate in the Committee on Appropriations, but you did it all the time. I agree with that." ["Diversion of Highway Trust Funds Debated," *American Road Builder*, April 1957, p. 15, 25-27]

Despite this discussion, the House included the $365,000 in the appropriations act for the Department of Labor.

In the Senate, the Appropriations Committee made clear that "not one penny" should be diverted from highway construction. The committee asked the Senate's Legislative Counsel for an informal opinion. The opinion stated:

> While it may be argued that the language (of the Highway Act) is broad enough to imply an authorization to use the Trust Fund to defray the expenses of the Secretary of Labor, we do not believe that such a construction should be placed upon (its language) in the absence of a more specific indication of legislative intent.

A broader interpretation would open the Highway Trust Fund to other expenses, such as the expense of the Secretary of the Treasury in managing and operating the fund:

> We believe that the objects for which the Trust Fund moneys are to be expended should be narrowly, rather than liberally, construed.

The Senate Appropriations Committee excluded the requested appropriation and the Senate went along.

In the conference committee to resolve differences between the two appropriations bills, the House stood firm for the $365,000. Senate conferees refused at first, but compromised on $200,000. The conference report became law.

Representative Fallon introduced a bill (H.R. 8648) to close the loophole. In explaining the bill, he referred to the temporary nature of the Federal-aid provided to the Labor Department for the first year:

> I assumed that this year the Labor Department would obtain funds to administer the Davis-Bacon section of the act in the regular way, through the regular departmental appropriation act. I was, therefore, astonished when the Labor Department came back this year seeking another diversion from the trust fund . . . . What the Labor Department has done, as a matter of fact, is to seize the opportunity to crawl through a legal loophole. I think that this loophole ought to be closed tightly. ["Fallon Bill Designed to Prevent Highway Trust Fund Raids," *American Road Builder*, July-August 1957, p. 33]

He was even clearer when he addressed the First General Session of the American Road Builders Association (ARBA) convention on January 20, 1958. He and his colleagues in the House Ways and Means Committee had thought, he said, "that this Fund was highly protected." The Labor Department's successful raid had "greatly disturbed" highway advocates in the Congress. "I denounced it then and I denounce it now." As bad as that was, he said, after seeing the Administration's Federal Budget proposal for FY 1959, "it appears we were talking about peanuts." He explained:

> What is now proposed is that $32 million collected from a Federal tax of aviation gasoline be diverted from the Trust Fund to the General Treasury; that another $32 million for Forest and Public Lands Highways now financed from the General Treasury be financed in the future by the Trust Fund; that the Treasury Department be paid $3.75 million for administering the Trust Fund; and that the Department of Labor receive $250,000 for administering the Davis-Bacon provision . . . .
>
> There is practically no end to the clever devices which may be employed to milk money intended for the Interstate Program.

He summarized his view: "Don't tamper with the Trust Fund." [Fallon, George H., "After 18 Months – What's Next," *American Road Builder*, February 1958, p. 12]

Senator Gore told ARBA that he also objected to the raids:

> The Highway Trust Fund was established to remove from the financing of this program the uncertainties of annual appropriations procedures. The Congress proposed to say to the states and to the industry: "You can count on using these specified revenues for highway purposes."
>
> We in the Congress thought at the time that the Administration had also agreed to the concept.

He cited the "misapplication" of funds for the Labor Department and the Administration's budget proposal to "grab about $68 million from the Highway Trust Fund":

> I object to these raids on the Highway Trust Fund in order to make pretense of a balanced budget. Should the Congress approve these proposed withdrawals and deletions from the Trust Fund, there will be other suggested diversions. Instead of a Trust Fund in the true sense of that word, we will have a grab bag which might be a useful gadget for the Director of the Budget but of diminishing value for the building of highways.
>
> I will oppose vigorously these efforts to divert from the Highway Trust Fund any part of the revenues previously designated for that purpose. I hope a majority of the congress will concur.

At the urging of Representatives Boggs and Fallon, the House rejected the attempt to divert $3.5 million to the Treasury Department. They tried, successfully on this occasion, to enforce the longstanding principle against legislating in an appropriations act. In addition, Congress rejected the proposal to shift the responsibility for funding park, forest, and Indian Reservation roads to the Highway Trust Fund.

Representative Boggs made his views clear in an address to the 7th Highway Transportation Congress in 1958:

> As chairman of the subcommittee which drafted the tax provisions [of the 1956 Act], I was convinced that this Trust Fund would be regarded as its name implies, as a sacred trust and that the billions of dollars which would move into the Fund could only be used for highway purposes . . . .
>
> In my judgment, we made a solemn promise that every nickel of that tremendous sum would be utilized exclusively for the purpose of constructing roads, acquiring right-of-way and paying administrative expenses of the Bureau of Public Roads . . . .

He pointed out that Section 209(f) of the 1956 Act made these restrictions explicit by providing that expenditures from the Highway Trust Fund "shall be available . . . to meet those obligations of the United States heretofore or hereafter incurred under the Federal-Aid Road Act approved July 11, 1916, as amended and supplemented, which are attributable to Federal-aid highways (including those portions of general administrative expenses of the Bureau of Public Roads payment from such appropriations)."

He summarized attempts, particularly by the Department of Labor, to secure revenue from the Highway Trust Fund even though such a payment "violated the intent and the letter" of the 1956 Act.

Representative Boggs described how on March 4, 1958, the House was considering the Treasury-Post Office appropriations bill, which incorporated a presidential recommendation to provide $3.5 million from the Highway Trust Fund to pay the Department of the Treasury for expenses incurred administering the Fund. He had raised a point of order that the bill was an improper attempt by an appropriations act to change an authorizing act. When his point of order was upheld after spirited debate, he said, "I have never enjoyed an experience more in my whole tenure in the House of Representatives." He was certain he had established a precedent that would prevent similar raids. [Boggs, Hale, "A Sacred Trust," *Highway Highlights*, May-June 1958, p. 34-36]

Attempts to "raid" the Highway Trust Fund would continue, with perennial issues including the public lands expansion and restoration of aviation gas tax receipts to the General Fund. By 1961, another idea was to use Highway Trust Fund revenue to pay homeowners forced to move because of highway construction. The highway community fought these efforts to divert funds from construction even as the projected cost of the Interstate System increased from an estimated $27 billion in 1956 to $41 billion in 1961 (Federal share: $37 billion).

The Transit Crisis

While the highway community and Members of Congress fought diversion of Highway Trust Fund revenue, mass transportation was reaching a crisis. Through the 1950s, private companies provided most transit service, including commuter rail, but the companies faced growing financial pressure as their passengers relied increasingly on their cars. As transit historian Professor George M. Smerk explained about the 1950s:

> Virtually no thought was given to investment by government in transit; after all, except in a very few places, it was a private enterprise responsibility . . . . Even if a sharp and notable crisis was lacking, transit was not a happy place to be in the 1950s because of the constant erosion of ridership. Management's natural reaction was to enter a cycle of service cutbacks and fare increases which further discouraged riders and ridership. Eventually, the process came to feed on itself. Many smaller cities lost service entirely, and transit service was becoming lackluster in medium-sized cities . . . .
>
> Railroad commuter services were often provided by cars that had been built in the World War I era, or even earlier. The railroads could not be blamed because there was no profit to be found for the privately owned railroads that operated all the commuter roads. [Smerk, George M., *The Federal Role in Urban Mass Transportation*, Indiana University Press, 1991, p. 47-48]

Often, the companies were despised by their customers and local officials as service, especially to low income areas, declined and occasional corruption scandals erupted. Further, from a Federal perspective, transit was a local problem, not a national concern. Congress was not ready to use Federal funds to pay for capital expenditures or subsidize operating deficits.

In Philadelphia, a new Democratic leadership under Mayor Joseph S. Clark, Jr., identified transportation as one of the tools for the city's revitalization. The city's network of electrified commuter rail, rapid transit, streetcars, and light rail was in decline. As Smerk explained:

> Sadly, over the years there had been little modernization of either the facilities or the equipment; the visible elements of plant and equipment had grown shabby and patronage had been slipping. By the 1950s, the lack of investment had become acutely obvious and was particularly severe for the commuter railroads . . . . Understandably, there was no incentive for them to invest in their services or to make any changes other than taking cost-cutting steps or raising fares . . . . [Smerk, p. 55-56]

Mayor Clark established the Urban Traffic and Transportation Board in 1953 to investigate the city's problems. In 1955, the board recommended a coordinated road and rail program that included upgrading and extending rail service. "The program," Smerk said, "appeared to be a hopelessly expensive undertaking indeed, especially because the city of Philadelphia had neither the money nor the jurisdiction to do the job." The surrounding jurisdictions were unwilling to contribute, while the State legislature was dominated by rural interests with highway ties. [Smerk, p. 56]

Mayor Clark left office after one term on January 2, 1956, and campaigned successfully for election to the U.S. Senate, which he joined on January 3, 1957. His successor, Mayor Richardson Dilworth, continued the search for answers to the city's transit problem. In 1956, he talked with Federal officials about diverting some of the city's highway funds to mass transportation:

> The mayor ran into strong opposition from highway groups. Dilworth then proposed an alternate plan in which highway funds would be used only for the planning and engineering work in designing mass transit systems. Dilworth suggested a federal lending agency modeled on the Federal National Mortgage Association to provide the capital funds needed for construction.

Representative William J. Green, Jr. (D-Pa.) introduced the bill in 1957 but as Smerk explained, it was "well ahead of its time and the unprecedented bill . . . expired quietly in committee without attracting much notice." [Smerk, p. 56-57]

These early attempts to use revenue from the Highway Trust Fund for mass transportation alarmed the highway community. Major General Louis W. Prentiss, ARBA's executive vice president, sounded the alarm in the June 1957 issue of ARBA's magazine, *American Road Builder*. He described a recent meeting in Chicago of civic planners, municipal engineers, and transit operators to explore mass transit options as the solution to the survival of cities. Whether they were talking about buses, trolleys, monorail, subway, or surface rapid transit, the primary issue was how to make transit attractive enough to convince motorists to abandon their cars.

Prentiss did not dispute the value of mass transit or of building express facilities on Interstate right-of-way. The cost was another matter:

> These were the multimillion dollar questions raised but not answered at the Chicago meeting. However, *it seemed to me that time and again covetous eyes were directed toward the Highway Trust Fund* . . . . [Regardless of the merits of mass transit] we must resist all attempts to divert money from the Highway Trust Fund for any transit uses . . . . If those who seek to solve the mass transportation problems of the metropolitan areas would recognize that Congress does not intend to permit the Highway Trust Fund to be diverted to purposes or objectives other than those specifically stated . . . and would look to other sources of funds for financing, I am sure that the entire highway industry would gladly cooperate with them in seeking a satisfactory and early solution to these problems. [Prentiss, Louis W., "Mass Transportation a Problem—But . . ." *American Road Builder*, June 1957, p. 6-7, emphasis in original]

Although cities around the country continued to have problems with their mass transportation network, the focus in the late 1950s was on highways:

> In local government, most American cities had no position on what should be done about mass transportation, and their actions often did more to hinder effective mass transportation service than to help it. Planners, downtown business interests, labor, civic interest groups, and academics who were interested in urban affairs were either ignorant, uninterested, or

> unable to take a position on transit. Virtually all transportation-related interest continued to focus on highways, a form of transportation for which there was great political, financial, and popular support . . . .
>
> In 1958, there arose the kind of crisis that always appears necessary to force various groups together in order to gain action. Oddly enough, the whole process that eventually led to the development of a federal role in urban mass transportation got underway inadvertently, as Congress strove to provide some legislative relief for the nation's railroads. The law of unexpected consequences was at work almost before anyone noticed. [Smerk, p. 58]

The freight railroads had long subsidized unprofitable passenger service with profits from freight. In the 1950s, as more cargo shifted to trucks, rail profits declined, creating pressure for relief from the unprofitable passenger service. Congress addressed the problem by passing the Transportation Act of 1958 (Public Law 85-625, approved August 12, 1958), which provided a mechanism for the railroad companies to discontinue passenger service. Almost immediately ("almost before the ink was dry," according to Smerk), the railroad companies began targeting commuter rail services for discontinuation. "Unexpectedly, legislation aimed at helping the railroads had become the vehicle for a major threat to the commuter rail portion of urban mass transportation." [Smerk, p. 61]

Although a Federal law had touched off the crisis, the Eisenhower Administration was convinced that transit was a local problem, not one the Federal Government should invest in. Pressure for Federal help would have to come from the cities. Mayor Robert Wagner of New York, Mayor Richard J. Daley of Chicago, Mayor Dilworth, and representatives of other cities met in Chicago in January 1959 with officials of commuter rail companies. Participants from the east favored a Federal role while those from the west, where the commuter rail lines were in better shape, were reluctant to seek Federal help, fearful that it might lead to a Federal takeover of the railroads.

In March 1959, Mayor Dilworth and others initiated a study that the American Municipal Association (AMA) issued late in the year. *The Collapse of Commuter Service* summarized the declining prospects for commuter railroads and broader mass transportation service. In December 1959, during AMA's annual congress in Denver, the group adopted a resolution calling for Federal support for alternatives to highways, including long-term, low-interest loans to help cities buy equipment and refurbish facilities.

Mayor Dilworth worked with James Symes, president of the Pennsylvania Railroad, to develop a legislative proposal that called for tax relief for commuter rail lines, low-interest loans by the Department of Commerce for capital improvements, and a study of grants for rail rapid transit. The proposal received as little consideration as the earlier bill that Representative Green had introduced.

Seeing that working through the highway-oriented Commerce Department and the Public Works Committees had been a tactical error, Mayor Dilworth and his colleagues decided to shift their focus to finding a way for Federal urban renewal and redevelopment programs to cover mass transportation. They found a champion in Senator Harrison A. "Pete" Williams, Jr. (D-NJ), who had served in the U.S. House of Representatives (1953-1957) before winning election to the Senate in 1958. Smerk said of Williams:

> Williams was an ambitious man, a freshman in the Senate in 1960, and he was seeking an issue or role he could play that would be important to his New Jersey constituents and still possess relatively broad national interest. Williams found his issue in mass transportation . . . .
>
> Williams and his staff went to work on a new strategy for the transit legislation, and they made alterations to the Dilworth and Symes legislative proposal. The first strategic move was to shift the bill from the venue of the Department of Commerce by offering the legislation as a measure for urban areas rather than as a transportation program. That was, the legislation would fall under the jurisdiction of the Housing and Home Finance Agency, which in 1960 was the nearest thing to a Department of Urban Affairs within the federal government. The legislation would then be under the jurisdiction of the Senate [Committee] on Banking and Currency, of which Williams was a member.

The Williams bill, S. 3278, proposed to offer $100 million in loans (down from $500 million in the Dilworth-Symes bill) and emphasized a focus on urban mass transportation programs, not just commuter rail. The Senate approved the bill on June 27, 1960, and forwarded it to the House of Representatives, but it never emerged from House committee consideration. [Smerk, p. 70-71]

Nevertheless, Mayor Dilworth, the AMA, and officials from other cities were encouraged by the prospects for their new approach and the prospects under President John F. Kennedy, who took office on January 20, 1961.

While cities sought Federal assistance, transit continued its gradual decline:

> But the transit industry as a whole stayed at least marginally profitable until the mid-1960s; it was a last hurrah, and probably specious at that. It is not an unfair statement to say that the "profits" of the transit industry, however marginal they may have been in some places, were due in part to a failure to maintain fixed plant and equipment adequately. [Smerk, p. 47-48]

Cities became convinced that public agencies could do a better job than the private sector of providing needed transit service. Through the 1960s, cities converted private transit to public operation and then searched for funds when costs almost inevitably exceeded farebox revenue. Smerk described the transition:

> Counteracting the image of mass transit as primarily a big-city concern was the slow but steady failures of private mass transit firms in all parts of the U.S. and in cities of all sizes. The industry in the aggregate ceased to be profitable in the mid-1960s for a variety of reasons. The growing inflation of the late 1960s was a serious blow to an industry that was fairly labor intensive. The cost of living was rising, and transit labor costs rose sharply as new contracts with transit workers' unions were hammered out. The cost of equipment and supplies also began to go up substantially, likewise due to inflation. If service was to be maintained, there was a limit to how much fares could be boosted and service cut. The aging fleet of transit vehicles grew inevitably older and more expensive to maintain, and

> there was little or no money in the transit property coffers for new equipment that was less costly to maintain. Marginal private operators all over the nation began to go out of business. An increasing number of cities—large, medium, and small—found that they would have to get into the transit business themselves if service was to continue. Slowly, pressure began to mount on Congress to augment the mass transit programs. The lobbying groups for cities began to take note of the transit problems expressed by their members. [Smerk, p. 110-111]

As President Kennedy took office, ARBA's Prentiss again warned his colleagues that, "Any diversion destroys the pattern of fairness and equity which we are at such pains to achieve" in fair taxation of highway users:

> Some have argued that the highway user is a proper source of tax revenue to be used to subsidize commuter rail transit, on the theory that public support for all modes of transportation should come from some common pool of funds. The Highway Trust Fund is apparently the handiest pool. The fallacy in the argument lies in the fact that the Highway Trust Fund itself cannot be justified except as a means to the fair and equitable distribution of the highway tax burden.
>
> Wherever tax support for another mode of transportation is proposed, it is not unreasonable to look to the beneficiaries of that mode of transportation to supply the necessary revenue. Commuter rail transit, for example, benefits not only the individual riders, who pay fares, but also the downtown business establishments and the suburban communities which are served by the facility. These indirect beneficiaries contribute to the support of general government through various general taxes. The Highway Trust Fund, consisting of special taxes, should not be tapped for non-highway purposes. [Prentiss, L. W., "Highway Funds for Highways," *American Road Builder*, January 1961, p. 17]

In view of the increased estimate of the cost of the Interstate System, ARBA told readers of its magazine:

> If new requirements are made of the fund, it will prove to be inadequate to carry the increased load. In the interest of a continuing long-range program, it is essential for ARBA to guard against encroachments on the Highway Trust Fund.

After listing the usual potential encroachments, the article added, "Some argue that highway user taxes collected for the Trust Fund should be used to help provide rail transit facilities for commuters. If unchecked, raids on the Trust Fund can wreck the highway program." ["ARBA Looks to the Future," *American Road Builder*, July 1961, p. 7]

Federal Highway Administrator Rex M. Whitton, a highway engineer who had risen through the ranks to become Missouri's Chief Engineer before President Kennedy appointed him to the Federal post, discussed transit eligibility for Federal-aid highway funds in a reply dated June 20, 1962, to an inquiry from Senator Williams:

> With respect to the specific questions in your letter, I should like to answer first the one with respect to provision of right-of-way for rail transit in the median of freeways, for here we have a firm precedent. We cannot legally participate with Federal-aid highway funds in the cost of any right-of-way required for rail transit, nor in any additional cost that may be involved in the increase in length of structures crossing the freeway necessitated by the space occupied by the rail line. Other costs, such as increased cost of utility relocation that results from the rail line, would likewise be ineligible.
>
> This decision on participation with highway funds resulted from discussions in connection with the present or potential use by rail transit of medians in freeways in the Chicago area. The position was mutually acceptable to the State and local government agencies, and to the transit interests. There is also recent substantiation of this position by the Congress, through its action in authorizing the National Capital Transportation Agency to acquire land in or in connection with freeways in the Washington area for use for rail transit lines where its studies show them to be desirable.
>
> We believe that this position with respect to rail transit is sound, mutually acceptable and practicable of administration. However, we feel that as a general rule, rail facilities in a major highway median strip are not efficient, safe or desirable.

The use of freeways by buses was "quite a different matter." Bus operators contributed to the Highway Trust Fund and they operated highway vehicles. "They do and should use the highways, and where the public interest warrants, we feel that appropriate special provision for their operation can be made with highway funds." Whitton explained:

> While we cannot state rigid rules covering all eligible or ineligible items, in general we regard any special roadways, widening, acceleration or deceleration lanes, or stopping areas over which buses operate as eligible. Special features such as stairs or shelters provided for the benefit of the bus passengers alighting from or boarding the buses would be ineligible. We should expect that the bus operator would be able to give assurance of reasonable use of such facilities if they are to be provided. We would have to consider each case on its merits, rather than to set inflexible standards or conditions.

As for exclusive bus lanes on freeways, Whitton wanted to consider each case on its merits, but be wrote that in general, "I believe that in the public interest we should expect that the bus operator be able to give assurance that more passengers not only <u>can but will</u> be moved in a reserved lane by buses than would be served by passenger cars alone during the time it is so reserved." Such assurances would have to emerge from "the findings of comprehensive urban transportation studies of the type now being widely conducted in the major metropolitan areas." [Underlining in original.]

Whitton added that BPR had long been "strongly impressed by the potential of the motor bus in urban transportation." Proper coordination between bus operators and highway officials "offers real opportunity to reduce the demand for private vehicle use." Buses could "nearly match" the private vehicle for "flexibility as to termini, route, and schedule" better than rail or other fixed forms of transit:

> [Buses] can adjust readily to changing urban transportation demands. And since it is a highway vehicle, provision for its use can properly be made from highway user revenues, and thus avoid entirely, or substantially reduce, the enormous fixed capital investment required for other forms of public transport.

Representative Fallon remained vigilant. In 1962, for example, he appeared before the House Subcommittee on Interior and Insular Affairs to object to the diversion of as much as $8 million to establish a Land Conservation Fund to acquire land for public outdoor recreation and other conservation uses. The diversion involved refundable but unclaimed taxes on fuel used in motorboats. He said he supported the proposed Land Conservation Fund, but opposed the use of highway user tax revenue:

> [While] the proposed diversion is relatively small, the principal at stake is extremely important. Once the precedent is established that the Highway Trust Fund can be tapped for nonhighway purposes, we will no longer be assured of long-term continuity of revenue, or of continued equity in the distribution of the tax load. Without these assurances, the Trust Fund concept is of little value.

He justified the motorboat fuel revenue going into the Highway Trust Fund because the owners of the boats haul their boats on the roads or travel on roads to where their boats are docked:

> Thus, I see no inequity in the present arrangement. But even if I did, I would be reluctant to adopt a piecemeal approach to amending the revenue legislation supporting the Highway Trust Fund. ["Congressman Fallon <u>Once More</u> Defends the Trust Fund," *American Road Builder*, August 1962, p. 2, emphasis in original]

Another diversion had been taking place all along, as Prentiss explained in a report to ARBA members:

> As a matter of fact, the Trust Fund is being tapped now, by means of state and local taxes applied to construction contracts and gross receipts of contractors, and sales taxes on highway materials. These taxes are, of course, reflected in contractors bid prices, so that in the case of an Interstate system contract the Federal Government actually pays 90 per cent of the taxes from the Highway Trust Fund. The cost to the Highway Trust Fund is at least $40 million per year, and it may be more. [Prentiss, L. W., "The Annual Report," *American Road Builder*, March 1963, p. 14]

Prentiss acknowledged that this problem would be hard to solve.

Still, diversion for transit was the biggest concern, as Representative Fallon made clear in a February 1963 speech to ARBA's 61st annual convention. He did not object to rail transit; he noted that he commuted from Baltimore to Washington every day by rail:

> The problem is that the rail transit operators are seeking relief in two directions—increased subsidies from federal, state and local governments, and decreased competition from motor vehicles.

> Their plan, in some cases, includes curtailment of urban freeway construction and the substitution of rail lines. To this, I object.
>
> I am strongly opposed to any mass transit proposal which would have the effect of limiting, curtailing or slowing down established federal aid highway programs . . . .
>
> In seeking sources of money for rail transit expansion, the transit enthusiasts are casting covetous eyes on the Highway Trust Fund. They reason that if less highways are needed, there will be a surplus of money in the Trust Fund which will be available for nonhighway purposes. Of course, one way to avoid such a surplus would be to reduce highway-user taxes, but that isn't mentioned. As a matter of fact, the transit boosters are in favor of making automobile travel expensive enough to make people want to ride the trains to work.
>
> It is highly important that the Highway Trust Fund not be tapped for nonhighway purposes. [Fallon, George H., "Rapid Progress Is Important," *American Road Builder*, May 1963, p. 9-10, emphasis in original]

Representative Boggs, sponsor of the Highway Trust Fund provision in the 1956 Act, was equally opposed:

> Some have sought to amend the Highway Trust Fund to channel funds into improving transit systems in the great urban centers. I am unalterably opposed to this concept. The Trust Fund must be utilized for highway purposes. Once the Fund is violated, every department of government will make some claim on it. I have striven to prevent this from happening in the past, and I intend to fight such moves in the future. [Boggs, Hale, "The Trust Fund: Its Present, Its Future," *American Road Builder*, April 1964, p. 17]

Even as the highway community fought to keep transit out of the Highway Trust Fund, the Federal Government took its first steps toward a role in mass transit.

The breakthrough occurred on June 30, 1961, when President Kennedy signed into law the Housing Act of 1961 containing three provisions related to mass transit. It authorized $25 million for mass transportation demonstration projects, with local governments responsible for one-third of the cost; added mass transportation as part of comprehensive urban planning; and authorized $50 million in loans for capital improvements at low interest rates. The loans could not go directly to a private company at a time when private companies still provided most transit service; the loans had to be channeled through a government agency. Smerk said of the legislation:

> The mass transit portion of the Housing Act of 1961 was a modest start for the federal transit program, especially when compared with the high hopes of the coalition that had worked so hard to get the program enacted. The dollars were small: despite the $75 million authorization, only $42.5 million was appropriated to pay for the demonstrations and the loans. Even so, it was a start, a foundation to build upon. Even if the new law did not provide grants of capital and money to help pay operating expenses for financially troubled

> transit properties, the 1961 Act offered eventual hope for more favorable action in the future.

Smerk added, “The Act of 1961 in and of itself did not do much to help the sagging fortunes of urban commuter railways or mass transit systems.” [Smerk, p. 80-81]

President Kennedy’s Messages on Transportation

In August 1957, the country had slipped into a recession that increased unemployment to over 7 percent and reduced corporate profits by 25 percent by April 1958. To stimulate the economy, Congress passed the Federal-Aid Highway Act of 1958, which increased Federal-aid highway authorizations but without a change in taxation to boost revenue. It also suspended the Byrd Amendment for 2 years and temporarily increased the matching share from 50 percent to two-thirds.

President Eisenhower approved the 1958 Act on April 16, citing “the desirability of speeding up construction of our badly needed system of Interstate Highways” and “the hope that in the acceleration of work on this system and on the other federal-aid highway programs some impetus may promptly be given to public and private efforts to increase employment.” These benefits overcame his reservations about “grave defects” in the bill, such as the increased Federal share and advances to the States to help finance their share of Federal-aid primary, secondary, and urban system projects. He also pointed out:

> It will be necessary for the Congress in its next session to return to the subject of highway legislation in order to provide funds for the enlarged federal assistance under this Act. Its action at that time should accord with the sound principles that established the Trust fund as a means for keeping federal-aid highway expenditures on a self-sustaining basis.

The bill became law just as the short recession was ending.

With expenditures now exceeding income to the Highway Trust Fund, President Eisenhower recommended a temporary 1½-cent increase in the gas tax to maintain the Interstate construction schedule. The Federal-Aid Highway Act of 1959 (approved September 21, 1959) added only a penny, making the gas tax 4 cents a gallon. The temporary increase was to expire at the end of FY 1961 on June 30, 1961.

On February 28, 1961, just 5 weeks after taking office, President Kennedy sent a Message to Congress on the Federal Highway Program. It began, "Our Federal pay-as-you-go highway program is in peril" and focused on funding options for putting the program back on a sound financial footing. He cited the revised estimate issued in January showing that the total cost of the Interstate System would be $41 billion, with a Federal share of $37 billion. To keep the Interstate System on schedule and continue other Federal-aid highway programs, the Nation needed $11.56 billion in additional authorizations or about $900 million more a year through FY 1972 to keep the program on a pay-as-you-go-basis.

Completing the Interstate System "at least as fast as originally scheduled is essential to our economy." He opposed "stretching out or cutting back" the program, two options that critics had suggested. Instead, he recommended making the temporary 4-cent gas tax permanent.

The President's message also addressed urban development issues. "A Federal Highway program of this scope cannot be isolated from other programs for social and civic improvement, particularly our progress in urban renewal and planning. More effective use of both highway and urban renewal funds can result from increased coordination . . . ." He had, therefore, directed Secretary of Commerce Luther H. Hodges and Housing and Home Finance Administrator Robert C. Weaver "to increase their joint planning at every level, to improve coordination of urban renewal and freeway construction plans in the same area, and to invite the cooperative efforts of State and local highway and housing officials and private experts."

Federal urban renewal law, enacted in 1949, required that every contract for Federal assistance include provisions assuring the availability of decent, safe, and sanitary housing at reasonable prices in suitable locations for all families displaced by urban renewal projects. This law did not apply to the Federal-aid highway program. President Kennedy recommended legislation to help families displaced by highway construction find "reasonable housing at reasonable costs, a problem that he said "has been largely overlooked."

After he submitted legislation on March 14 to achieve these and other purposes, Congress acted quickly. On June 29, exactly 5 years after President Eisenhower had approved the landmark 1956 Act, President Kennedy approved the Federal-Aid Highway Act of 1961 "with the greatest pleasure." The new law made the 4-cent gas tax permanent and adjusted other excise taxes to provide the revenue needed to complete the Interstate System. It also adjusted remaining authorizations for the Interstate System to a total of $25.2 billion over 9 years. With State matching funds, the legislation accounted for $27 billion in funding for the remainder of the program through FY 1971, the same amount Congress had thought in 1956 would be the total cost of the program.

Secretary Hodges and Administrator Weaver submitted their recommendations to the President on March 28, 1962. "Transportation," they said in the transmittal letter, "is one of the key factors in shaping our cities." They continued:

> The major objectives of urban transportation policy are the achievement of sound land-use patterns, the assurance of transportation facilities for all segments of the population, the improvement in overall traffic flow, and the meeting of total urban transportation needs at minimum cost. Only a balanced transportation system can attain these goals—and in many urban areas this means an extensive mass transportation network fully integrated with the highway and street system.

They agreed that highways are vital but believed that an increased emphasis on mass transit was needed in urban areas, especially in view of declining transit service in recent years. Comprehensive planning was the key to achieving good urban transportation:

> One of our main recommendations is that Federal aid for urban transportation facilities should be made available only when urban communities have prepared or are actively

> preparing up-to-date general plans for the entire urban area which relate transportation plans to land-use and development plans.

Their recommendations reflected these views. Planning should be a continuing process involving all agencies and jurisdictions within the urban community; coordinated with policy making and administration; and part of a systematic consideration of land use and development. It should focus on planning the system as a whole, not just its individual elements.

The Institute of Public Administration had advised them that capital requirements for mass transportation in the next decade totaled $9.8 billion. In considering how to find this amount of funds, they said:

> Mass transportation must be viewed as a public service and often cannot be a profit-making enterprise. While mass transportation is provided on a more of less limited scale in hundreds of localities, it is generally not possible to support a large-scale investment program from the fare box. But the price to the community and the Nation of inadequate mass transportation can be uneconomic uses of land and higher than necessary costs of public facilities, excessive travel, and increasingly aggravated congestion at peak hours.

Local governments often have limited resources and ability to raise taxes, making substantial Federal aid a necessity.

Among their recommendations were proposals for a $500 million, 3-year program for mass transit grants, with $100 million authorized in FY 1963. The Federal share of project costs should be two-thirds. An emergency program should be available to pay one-half the cost of projects to meet urgent needs where an existing facility or service would otherwise no longer be available. The Federal loan program should continue.

They recommended that the Federal-aid highway program "continue undiminished" because it was "contributing substantially to the solution of the urban transportation problem." Freeways, as well as new and improved streets and highways, were "an essential part of the urban transportation program." The report did not recommend increased funding, but did say that "greater flexibility in the use of Federal-aid highway funds to meet urban transportation needs can be provided" by allowing Federal-aid secondary funds to be used on urban extension of secondary routes and by providing room in Federal-aid highway right-of-way for exclusive use of specific types of motor vehicles, such as rail lines and buses. Combined right-of-way could be effective, but "the additional cost occasioned by the rail facilities could not be borne by highway funds."

The joint report indicated that BPR had agreed to permit the exclusive use of highway lanes by buses, encourage sharing of highway right-of-way with rail transit, and emphasize that highway planning should promote adequate traffic control systems, parking facilities, and circulation systems for city streets commensurate with traffic volumes expected on freeways and major arterials.

The report included several recommendations for urban highway programs, the most important of which involved planning:

> Beginning not later than July 1, 1965, approval of Federal-aid highway programs for projects in any metropolitan area should be made contingent upon a finding by the Secretary of Commerce that such projects are consistent with adequate, comprehensive development plans for the metropolitan area or are based on results of a continuing process carried on cooperatively by the States and local communities and that the Federal-aid system so developed will be an integral part of a soundly based, balanced transportation system for the area involved.

Secretary Hodges and Administrator Weaver also recommended relocation assistance for those displaced by highway or mass transit projects and additional funds for research and demonstration projects in urban transportation and especially mass transportation. "It is essential to stimulate and support experimentation with new equipment and systems to test their practicality and demonstrate their effectiveness in improving and reducing the total cost of urban transportation."

They concluded their transmittal letter to the President by saying:

> We are convinced that the program proposed herewith will contribute significantly to the welfare of our people and the sound growth of our economy.

["Urban Mass Transportation Act of 1962," *Congressional Record-Senate*, September 13, 1962, p. 19339-19343]

On April 5, 1962, President Kennedy submitted a message to Congress on "The Transportation System of our Nation." The message began:

> An efficient and dynamic transportation system is vital to our domestic economic growth, productivity, and progress. Affecting the cost of every commodity we consume or export, it is equally vital to our ability to compete abroad. It influences both the cost and the flexibility of our defense preparedness, and both the business and recreational opportunities of our citizens. This Nation has long enjoyed one of the most highly developed and diversified transportation systems in the world, and this system has helped us to achieve a highly efficient utilization of our manpower and resources . . . . Transportation is thus an industry which serves, and is affected with, the national interest.

The message was a broad statement that covered a wide range of topics, including freight shipments by land, air and water; international aviation and maritime issues; and labor relations for transportation workers.

President Kennedy summarized a national transportation policy:

> The basic objective of our nation's transportation must be to assure the availability of the fast, safe and economic transportation services needed in a growing and changing economy to move people and goods, without waste or discrimination, in response to private and public demands at the lowest cost consistent with health, convenience, national security and other broad public objectives.

The users of transport facilities, he said, “should be provided with incentives to use whatever form of transportation . . . provides them with the service they desire at the lowest total cost, both public and private.” He favored “continued reliance on unsubsidized privately-owned facilities, operating under the incentives of private profit and the checks of competition to the maximum extent practicable.”

The section on urban transportation explained that changes in where people lived and worked had changed the patterns of urban travel:

> Higher incomes coupled with the increasing availability of the automobile have enabled more and more American families, particularly younger ones with children, to seek their own homes in suburban areas. Simultaneously, changes and improvements in freight transportation, made possible by the development of modern highways and the trucking industry, have reduced the dependence of manufacturers on central locations near port facilities or railroad terminals. The development of improved production techniques that require spacious, one-story plant layouts have impelled many industries to move to the periphery of urban areas. At the same time the importance of the central city is increasing for trade, financial, governmental and cultural activities.

In the past, transportation networks were organized to permit travel to and from downtown. Now, travel within urban areas was "increasingly diverse" and less geared to fixed mass transportation systems:

> This drastic revision of travel patterns in many urban areas has seriously impaired the effectiveness and economic viability of public mass transportation, which is geared to the older patterns. A steady decline in patronage and a concomitant rise of unprofitability and financial problems have occurred. This has been particularly true of rail commuter and streetcar services limited to particular routes by fixed roadbeds.

President Kennedy based his recommendations on the Hodges/Weaver report. He recommended that Congress establish a long-range program of Federal-aid to urban mass transportation ($500 million over 3 years) in the form of direct grants to public agencies for rights-of-way, fixed facilities, including maintenance and terminal facilities, and rolling stock, as well as extension and rehabilitation of existing systems and creation of new systems. Only substantial, continuing Federal support "can induce our urban regions to organize appropriate administrative arrangements and to meet their share of the costs of fully balanced transportation systems." The President also proposed authorizing the Housing and Home Finance Agency to make emergency grants over the next 3 years to meet urgent needs for any existing mass transportation facility or service that otherwise might end.

Because highways would remain an "instrumental part" of urban transportation, the President asked Secretary Hodges "to make his approval of the use of highway planning funds in metropolitan planning studies contingent upon the establishment of a continuing and comprehensive planning process." He also recommended a change in Federal law to make Federal approval of a program for highway projects in any metropolitan area contingent on the Secretary's finding that the projects are "consistent with comprehensive development plans for the metropolitan area and that the Federal-aid system so developed will be an integral part of a soundly based, balanced transportation system for the area involved."

In addition, the President reiterated his concern about "the problems of families displaced by new highway construction." He cited Secretary Hodges' estimate that 15,000 families and 1,500 businesses were being displaced by Interstate construction each year. In the interest of equity, President Kennedy recommended that "assistance and requirements similar to those now applicable to the urban renewal program be authorized for the Federal-aid highway program and the urban mass transportation program." Legislation was being submitted "to authorize payments not to exceed $200 in the case of individuals and families and $3,000 . . . in the case of business concerns or nonprofit organizations displaced as a result of land acquisitions under these programs." (The payment for businesses could be higher based on moving costs.)

In conclusion, the President recognized that transportation problems were deep and could not be quickly or easily solved. "But few areas of public concern are more basic to our progress as a nation." The time had come for Congress and the Executive Branch to seek solutions:

> The difficulty and the complexity of these basic troubles will not correct themselves with the mere passage of time. On the contrary, we cannot afford to delay further. Facing up to the realities of the situation, we must begin to make the painful decisions necessary to providing the transportation system required by the United States of today and tomorrow.

Senator Williams and transit interests saw the Housing Act of 1961 as launching a temporary program; they hoped to mobilize support for legislation in 1962 that would provide more funds on a permanent basis as a result of President Kennedy's recommendations.

Smerk summarized hearings in the House and Senate on legislation embodying the President's ideas:

> These hearings were generally successful in pointing out the need for federal aid and gave evidence of support for the measure from various urban interest groups.
>
> The support was not as broad or deep from urban political leaders as might have been expected, save for the coalition of big-city mayors . . . . At the time of these early hearings the great majority of transit was still provided by unsubsidized private firms. To political leaders in most American cities transit embodied at best a troublesome fight on fare increases; in some places it was a continual succession of owners as properties changed hands in an effort on the part of some owners to get out of the transit business in the best financial shape possible. In contemplating more federal action in transit, Congress was actually ahead of most city leaders who were, if possible, in the main less than indifferent to the plight of transit and the thought of providing financial aid . . . .
>
> In addition, there was no strong, well-organized antagonism; the strongest opposition came from the Chamber of Commerce of the United States and the American Farm Bureau Federation. Both of these groups possessed deep philosophical reservations about federal

> programs on the local level . . . . The opponents recited the litany of free enterprise and no enlargement of government spending. Labor gave cautious support to the proposed transit legislation but expressed a short-sighted concern over the possible loss of jobs that might result from improved and more efficient transport systems. The loss of the right to strike was a concern if the program encouraged an increase in municipal ownership of transit companies. Automotive interests also gave cautious approval, taking care to point out that mass transportation and the private automobile were complementary to one another and that there was a laudable and necessary—though limited—role for mass transportation. They were, however, firm in resisting any diversion of highway user fees for the support of mass transportation programs. [Smerk, p. 87-88]

The House Committee on Banking and Currency approved a mass transit aid bill on July 3 by a vote of 16 to 7. In doing so, the committee reported that traffic congestion cost $5 billion a year and would only get worse unless more commuters switched back onto buses and trains. The committee estimated that about $9.8 billion would be needed to upgrade mass transit in the Nation's 26 biggest cities. Cities could raise "a large part" of this amount by raising fares, but taxpayers would have to pay the rest. ["Traffic-Jam Costs Placed at $5 billion," *The New York Times*, July 4, 1962]

The Senate Committee on Banking and Currency approved Senator Williams' similar bill on August 3. Senator Williams was encouraged by the fact that Senator Homer E. Capehart of Indiana, the ranking Republican on the committee, voted for the bill. Three other Republicans, including Senator Prescott Bush of Connecticut, voted "no," as did one Democrat, Senator Willis Robertson of Virginia. (Senator Bush was the father of President George H. W. Bush and the grandfather of President George W. Bush.)

Senator Williams was hopeful the House and Senate would approve the measure "within the next few crowded weeks" before Congress adjourned for the November mid-term elections. ["Mass-Transit Aid Gains in Senate," *The New York Times*, August 4, 1962]

The chief obstacle to passage was Representative Howard W. Smith (D-Va.), chairman of the House Rules Committee, which decides which bills go to the House floor for debate as well as the rules of the debate. Chairman Smith, a conservative who used his position to block civil rights legislation and other bills he opposed, objected to the bill because he thought the $500 million price tag was too high coming just before an election.

The Senate, of course, could vote on its bill regardless of whether Chairman Smith allowed a vote in the House. However, congressional leaders were usually reluctant to allow a vote on a bill in only one House; doing so would put members of that House on record, pro or con, on a measure that could not become law but could affect their reelection potential. In this case, Senate Majority Leader Mike Mansfield (D-Mt.) was even more reluctant to bring the Williams bill to the floor for a vote. The schedule was jammed with other bills requiring action before the election, including measures on taxes, trade, and foreign aid that had a chance of passing in both Houses. [Weaver, Warren, Jr., "Transit-Aid Bill Considered Dead," *The New York Times*, September 5, 1962]

Any hope for a Senate vote came to an end on September 13 when Senator Frank. J. Lausche (D-Oh.) introduced an amendment that would require the bill to go through the Committee on Commerce prior to a floor vote. Senator Lausche had been the Mayor of Cleveland (1941-1944) and Governor of Ohio (1945-1946, 1949-1956) before entering the Senate. Although a Democrat, he was a staunch conservative and an opponent of labor unions who never felt bound by party leadership or direction. (By the time he lost his bid for reelection in the 1968 Ohio Democractic primary, he supported the Republican nominee for President, former Vice President Richard M. Nixon, and did so again in 1972.) [Saxon, Wolfgang, "Frank Lausche, Ex-Ohio Senator and Governor for Five Terms, 94," *The New York Times*, April 22, 1990)

Senator Lausche said his primary concern was jurisdiction. The Committee on Banking and Currency had developed and approved the Williams bill, S. 3615, but it dealt primarily with issues assigned to the Committee on Commerce:

> As to Commerce Committee jurisdiction, the 1946 Reorganization Act granted, among other things, jurisdiction over, first interstate and foreign commerce generally; and, second, regulation of interstate railroads, buses, trucks, and pipelines. I respectfully submit that inasmuch as the so-called mass transportation bill would deal with buses and mass transportation systems crossing State lines from New York into New Jersey particularly, it is inescapable that the proper situs for the consideration of the bill is in the Committee on Commerce.

He also objected to the contents of the bill. He and Senator Williams agreed that about 1,300 companies and 60 governments operated transit systems in the United States. By making the aid available only to government bodies, S. 3615 was "the beginning of the transition of the transportation systems into governmental ownership." The inescapable end result would be "a socialization not only of the local systems, but also of the railroad systems of the country."

Senator Williams explained that the bill provided funds only to public bodies because it "requires the greatest degree of cooperation in planning." He explained:

> It cannot be expected that a bus company will undertake coordination of transportation and the comprehensive planning of urban development. So the money would be made available to a governmental authority, a public body. However, under the bill the public body not only can, but must, consider how it can bring private carriers into the coordinated transportation plan.

Senator Lausche was unconvinced:

> I will not stand for it, and will not support it, regardless of the impact my stand may have on my political future. I think it is wrong. It is not in accord with the fight we are making throughout the world against communism. We are trying to preserve the free enterprise system. But this bill does not do that. If this bill is enacted, it will destroy the free enterprise system, first in local transportation, and eventually in the railroad systems . . . . I am not going to be one of the parade which supposedly is going down the easy path and the

> good path, but which is completely in conflict with what our system of government means." ["Urban Mass Transportation Act of 1962," *Congressional Record-Senate*, September 13, 1962, p. 19329-19332]

Unable to resolve the dispute during the debate, the two Senators privately negotiated an agreement that the Senate approved without debate by unanimous consent the following day. The Senate agreed to refer S. 3615 to the Commerce Committee with instructions to report it back to the Senate by noon on Monday, September 24. ["Urban Mass Transportation Act of 1962," *Congressional Record-Senate*, September 14, 1962, p. 19530-19531]

Senator Williams still did not believe the Commerce Committee had jurisdiction, but as *The New York Times* put it, "The sponsors agreed, they explained privately, because they lacked the votes to block the move." ["Senate Shelves Transit Aid Bill," *The New York Times*, September 14, 1962]

According to Smerk:

> In September, Senator Lausche held a one-day hearing that was generally hostile in tone; it was not a matter of wonder that the Commerce Committee reported the bill [on September 24] without recommendation. [Smerk, p. 88]

The bill was, by then, dead. Chairman Smith would not release the bill from the House Rules Committee for a House vote.

On October 4, the Senate approved a 6-month extension of the mass-transit loan program to June 30, 1963. Senator Williams said that about $32 million in loan funds remained available. Following House passage, President Kennedy signed the extension on October 16.

With the 87th Congress due to end early so members could return home to campaign for the mid-term elections in November, prospects for further action on other aspects of the President's message were not good. However, Congress did complete action on the highway portion of the message by passing the Federal-Aid Highway Act of 1962, which President Kennedy signed on October 23, 10 days after Congress adjourned for the year.

The 5-page legislation contained routine provisions, such as increased funds for the basic Federal-aid highway program (the Interstate System had been funded in previous Acts), as well as two provisions President Kennedy's message had requested. Section 5 addressed the growing concern, cited by the President and many critical articles, about relocated individuals and businesses. Before approving a project, the Secretary would have to receive assurances that the State highway agency would provide advisory assistance for displaced families. He also was required to approve Federal-aid participation in relocation payments by the State to displaced individuals, families, business concerns, farms, and nonprofit organizations. The $200 limit for individuals and families and $3,000 for business or nonprofits proposed by the President was adopted.

The most important provision was Section 9, "Transportation Planning in Certain Urban Areas." It addressed the President's call for a means of ensuring that Federal-aid highway and mass transportation projects were part of a comprehensive and balanced urban transportation plan. The provision added Section 134 to Title 23, United States Code:

> It is declared to be in the national interest to encourage and promote the development of transportation systems, embracing various modes of transport in a manner that will serve the States and local communities efficiently and effectively. To accomplish this objective the Secretary shall cooperate with the States, as authorized in this title, in the development of long-range highway plans and programs which are properly coordinated with plans for improvements in other affected forms of transportation and which are formulated with due consideration to their probable effect on the future development of urban areas of more than fifty thousand population. After July 1, 1965, the Secretary shall not approve under section 105 of this title any program for projects in any urban area of more than fifty thousand population unless he finds that such projects are based on a continuing comprehensive transportation planning process carried on cooperatively by States and local communities in conformance with the objectives stated in this section.

This section launched modern transportation planning by calling for what became known as the "3C" process (for continuing, comprehensive, and cooperative). The 3C process remains the core of Section 134, which now contains nearly 20 subsections.

Edward Weiner, in his history of urban transportation planning, explained:

> Two features of the act are particularly significant with respect to the organizational arrangements for carrying out the planning process. First, it called for a planning process in urban areas rather than cities, which set the scale at the metropolitan or regional level. Second, it called for the process to be carried on cooperatively by the states and local communities. Because qualified planning agencies to mount such a transportation planning process were lacking in many urban areas, the BPR required the creation of planning agencies or organizational arrangements that would be capable of carrying out the required planning process.
>
> These planning organizations quickly came into being because of the growing momentum of the highway program and the cooperative financing of the planning process by the HHFA and the BPR.
>
> In addition, the act restricted the use of the 1-1/2 percent planning and research funds to only those purposes. If not used for planning and research, the state would lose the funds. Previously, a state could request that these funds be used instead for construction. This provision created a permanent, assured funding source for planning and research activities. In addition, the act provided that a state could spend another 1/2 percent at their option for planning and research activities. [Weiner, Edward, *Urban Transportation Planning in the US—A Historical Overview*, U.S. Department of Transportation, November 1992, p. 42-43]

BPR worked with AASHO and the American Municipal Association to implement Section 9:

> The BPR moved quickly to implement the planning requirements of the 1962 Federal-Aid Highway Act. Instructional Memorandum 50-263, published in March [27,] 1963 and superseded by Policy and Procedure Memorandum 50-9, interpreted the act's provisions related to a "continuing, comprehensive, and cooperative" (3C) planning process. "Cooperative" was defined to include not only cooperation between the federal, state, and local levels of government but also among the various agencies within the same level of government. "Continuing" referred to the need to periodically reevaluate and update a transportation plan. "Comprehensive" was defined to include the basic ten elements of a 3C planning process for which inventories and analyses were required. [Weiner, p. 44]

Neither Section 9 nor the BPR issuances required urbanized areas to form a permanent planning organization; the Intructional Memorandum called for "a formal procedure." To address the new planning requirements, State and urban area officials formed ad hoc planning committees to reflect the "cooperative" element of the 3C process and hired consultants to gather and process the data. By July 1, 1965, each of the Nation's 224 urbanized area had an urban transportation planning process in compliance with Section 9 of the 1962 Act. [Weiner, p. 47]

(In an oral history, E. H. "Ted" Holmes, BPR's Director of Planning in the early 1960s, recalled a 1962 visit from Paul L. Sitton, who was examiner of transportation programs for the Bureau of the Budget from 1956 to 1964. Sitton handed Holmes a piece of paper:

> It was virtually the '62 Act [3C language]. I looked it over and said, "I like it, that's what we're trying to do. We are doing it in quite a number of cities right now . . . ." I said that there was only one thing I would change. He had used the word "plan" by July 1, 1965, there had to be a plan in place, developed cooperatively by the state and local communities. I said, "Paul, I'm really afraid that we can't do that. I think that with the number of cities there are, I don't think we have the capacity nor do the states to get that done in that length of time." So I put in the words that are there now, "a planning process," that's the only difference in the language that Paul brought over, where he said plan I said planning process. [Oral History interview by Darwin Stolzenbach, 1988 Interstate Highway Research Project, American Association of State Highway and Transportation Officials, Transcript, p. 18-19]

(Sitton served as Deputy Under Secretary of Commerce for Transportation and was the first Administrator of the Urban Mass Transportation Administrator (1966-1969).)

A Profoundly Significant Urban Measure

On January 14, 1963, the first day of the 88th Congress, Senator Williams introduced the Urban Mass Transportation Act of 1963. It was basically the same bill that had failed in 1962. He said:

> It will give municipal officials, agencies, and planners the encouragement and financial assistance needed to make mass transit feasible in our urban-suburban areas. As the history of the declining transit industry indicates, we will produce only talk until we put up the

> money at the Federal level for a comparatively small part of the job that must be done in so many areas of our Nation.
>
> The bill I introduce today is sensible; it is modest; it can do the job.
>
> And it is one of the most important pieces of unfinished business left behind by the 87th Congress.

He summarized the history of the bill, beginning with President Kennedy's statement emphasizing the importance of balancing transportation resources. The Housing Subcommittee of the Senate Banking and Currency Committee had conducted hearings from April 24 to 27, 1962, with only 3 of 50 witnesses opposing the bill. A subcommittee of the House Committee on Banking and Currency conducted "even more extensive hearings." Of 66 witnesses, only 2 opposed the bill. This widespread support, Senator Williams said, was because the 1961 breakthrough housing legislation "gave us reason to hope that a more adequate bill would be passed." This hope was justified by passage of the 1962 legislation in the Senate and House banking committees:

> In the closing days of the session, however, the bill was referred to another committee. Additional testimony was taken; no changes were recommended; but the bill could not be called up to the floor again because of our heavy work schedule at that time.
>
> To make certain that we will have adequate time this year, I am introducing the bill on the opening day of this session.

The need for the bill "has grown more obvious during the past year," as he explained:

> [The] bill would combat a problem of increasingly critical proportions in the United States today. That problem can be summed up in a very direct way: at just the time when we anticipate our greatest period of urban growth, our ability to move large numbers of commuters in rapid transit vehicles is dwindling. Instead, we are relying—even for rush-hour transportation—on automobiles and highways, the most costly and least efficient method of moving people.

The decline of transit was clear. Between 1956 and 1960, bus and street car passengers had declined by about 25 percent, and from 1956 to the present, 363 transit companies had been sold or abandoned. About 60 cities of 25,000 population or more had no public transportation service:

> Over 85 percent of total daily travel in most urban areas today is by automobile. Traffic jams already cost the Nation about $5 billion a year in time and wages lost, extra fuel consumption, faster vehicle depreciation, lower tax yields, and so forth.
>
> There are forgotten people in our cities who cannot rely on automobiles because of disability, age, or other reasons. And yet, they are faced with a decline in public transportation facilities.

Highways and transit were both needed because "our commuter problem today is simply too big to transform it into a feud between the highway people and the transit people." The need for Federal concern and action can no longer be doubted:

> The basic justification for Federal financial assistance for local urban mass transportation systems is that the general welfare and the productivity of our Nation's urban areas are vitally important to the welfare and productivity of our Nation as a whole; the welfare of the citizens in our towns and cities is essential to the welfare of all of our citizens regardless of where they themselves live . . . .
>
> The Federal Government is already deeply committed to providing financial support for our urban areas. For example, the Housing Act of 1961 committed $2 billion for the urban renewal program alone. The job which this program is trying to do will become increasingly difficult unless a greatly accelerated attack can be made upon our urban transportation problems. ["Mass Transportation," *Congressional Record-Senate*, January 14, 1963, p. 214-217]

That evening, President Kennedy appeared before a joint session of Congress to deliver the State of the Union Address. In one section of the speech, he said that, "The quality of American life must keep pace with the quantity of American goods." He listed fundamental premises to accomplish this goal, one of which was that "we need to strengthen our Nation by making the best and the most economical use of its resources and facilities." The first example under this premise was:

> Our economic health depends on healthy transportation arteries; and I believe the way to a more modern, economical choice of national transportation service is through increased competition and decreased regulation. Local mass transit, faring even worse, is as essential a community service as hospitals and highways. Nearly three-fourths of our citizens live in urban areas, which occupy only 2 percent of our land—and if local transit is to survive and relieve the congestion of these cities, it needs Federal stimulation and assistance.

On April 4, the Senate approved the Urban Mass Transportation Act of 1963 by a vote of 52 to 41.

Despite this promising start, the bill ran into problems in the House, as Professor Smerk summarized:

> In the House there was trouble; southern representatives, in an effort to retaliate against the Kennedy administration's civil rights program, took on an anti-urban stance. It was felt that there was a good chance the House version of the bill would never get out of committee.
>
> The impatient had much to be fidgety about. The House version of the bill remained in committee for more than a year, but in real fact the House Rules Committee [which held hearings in June 1963] was not responsible for the delay. The bill was held in the Rules Committee because House Speaker John McCormack [D-Ma.] felt that if the bill did come up for a vote on the floor of the House, it stood a good chance of being defeated. There were two good strategic reasons for the speaker's reluctance; one was the need, for the

> transit bill's sake, to wait for a propitious moment. The second was political wisdom on the part of McCormack regarding more important legislation . . . .

Following the assassination of President Kennedy, President Johnson called for passage of the late President's stalled legislation, beginning with the civil rights legislation:

> Speaker McCormack was fearful he would jeopardize the Johnson administration's reputation for legislative success by bringing the urban mass transportation bill to the floor prematurely.

The fact that the mass transit bill was still not on the White House's "must pass" list by April 1964 "set into motion an unusual train of events" that went back to 1963 when the House of Representatives voted down a bill to construct a rapid transit system in the District of Columbia. "Labor lobbyists in Washington, in a virtual explosion of short-sightedness, were persuaded to bring pressure against Congress to defeat the bill as an anti-labor measure."

This defeat convinced transit supporters that in 1964, they would need a coordinated lobbying effort, particularly in the House, to get the Williams bill approved. They formed the Urban Passenger Transportation Association (UPTA) to lobby on behalf of "central city interests, the transit industry, the railroads, and organized labor (which was now firmly in the camp of transit as long as there was a *quid pro quo* in the legislation that protected jobs)."

When President Johnson learned that labor was supporting this effort, he added the mass transit bill to the White House's priority list:

> With the UPTA group successful in impressing the White House, the problem then became one of persuading enough congressmen to vote in favor of it to assure passage. As in all things political, success means having enough votes. The speaker had to be shown that there were sufficient Republican votes from northern urban centers to offset the predicted loss of Southern Democrats opposed to the transit bill because of their fear of more (after civil rights legislation) federal incursions into local matters.

With assurances from UPTA in early May that as many as 40 Republicans would vote for the bill, Speaker McCormack allowed the bill out of the Rules Committee, but still hesitated to schedule a floor vote:

> The speaker, yearning to keep the momentum of legislative success rolling on, could hardly be blamed for his foot-dragging, because late in May the House Republican Policy Committee took a firm party stand of direct and unalterable opposition to the mass transit bill. The Republican Policy Committee rarely digs in its heels when it fears defections from G.O.P. ranks, but UPTA had been busy lining up Republican support and the transit lobbyists felt they had enough votes to get the transit bill passed.

Representative William B. Widnall, a Republican who represented a district based in Hackensack, New Jersey, finally forced Speaker McCormack to bring the bill up for a vote:

> Widnall threatened to embarrass both Speaker McCormack and the White House; he promised to call a press conference to indicate that there was Republican support sufficient to pass the bill and at the same time denounce the speaker and the White House for obstruction of legislative procedures. [Smerk, p. 88-90]

On June 23, President Johnson held a press conference, during which he pressured Republicans to reduce obstacles to about 30 bills "that we think are desirable" and that "we would like to see acted upon." He listed many of the bills, including the mass transit bill and the pending Federal-aid highway bill.

The following day, the House began debating the measure. Despite strong opposition (Representative Oliver P. Bolton (R-Oh.) called the bill "the keystone in the arch of Federal domination and control of every town in this country"), the House passed the bill 212-189 on June 25, with 39 Republicans joining 173 Democrats in support of the bill. *The New York Times* speculated on the bipartisan support:

> Some observers professed to see President Johnson's influence in the fact that 34 Southern Democrats, including seven from Texas, voted for the measure. All eight of the 10 Georgia representatives present for the vote supported the bill.
>
> Another major factor in the measure's support among Southern and rural members was its sponsorship in the Congressional session by Representative Albert Rains, Democrat of Alabama. His advocacy made it seem less of a "big city" proposal . . . .
>
> Credit for assembling the bill's majority also goes to a coalition of national organizations in the fields of transportation, housing, planning and urban affairs, which conducted a thorough campaign among House members.

President Johnson congratulated House members of both parties and hailed House approval as "a major step forward in cooperation between Federal and state governments on urban problems." [Weaver, Warren, Jr., "$375 Million Transit Bill Passed by House, 212-189," *The New York Times*, June 26, 1964]

On June 30, the Senate approved the House version of the Williams bill, 47 to 36. The major new feature involved $375 million over 3 years for capital grants on a short- and long-term basis. The amount in the original Williams bill had been reduced from $500 million because the White House claimed that no more than $375 million could be spent during the 3-year period. No State could receive more than $47 million over the 3-year period. The long-term funds could be used for any capital project except highway construction. Short-term aid was available to keep troubled transit properties in operation while local officials planned a replacement service. The legislation continued the demonstration program initiated by the Housing Act of 1961, but expanded it to include research, development, and demonstrations initiated by the Housing and Home Finance

Agency. It also continued the little-used loan program launched in 1961, but it would remain little used. [Smerk, p. 92-93]

On July 9, 1964, President Johnson approved the Urban Mass Transportation Act of 1964 during a signing ceremony in the Cabinet Room of the White House. Guests included Senator Williams, Representative Rains, Administrator Weaver of the Housing and Home Finance Agency, and other Senators, Representatives, Governors, and Mayors.

President Johnson called the legislation "one of the most profoundly significant domestic measures to be enacted by the Congress during the 1960's." He put the measure in historical context:

> Our Constitution empowered Congress to provide for post roads. Since that time, congressional support of transportation has been a major constructive influence on the progress and development of our American society and our American economy.
>
> In the last century, such support of transcontinental railroads and canals and river navigation gave immeasurable impetus to our expansion. Now, in this century, sound congressional policies in support of both highways and airways for automobile and airplane travel has [sic] given incalculable momentum to American progress.
>
> This new act that all of you have contributed to passing remains faithful to this tradition of vision.

Not so long ago, he pointed out, 6 out of 10 Americans lived in rural areas, but now 7 out of 10 lived in urban areas:

> The change has come rapidly and has come dramatically, and today urban congestion is an unpleasant fact of everyday life for too many millions of Americans.
>
> All of us recognize that the curses of congestion in commuting cannot be wiped away with the single stroke of a pen, or 50 pens that we have here. But we do know that this legislation that we are coming to grips with faces the realities of American life and attempts to put in motion a movement to do something about it.

He hoped that this "milestone measure will serve as a beneficial forerunner of many other steps forward in meeting the present challenges of metropolitan life in America." He was, he said, "determined that we will provide the vision and the leadership necessary and that they will no longer be a stepchild and be neglected by their Government in Washington."

New York City Mayor Wagner was in the Cabinet Room for the ceremony. He anticipated using the Federal funds to help with "further extension of our subway system in Queens and possibly other boroughs" as well as another East River tunnel. He also predicted that the aid would provide "much needed assistance" for the New Haven, Long Island, and other rail lines serving New York City. At the same time, he recognized that "there won't be too much for us" in the new legislation. The limit of $47 million per State reduced the value to New York City, which would get that full amount only if no other city in New York State received any grant funds. He hoped that "in the years ahead, the amounts available will be more." [Weaver, Warren, Jr., "President Signs Transit-Aid Bill," *The New York Times*, July 10, 1964]

Professor Smerk said of the Urban Mass Transportation Act of 1964:

> The 1964 Act, in any event, is the cornerstone of the federal transit program. Its aim is to provide aid for the improvement and development of mass transportation and to encourage the planning and establishment of areawide coordinated transport. Along with the planning provision of the Highway Act of 1962, the intention was to offer incentives to plan and develop a rational and integrated urban transportation system combining both the private automobile and mass transportation. [Smerk, p. 91]

Although the Federal role in transit grew under the 1964 Act, needs far exceeded financial resources. Smerk explained:

> One serious problem for cities was that the federal funding of the mass transportation program was uncertain, making intelligent planning difficult. Long-term capital projects, in particular, had a difficult time on the local level because there was no certainty that Congress would appropriate funds for capital grants in the future—or that the funds would be sufficient in magnitude even if granted. The latter factor was noteworthy, given the small sums appropriated for transit up to that time. Consequently, it was very difficult for a city to consider a major transit capital project or issue bonds without some certainty that the federal portion of the money would be there when it was needed for construction purposes. The transit situation was much different from that of the federal highway program: the federal Highway Trust Fund provided a steady and relatively predictable source of money. Moreover, a number of states also had trust-funded highway programs. Even if the federal highway money did not always move with the alacrity that state and local officials might wish, it had the beauty of certainty and it was possible to plan for highways in an effective and efficient fashion that was impossible for transit. [Smerk, p. 111]

Diversion to Transit

For Representative Jonathan B. Bingham (D-NY), who entered the House on January 3, 1965, to represent the Bronx in New York City, the authorized amount for mass transit was "totally inadequate." In March 1965, he announced his intention to introduce legislation that would divert Highway Trust Fund revenue to transit. He pointed out that the highway program would "pump nearly $4 billion annually into highway construction and maintenance," continuing:

> I am unable to see why the Federal Government should contribute such enormous sums of money for the development of an interstate highway system without giving a proportionate share of the money to those city dwellers who have to depend on bus and subway transportation and for whom such transportation is far more essential and plays a much greater part in their lives than the occasional joys of motoring on a super highway.

> I intend shortly to introduce a bill which would give to a city such as New York a choice as to whether the enormous funds contemplated for the highway program should be used for more superhighways or for the improvement of mass rapid transit, or for some combination of the two, as the needs of the community require. ["Diversion of Funds Sought From Roads to Mass Transit," *Transport Topics*, March 15, 1965]

Representative Bingham joined with Senator Joseph D. Tydings (D-Md.), a former State legislator who was in the first year of his only term in the Senate, on July 18, 1965, to introduce the Mass Transportation Financing Act. Their joint statement emphasized that, "We do not oppose the construction of highways." However, they did not believe "that automobiles alone can adequately handle the job of moving large numbers of people back and forth from their homes to jobs, schools, and marketing." Their legislation "would give State governments the authority to use Federal highway subsidies for either road construction or mass transit in whatever proportions they find appropriate to meet their problems." In this way, the legislation would result in a "balanced urban transportation system" that was clearly "the best way to meet our burgeoning transportation needs."

They explained that the purpose of their bill was "no less than the survival of our cities as we now know them." For the central core city to survive, "we must develop more flexible means of access and egress than we possess today." They hoped their bill would make downtowns not only more accessible, but "more pleasant places to work and live." In their view:

> The ideal urban transportation plan, we are convinced, would combine a rapid transit system of high quality with a freeway system adequate to carry the balance of the traffic. Paradoxically, however, the nature of present Federal aid has been such as to predetermine that every community will best be served by a basic reliance on highways. It is our goal to correct this clear imbalance.

They cited several "inescapable" facts:

1. "Our cities are losing commerce and industry because adequate transportation is not available."
2. "Americans traveled an estimated 687 billion miles by car last year, at a total cost of $70 billion. Over 85 percent of the daily travel in most urban areas today is by car."
3. "The social costs of unchecked freeway development are enormous."
4. "Air pollution is another disturbing repercussion of the onslaught of automobiles into our cities."

The Highway Trust Fund had tilted the scales away from transit. The heavy emphasis on highways had shifted people away from transit as service declined. "Let there be no doubt that people will patronize improved transportation systems," if they are available:

> What must be done in order to provide for an integrated transportation service is to correct the gross inequities which exist between the funds available for highways and those available for rapid transit.

The joint statement addressed the frequent argument that highway user taxes are the source of revenue to the Highway Trust Fund, and that motorists contribute it with the understanding that the money will be used for highway construction. They argued that Interstate motorists pay only about a third of the costs of Interstate construction, according to a study of the John F. Kennedy Expressway (I-94 at the time) in Chicago by Parsons, Brinckerhoff, Quade and Douglass. The balance of funding comes from highway users who do not ride on the subsidized highways. The study said:

> The balance of the capital, maintenance and operation costs must be met by taxes on fuel consumed by vehicles operating over roads and streets already completed, some for decades.

Representative Bingham and Senator Tydings concluded from this analysis and other studies that:

> Against this background, the need for a transit subsidy becomes more understandable. A transit system, no matter how popular, how badly needed, or how well planned and operated, can hardly be expected to woo commuters off the expressways without a subsidy so long as the urban freeways themselves, and the parking at their downtown end, continue to be lavishly subsidized.

Their proposal was "in the interest of every automobile owner in every city and metropolitan suburb in the land." Even if a motorist remains on the roads, the switch to improved mass transit will reduce the number of vehicles competing for space, making the remaining motorists' trips "safer, faster, more comfortable, and in every way a more pleasant experience." ["Highways for Mass Transit," *Congressional Record-House*, July 28, 1965, p. 18685-18687]

During a news conference, Representative Bingham and Senator Tydings said they knew their bill faced an uphill battle. The Senator acknowledged that "a great deal of education" would be necessary before their bill would pass. "Hope of passage would depend on the enlightened support of people who have been generally associated with the highway lobbies." Asked if the Administration supported the proposal, Senator Tydings grinned and asked Representative Bingham, "Did Lyndon call you this morning?" Representative Bingham shook his head no. "Potomac Watch" columnist George Lardner, Jr., of *The Washington Post* said:

> They might have to wait a few years to get a White House smile on their idea, too. By then it should be just about ripe. [Flor, Lee, "Road Funds Diversion for Transit Proposed," *The Evening Star*, July 28, 1965; Lardner, George, Jr., "Before Roads and Transit Share Cash There's a Rub That's Causing Friction," Potomac Watch, *The Washington Post*, July 29, 1965]

The U.S. Department of Transportation

The idea of a Federal Department of Transportation has a long history. As early as January 1874, Representative Laurin D. Woodworth (R-Oh.) had called, unsuccessfully, for a Federal bureau of transportation. In April 1919, dozens of technical societies met in Chicago to discuss organization of a public works department that would include the BPR, but their efforts failed as well. Since then, proposals for a Department of Transportation or a consolidation of transportation agencies within the Commerce Department had been made by government study groups, but without a push from the President, the proposals failed.

Each mode of transportation developed in its own time, subject to its own set of laws, regulations, technology, and financing growing out of its unique history. Through the first half of the 20th century, the modes were seen as operating independently. Efforts to coordinate the modes to enhance economic efficiency had begun in the 1920's, but could not overcome the challenge of unifying such disparate enterprises.

By the 1960's, with railroads in decline, air travel still expanding, transit deteriorating, and waterway travel increasingly uneconomical, the highway component of the transportation network seemed dominant – in the Department of Commerce, BPR's highway program consumed half the departmental budget. Moreover, Federal and State highway officials had longstanding relationships with the highway authorizing committees in the House and Senate that sometimes overcame Departmental goals.

On May 22, 1964, during a commencement address at the University of Michigan, President Johnson unveiled his vision of a Great Society:

> The purpose of protecting the life of our Nation and preserving the liberty of our citizens is to pursue the happiness of our people. Our success in that pursuit is the test of our success as a Nation.
>
> For a century we labored to settle and to subdue a continent. For half a century we called upon unbounded invention and untiring industry to create an order of plenty for all of our people.
>
> The challenge of the next half century is whether we have the wisdom to use that wealth to enrich and elevate our national life, and to advance the quality of our American civilization.
>
> Your imagination, your initiative, and your indignation will determine whether we build a society where progress is the servant of our needs, or a society where old values and new visions are buried under unbridled growth. For in your time we have the opportunity to move not only toward the rich society and the powerful society, but upward to the Great Society.
>
> The Great Society rests on abundance and liberty for all. It demands an end to poverty and racial injustice, to which we are totally committed in our time. But that is just the beginning.
>
> The Great Society is a place where every child can find knowledge to enrich his mind and to enlarge his talents. It is a place where leisure is a welcome chance to build and reflect, not a feared cause of boredom and restlessness. It is a place where the city of man served not only

> the needs of the body and the demands of commerce but the desire for beauty and the hunger for community.
>
> It is a place where man can renew contact with nature. It is a place which honors creation for its own sake and for what it adds to the understanding of the race. It is a place where men are more concerned with the quality of their goals than the quantity of their goods.
>
> But most of all, the Great Society is not a safe harbor, a resting place, a final objective, a finished work. It is a challenge constantly renewed, beckoning us toward a destiny where the meaning of our lives matches the marvelous products of our labor.

He would, he said, begin the Great Society in three places—"in our cities, in our countryside, and in our classrooms." Recognizing the population shift to urban areas, he said that "in the next 40 years we must rebuild the entire urban United States," which faced a "catalog of ills," including "the decay of the centers and the despoiling of the suburbs. There is not enough housing for our people or transportation for our traffic." As for the countryside, he said:

> We have always prided ourselves on being not only America the strong and America the free, but America the beautiful. Today that beauty is in danger. The water we drink, the food we eat, the very air we breathe, are threatened with pollution . . . . A few years ago we were greatly concerned about the "Ugly American." Today we must act to prevent an ugly America.

He established 14 task forces of academics, government officials, and prominent citizens to develop policy recommendations. The task forces, which operated in secret, covered such areas as urban problems, pollution of the environment, preservation of natural beauty, and transportation. Their reports, which were submitted to the White House in November 1965, spanned a wide range of ideas, from the practical to the visionary. One aide said, "If we had adopted all their ideas, we would have had to come up with a budget of over $300 billion." For example, one idea was to spend $3 billion on a tube-encased, rocket propelled railroad, capable of traveling 200 miles per hour, between Washington and Boston. [Woods, Randall B., *LBJ: Architect of American Ambition*, Free Press, 2006, p. 557]

President Johnson distilled ideas from his Great Society task forces in his State of the Union Address on January 4, 1965:

> The Great Society asks not how much, but how good; not only how to create wealth but how to use it; not only how fast we are going, but where we are headed. It proposes as the first test for a nation: the quality of its people.

His comments on transportation were limited:

> In a country that spans a continent modern transportation is vital to continued growth.

> I will recommend heavier reliance on competition in transportation and a new policy for our merchant marine.
>
> I will ask for funds to study high-speed rail transportation between urban centers. We will begin with test projects between Washington and Boston. On high-speed trains, passengers could travel this distance in less than 4 hours.

He also addressed urban revitalization:

> An educated and healthy people require surroundings in harmony with their hopes. In our urban areas the central problem today is to protect and restore man's satisfaction in belonging to a community where he can find security and significance.
>
> The first step is to break old patterns--to begin to think and work and plan for the development of the entire metropolitan areas. We will take this step with new programs of help for the basic community facilities and for neighborhood centers of health and recreation.

He called on Congress to create a Department of Housing and Urban Development that would "be needed to spearhead this effort in our cities."

President Johnson's first phase of the Great Society resulted in such legislative successes as the Voting Rights Act of 1965, the Appalachian Regional Development Act of 1965, the Elementary and Secondary Education Act of 1965 (establishing Head Start among other measures), the Social Security Act of 1965 (authorizing Medicare), legislation establishing the National Endowment for the Arts and the National Endowment for the Humanities, and the Highway Beautification Act of 1965.

As the year went on, he decided to explore financing a supersonic air transport (SST). He asked the independent Federal Aviation Agency, as it was called then, for advice, but also called on the Defense Department and private banks for their thoughts. This double check prompted Aviation Administrator Najeeb Halaby to revive the idea of a U.S. Department of Transportation on July 1, 1965, his last day in office. Departmental Historian R. Dale Grinder wrote:

> Frustrated because he thought the Defense Department had locked the Federal Aviation Agency out of the administration's supersonic transportation decision-making, Halaby decided that a Department of Transportation was essential to secure decisive transportation policy development. After four and a half years as administrator, he concluded that the agency could do a better job as part of an executive department that incorporated other government transportation programs. "One looks in vain," he wrote Johnson, "for a point of responsibility below the President capable of taking an evenhanded, comprehensive, authoritarian approach to the development of transportation policies or even able to assure reasonable coordination and balance among the various transportation programs of the government." [Grinder, R. Dale, "The United States Department of Transportation: A Brief History," http://dotlibrary.dot.gov/Historian/history.htm]

Halaby recommended that the new Department incorporate the responsibilities then assigned to the Under Secretary of Commerce for Transportation, and include his own agency as well.

During the summer and fall of 1965, the President established new task forces to recommend ideas for the second phase of the Great Society. The task forces covered pollution control, transportation, urban renewal, population control, education, housing, foreign aid, and civil rights. [Woods, p. 685] On the transportation task force, Charles Schultze, director of the Bureau of the Budget, and Joseph A. Califano, Jr., special assistant to the President, agreed with Halaby. President Johnson also had made clear as early as July 1965 that he supported the idea. [Woods, p. 684] According to presidential historian Robert Dallek:

> The role of the federal government in managing the country's transportation systems was a microcosm of Johnson's views of federal authority . . . In a country as vast as the United States, with a mid-sixties population of nearly 190 million people, Johnson, ever the New Dealer faithful to the conviction that consolidation of control in the executive assured greater economy and efficiency, intended to create a Department of Transportation responsible for all phases of national mobility and safety.
>
> Beginning in 1965, Johnson had made clear to his task force on transportation that he wanted a program that would improve conditions "radically, looking not only to next year, but to 1980, the year 2000 and beyond." Johnson saw a transportation department as not only a chance to "invigorate" and "modernize" the country's transit system but also to do "major things" without costing much money. [Dallek, Robert, *Lyndon B. Johnson: Portrait of a President*, Oxford University Press, 2004, p. 235]

With this support, Schultze and Califano encouraged Under Secretary of Commerce for Transportation Alan S. Boyd, head of the task force, to explore the idea as a possible legislative initiative for 1966. The Boyd Task Force reported on October 22, 1965, in support of the proposal. A new task force, headed by Charles Zwick of the Bureau of the Budget and including representatives of the agencies to be in the new department, was established to draft legislation.

In his State of the Union Address on January 12, 1966, President Johnson proposed steps "to modernize and streamline the executive branch, to modernize the relations between city and State and Nation." The first step was creation of a Department of Transportation "to bring together our transportation activities." With 35 government agencies spending $5 billion a year on transportation, he said, the "present structure makes it almost impossible to serve either the growing demands of this great nation or the needs of the industry, or the right of the taxpayer to full efficiency and frugality." (He also endorsed "a program to construct and to flight-test a new supersonic transport airplane that will fly three times the speed of sound—in excess of 2,000 miles per hour.")

Recognizing that the proposal involved many groups that were comfortable with current arrangements, President Johnson and Califano, Woods said, "spent endless hours with the constituencies involved—railroad executives and unions, truckers, auto manufacturers, shipbuilders, airline industry executives—getting them on board." Woods added, "It was a gargantuan task that perhaps only a person of Johnson's energy and drive could have accomplished." Dallek quoted an anecdote by Califano:

> When Califano reported that the head of the American Trucking Association [sic] was an enthusiastic supporter, the President brightened and said: "'Joe, we're going to get our Department of Transportation! You know why?" I had no idea. He gave me a patronizing look, and almost whispered, "Because of the truckers. When the truckers deal on the Hill, they deal one on one"—Johnson paused for effect and leaned toward me—"and only in cash." He slapped his leg approvingly. [Dallek, p. 235-236]

On March 2, 1966, President Johnson submitted a special message to Congress on transportation. "In a nation that spans a continent," he said, "transportation is the web of union." The "tenuous skein of rough trails and primitive roads" of the Nation's early years had become "a powerful network on which the prosperity and convenience of our society depend." He listed the current system's deficiencies, which in the area of highways included "consuming, frustrating, and wasteful congestion"; "super-highways for super-charged automobiles – and yet [we] cannot find a way to prevent 50,000 highway deaths this year"; a network of "new freeways to serve new cities and suburbs" that "carelessly scars the irreplaceable countryside."

He urged creation of a Department of Transportation "to serve the growing demands of this great Nation, to satisfy the needs of our expanding industry and to fulfill the right of our taxpayers to maximum efficiency and frugality in Government operations."

BPR would be part of the new Department, but the Housing and Home Finance Agency, which administered the Urban Mass Transportation Act of 1964, would remain in the Department of Housing and Urban Development, its home since September 1965. The President said that after creation of the Department of Transportation, he would ask the new Secretary of Transportation to work with the Secretary of Housing and Urban Development to submit proposals on "a unified Federal approach to urban problems."

The bill received bipartisan support in Congress, with the most difficult issue being whether the Maritime Administration (MARAD), then in the Department of Commerce, would be included. Dallek explained that, "Shipowners and maritime labor unions supported by a bipartisan majority in the House wanted to create an independent Maritime Administration that would give special attention to the problems of an ailing industry." Johnson was concerned that this development would undermine the concept of a Department of Transportation:

> If maritime interests could preserve their autonomy, it would boost the case of an independent FAA. "Altogether," Budget Director Charlie Schultze told him, this could "begin a wholesale gutting of the Department bill." To counter such a result, the President promised to give a maritime administrator in a transportation department authority to build "a modern, efficient merchant marine fleet." If the maritime industry went its separate way, it "would be the only major transportation mode not represented in the new Department" and would "not have a voice at the Cabinet table or as a powerful voice in the policy-making councils of Government."

Califano tried to work out a compromise, such as inclusion of a maritime subsidy board and "a special statutory delegation of authority." However, labor and industry objections prevailed. MARAD was excluded from the bill at the insistence of House members. If the White House had not conceded the point, the bill would have failed. [Dallek, p. 235-237]

Senator John L. McClellan (D-Ar.), who was Chairman of the Commerce Subcommittee that would hold hearings on the proposed Department, was another obstacle. He had several objections to the proposal, including concerns about shifting the U.S. Coast Guard and the FAA into the Department. His primary objection, as Johnson understood, was that criteria proposed for new navigation projects built by the U.S. Army Corps of Engineers would hinder the Kerr-McClellan Navigation project transforming the Arkansas River into an inland waterway.

At first, Johnson proposed to deal with McClellan the old-fashioned way, by leaking a story that he was holding up the bill because he wanted to ensure construction of a dam on property he owned. When Califano asked the President if the story were true, Johnson explained that wasn't the point. "You just let John McClellan deny it." [Dallek, p. 236, Woods, p. 689] Instead, Johnson talked directly to the Senator to open a dialogue that resulted in a compromise that allowed the bill to proceed.

President Johnson signed the Department of Transportation Act on October 15, 1966, before about 200 guests at the White House. As Woods noted, "LBJ was so mad at the leaders of the maritime corporations and unions that he did not invite them to the signing ceremony." [Woods, p. 690] He began with a sweeping overview of America's transportation history:

> In large measure, America's history is a history of her transportation. Our early cities were located by deep water harbors and inland waterways; they were nurtured by ocean vessels and by flatboats. The railroad allowed us to move east and west. A thousand towns and more grew up along the railroad's gleaming rails. The automobile stretched out over cities and created suburbia in America. Trucks and modern highways brought bounty to remote regions. Airplanes helped knit our Nation together, and knitted it together with other nations throughout the world. And today, all Americans are really neighbors.

The transportation system was "the greatest of any country in the world," he said, but "we must face facts." The system was "no longer adequate." He explained:

> Today we are confronted by traffic jams. Today we are confronted by commuter crises, by crowded airports, by crowded air lanes, by screeching airplanes, by archaic equipment, by safety abuses, and roads that scar our Nation's beauty.

With the population expected to double over the next two decades, the Nation's future lifeline "is tangled."

The new Department "will have a mammoth task—to untangle, to coordinate, and to build the national transportation system for America that America is deserving of." With its help, "A day will come in America when people and freight will move through this land of ours speedily, efficiently, safely, dependably, and cheaply. That will be a good day and a great day in America."

The new law brought together 31 agencies and bureaus, including BPR, which had by far the largest budget ($4.4 billion) in a Department with a total budget of $6.6 billion. The main elements of the new Department (and where they come from) were:

> U.S. Coast Guard (from Treasury Department)
> Saint Lawrence Seaway Development Corporation (Commerce)
> Federal Railroad Administration (Interstate Commerce Commission's Office of High Speed Ground Transportation)
> Federal Highway Administration (Commerce)
> Federal Aviation Administration (independent)

The legislation began with a Declaration of Purpose:

> The Congress hereby declares that the general welfare, the economic growth and stability of the Nation and its security require the development of national transportation policies and programs conducive to the provision of fast, safe, efficient, and convenient transportation at the lowest cost consistent therewith and with other national objectives, including the efficient utilization and conservation of the Nation's resources.

The Declaration identified the new Department's purpose:

> The Congress therefore finds that the establishment of a Department of Transportation is necessary in the public interest and to assure the coordinated, effective administration of the transportation programs of the Federal Government; to facilitate the development and improvement of coordinated transportation service, to be provided by private enterprise to the maximum extent feasible; to encourage cooperation of Federal, State, and local governments, carriers, labor, and other interested parties toward the achievement of national transportation objectives; to provide general leadership in the identification and solution of transportation problems; and to develop and recommend to the President and the Congress for approval national transportation policies and programs to accomplish these objectives with full and appropriate consideration of the needs of the public, users, carriers, industry, labor, and the national defense.

Finally, the Declaration stated that the national policy was to make special efforts "to preserve the natural beauty of the countryside and public park and recreation lands, wildlife and waterfowl refuges, and historic sites." This policy resulted in one of the Act's most influential provisions, Section 4(f), which read:

> After the effective date of this Act, the Secretary shall not approve any program or project which requires the use of any land from a public park, recreation area, wildlife and waterfowl refuge, or historic site unless (1) there is no feasible and prudent alternative to the use of such land, and (2) such program includes all possible planning to minimize harm to

> such park, recreational area, wildlife and waterfowl refuge, or historic site resulting from such use.

(For a brief history of Section 4(f), see http://www.fhwa.dot.gov/infrastructure/50section4f.cfm and http://environment.fhwa.dot.gov/4f/index.asp.)

To be the first Secretary of Transportation, President Johnson selected Boyd, who had headed the task force on creation of the Department. A 44-year old lawyer, Boyd had been general counsel of the Florida Turnpike Authority and chairman of the Florida Railroad and Public Utilities Commission before President Eisenhower appointed him to the Civil Aeronautics Board. Boyd became chairman in 1961 and was appointed Under Secretary of Commerce in 1965.

President and Mrs. Johnson watched on January 16, 1967, as Boyd took the oath of office in the East Room of the White House. The President explained that Boyd would "coordinate a national transportation policy for this great land of ours . . . and give the kind of results that the American people would like to point to with pride."

The U.S. Department of Transportation opened for business on April 1, 1967. On the National Mall, Secretary Boyd participated in opening ceremonies that were combined with the Smithsonian Institution's third annual Rite of Spring, titled a "Pageant of Transportation" for the occasion. According to an account in *The Washington Post*, "Everything seemed to be happening at once" on a sun-drenched day. As bands played, large crowds enjoyed viewing past, present, and future vehicles, including a llama, a 15-passenger horse-drawn omnibus (pulled by mules on this occasion) from 1880, antique automobiles dating to 1910, an air-cushion "Hydroskimmer," and a rocket-propelled man.

After a news conference during which Secretary Boyd introduced Department leaders, he pledged that the new Department would work to make transportation more efficient and more socially responsible. In a remark that seemed directed at the impacts of the Interstate System, he added, "We want an end to the noise, pollution, and general disfigurement transportation has unintentionally brought to our cities."

The opening of the new Department meant changes for BPR. One involved the name "Bureau of Public Roads." It had been the name of the agency during two periods spanning 39 years (July 1, 1918, to June 30, 1939, and July 1, 1949, to March 31, 1967) with the agency named the Public Roads Administration between them. On April 1, 1967, when the Federal Highway Administration (FHWA) began operations, it was organized into bureaus headed by Directors. The BPR was retained for one of them, along with the Bureau of Motor Carrier Safety (now the Federal Motor Carrier Safety Administration) and the National Highway Safety Bureau (now the National Highway Traffic Safety Administration). With the additions, the agency increased from about 4,800 employees at the end of 1966 to 5,360 employees a year later. (In a reorganization that took effect on August 10, 1970, the FHWA eliminated its bureau structure, replacing the Directors with Associate Administrators, and finally retiring the "Bureau of Public Roads.")
Perhaps the most surprising change was that the new Federal Highway Administrator would not be an engineer. After Whitton, whose entire career had involved road building, retired at the end of

1966, President Johnson nominated Lowell K. Bridwell to the post. He was the first head of the agency, dating to 1893, who was not, in some way, a road builder. Bridwell had been a journalist, most recently as the top writer on highways for the Washington Bureau of Scripps-Howard Newspapers, a post he had assumed in 1958. He had joined the Commerce Department in April 1962 as assistant to Under Secretary for Transportation Clarence Martin, Jr., before being appointed Acting Deputy Federal Highway Administrator on January 20, 1964, a post he held until becoming Deputy Under Secretary of Commerce for Transportation (Operations) on July 2, 1964. He would take office as Federal Highway Administrator on March 23, 1967, and hold the position until the end of the Johnson Administration on January 20, 1969.

(Under Reorganization Plan 2, adopted July 1, 1968, President Johnson transferred administration of the mass transit programs from the Department of Housing and Urban Development to the new Department, establishing the Urban Mass Transportation Administration (UMTA) to carry out those functions. The Maritime Administration remained in the Commerce Department until 1981, when it moved to the Department of Transportation.)

The Fiscal Bomb

Pressure on the Highway Trust Fund was increasing. By 1965, BPR was reporting that the estimated cost of the Interstate System had increased to $46.8 billion (Federal share: $42 billion). The price tag would increase to $56.5 billion by 1968 (Federal share: $50.6 billion), increasing the highway industry's concern about any proposed diversion of Highway Trust Fund revenue from the main task.

President Lyndon B. Johnson would pose several threats. One was the threat that Highway Trust Fund revenues might be used for the President's highway beautification program and the Appalachian Regional Development Program. Highway interests supported both programs after ensuring that the programs would be funded out of the General Treasury.

The biggest threat came from an unexpected source: the Vietnam War. President Johnson was committed to continuing his Great Society initiatives, but the increasingly costly war was straining the Nation's resources, a fiscal conflict usually referred to as "Guns and Butter." With the economy growing and employment steady, inflation was a concern throughout 1966. In August, pollster Lou Harris called it "a crisis of major proportions," while the President's poll numbers included a 90-percent unfavorable rating on handling of the economy. [Woods, Randall B., *LBJ: Architect of American Ambition*, Free Press, 2006, p. 687-688]

Nevertheless, the President continued his Guns and Butter approach, while trying to trim government spending to limit its inflationary impact. He called on the Departments of Agriculture, Defense, and the Interior, as well as NASA, to trim their budgets. He threatened to veto pork barrel spending if Congress tried to trim the Great Society programs. As he explained in a letter to the House Committee on Ways and Means on January 19, 1966, he was faced with three choices: running a deficit for FY 1967 of $6.5 billion, increasing corporate, personal income, or other taxes, or restoring certain excise taxes and adopting graduated withholding of individual income taxes "to put the American people on a pay-as-you-go-basis without increasing the total tax bill due." He added:

> I made two decisions.
>
> First, we could raise revenue or borrow it. I chose to raise the money.
>
> Second, I chose to raise that money without any increases in personal and corporate income tax liabilities, but through changes that affect only the timing of tax payments and the temporary restoration of certain excise taxes on telephones and automobiles.

He was hoping that "our efforts for a peaceful resolution of the Vietnam situation" would be successful, but if not, he would not hesitate to ask for additional revenue. Those efforts, which he pledged to "continue night and day," were not successful. The squeeze on revenues continued through the year.

On November 23, 1966, the day before Thanksgiving, President Johnson dropped a bombshell on the highway community. With the cost of the war growing and inflation high, the President announced that to reduce Federal spending, he would cut back on the Federal-aid highway program by limiting State obligations to $3.3 billion instead of $4 billion. (An obligation is a legal commitment (or promise) to pay the States for the Federal share of a project's eligible costs. Because the program operates on a reimbursement basis–paying the State the Federal share of State expenditures – the obligation is important to the State as it begins incurring costs on a project.)

Engineering News-Record referred to the announcement as a "fiscal bomb" dropped on the highway community–which happened to be meeting in Wichita, Kansas, the following week for AASHO's annual meeting:

> At Wichita, some shellshocked state officials admitted they would have to go home and do a detailed analysis before they would know how hard they had been hit. Others knew immediately, particularly those that apparently were hurt the most.

The meeting went on as scheduled, with Secretary of Transportation-designate Alan S. Boyd telling AASHO that the action had been taken only after "a tremendous amount of soul searching." He added:

> There is no blinking at the fact [that the cutback] will create some hardships here and there, cause some dislocations and require planning revisions. But this is a response to a national need that responsible citizenship demands.

Officials scrambled to perceive how the cutback would affect their State, but the magazine indicated that calm descended:

> Behind the scenes, the word was "cool it." Responsible federal and state leaders seemed to agree there was no way to fight the action effectively, at least immediately. Said one, "We

> are looking farther ahead. We must ride this out. We got to accept it and not jeopardize the future of the program." ["Fund Cut Irks Highway Officials," *Engineering News-Record*, December 8, 1966.]

After the initial shock, highway interests had no intention of cooling it. Governors, State highway officials, highway contractors, and trade organizations flooded the White House and Members of Congress with protests. Representative Fallon, now Chairman of the House Committee on Public Works, said:

> [T]he cutback and freeze makes it impossible to maintain an orderly highway construction program. The failure to do so is not only economically shortsighted but puts us in the highly questionable position of acceding to an action that must spell death and injury to the thousands of people who will be involved in accidents.

Congress took up the cutback in a joint hearing on February 27, 1967, of the House and Senate Public Works Committees. Secretary Boyd, in an apparent attempt to mitigate the likely abuse he would receive during his testimony, announced the release of $175 million in obligation authority, with the balance to be released as economic conditions allowed. The President announced the decision at the same time, saying at a press conference:

> I suggested to the Secretary of Transportation over the weekend—and we have consulted the Governors—that we would release $175 million of the $1.1 billion in highway allocations, in authorizations, that had been temporarily withheld. This will permit them to do some planning, particularly in connection with safety, right of way, bids and things of that nature. It will equalize some of the hardships that have taken place.

During the hearing, Governor John Volpe of Massachusetts, who had built a successful construction company and served as the first Federal Highway Administrator (1956-1957), represented the National Governors Association. He said the Johnson Administration was "tampering with highway monies in a tangled, uncoordinated attempt at fiscal sanity." He could not, he said, accept the "logic that led to this action," which was "a direct violation of the intent of the Congressional action that established the highway trust program." He called for an immediate reversal, saying:

> For the administration to use gasoline monies for non-highway purposes is as illogical and improper as it would be to use social security funds for purposes other than caring for the aged. [Gallagher, Thomas C., "Gas Tax Stand Haunts Volpe," *Boston Herald*, March 15. 1967]

Two weeks later, on March 18, the President assured the Nation's Governors at an all-day White House Conference on Federalism that they would receive the full $4.4 billion in Fiscal Year 1968. During a briefing by Secretary Boyd, Governor Volpe spoke up, as recounted by the *Chicago Tribune*:

> During the briefing by Alan S. Boyd, the secretary of the new department of transportation, Gov. John Volpe of Massachusetts criticized the President's deferral of highway funds. He

> said the withholding of the funds ruined one of the main benefits of the highway program—long range planning.
>
> The President told Volpe that the states would get all their money "and you'll get more for your dollar than you would if you had it."
>
> He was referring to the inflationary effect on highway prices. The President in releasing 791 million dollars in frozen funds yesterday said the inflationary pressures on the economy have subsided.
>
> Johnson turned to Boyd and said, "You answer him now."
>
> The transportation secretary said that in addition to the 350 million dollars in frozen highway funds released yesterday, the regularly [sic] quarterly release of 750 million dollars would be made in April. On July 1, he said, federal highway-aid funds for the next year, totaling 4.4 billion, would be released. [Dombrowski, Louis, "Lyndon Promises Governors 4.4 Billions in Highway Aid," *Chicago Tribune*, March 18, 1967]

As author and critic A.Q. Mowbray put it:

> For several months, during the summer and early fall of 1967, all was serene on the highway front. The battle had been won, and, seemingly, the principle of the untouchableness of the Highway Trust Fund established. [Mowbray, A. Q., *Road to Ruin*, J. B. Lippincott Company, 1969, p. 25, footnote]

However, with the war continuing to absorb Federal revenue and inflation still not under control, the budget situation had not improved, as Professor Randall B. Woods explained in his biography of President Johnson:

> By 1967 LBJ had become convinced, very reluctantly, that he could not continue to have guns and butter without a tax increase. He knew how Americans hated taxes; he knew that "higher taxes and federal spending" were the issues that conservatives could always make political hay with, but the budget had soared to $126.7 billion for FY 1967 and was projected to reach $135 billion for FY 1968. The administration had estimated that around $12 billion would be needed for Vietnam; the figure turned out instead to be $21.9 billion. The Johnson budget called for only $1.9 billion more for Great Society programs—just $280 million over FY 1967 for the War on Poverty—but the president refused to abandon other programs he regarded as essential.

During his State of the Union Address on January 10, 1967, he had outlined the budget problem, then said:

> I recommend to the Congress a surcharge of 6 percent on both corporate and individual income taxes—to last for 2 years or for so long as the unusual expenditures associated with our efforts in Vietnam continue. I will promptly recommend an earlier termination date if a

> reduction in these expenditures permits it. This surcharge will raise revenues by some $4.5 billion in the first year.

Congress did not embrace the proposal. In fact, as Woods explained, the idea of a surtax "lay dead in the water" for 6 months:

> Members of the conservative coalition did not want to give the administration additional funds because they opposed most aspects of the Great Society program; liberals did not want to give the administration more money because they opposed the war in Vietnam and wanted to make LBJ choose between domestic programs and the conflict in Southeast Asia.

In June, President Johnson received "devastating news," namely that the cost of the war was increasing along with the cost of Medicare, Social Security, and other domestic programs. The budget deficit for FY 1968 was projected as high as $28 billion:

> Several days later, he presided over a cabinet meeting. "The country could not tolerate a deficit of from $25 to $30 billion," Johnson said. Either there would be new taxes or programs would be cut. Each cabinet officer, each agency head must cultivate every representative and senator they could gain access to. While they were applying a thick coat of butter to the solons, he would be "tailing em up."

The key was Representative Wilbur Mills (D-Ar.), Chairman of the Ways and Means Committee, where tax measures originated. In a White House meeting on July 26, Mills agreed to help draft a tax request message to Congress, but said he would not support it unless it was accompanied by dramatic cuts in domestic programs:

> On August 3, the president sent his message to congress, asking this time not for a 6 percent but for a 10 percent surcharge on personal and corporate income taxes. Congress's response was to threaten virtually every component of the Great Society program, from education to Medicare to Social Security to rent supplements to public broadcasting. All right, if they want cuts, LBJ responded, we'll give them cuts. He contemplated telling Congress that if it did not enact a tax increase, he would request the House and Senate to cut all appropriations by 10 percent. "Including defense," [Secretary of Defense Robert] McNamara interjected. "I'd stick it to Mills," he said, implying that he was leading a congressional charge that would not only undermine existing domestic programs but threaten the war in Vietnam. All the while, Johnson continued to lash his cabinet officers, telling them that if they did not lobby the hell out of Congress, he would sacrifice their budgets first. [Woods, p. 795-796]

The issue would reach the highway community on October 8, as Mowbray explained:

> Frustrated in his attempts to get a tax increase, furious at what he felt to be irresponsible yammering from Congress about spending cuts, Johnson countered with a right cross to the body, a blow that the men on Capitol Hill felt below the belt. They wanted spending cuts? All right, he would give them spending cuts. He proceeded to freeze funds for certain low-priority military construction projects and for the time-honored "pork barrel" construction

> involving rivers and harbors and flood control. Further, he instructed Transportation Secretary Boyd to send a telegram to each of the fifty governors warning that massive cuts might be necessary in federal-aid for highway construction. The telegram asked the governors to give their estimate of the economic effects on their states of a freeze in highway funds amounting to as much as $2.2 billion, or half the program for the year.

The money would not be diverted, but would simply be withheld in the Highway Trust Fund.

Secretary Boyd informed the Nation's Governors by telegram that:

> In view of recent congressional discussions on substantial reductions in federal expenditures, it may become necessary to impose ceilings on the federal-aid highway program in the immediate future.

He proposed quarterly ceilings, effective November 1, 1967, if the highway cuts were necessary.

Although "observers agreed that the move was an attempt to put pressure on Congress rather than a serious effort to cut spending," the Governors and highway interests were up in arms immediately. Governor Ronald Reagan of California (1967-1975) called the plan a "dishonest and a grave mistake on the part of the Administration, since under federal law, highways are built with gasoline tax funds placed in trust for highway purposes. They cannot legally be diverted or used as a tool for fiscal gimmicks." [Mowbray, p. 26]

Governor Spiro Agnew of Maryland told Boyd that the proposed highway program cuts would be "absolutely devastating" to his State and he "will use all of the influence in my office to prevent any cutback whatsoever" in the funds. [Associated Press, "Plan to Cut Highway Aid Irks States," *The Baltimore Sun*, October 10, 1967]

AASHO members, holding their 53rd annual meeting the following week, were incensed that their program was again being used to make a point in an unrelated dispute between the President and Congress. The organization adopted a resolution warning that any cutback would have a "great adverse effect upon the program and would not be in the public interest." The resolution called for an end to "the atmosphere of uncertainty that has engulfed the federal-aid highway program" and urged that it be allowed to proceed "at the maximum level possible." [Mowbray, p. 27-28]

Representative Fallon addressed AASHO on "the puzzle of the cutback":

> It is very hard for me to understand how we can consider a proposal to reduce the highway program by one-half, or even by 25 percent . . . . Last November, you will recall, the announcement of the cutback made prominent reference to the war in Vietnam and the importance of deferring domestic programs which might detract from our effectiveness there. There was also a reference to inflationary pressures in the economy which might be reduced by deferring some Federal spending programs . . . .

> Then, at last the Administration's position emerged. It became evident that the cutback was made (and here I quote the statement of the Federal Highway Administrator) "for the purpose of reducing inflationary pressures at a time when there was virtually full employment, when construction equipment purchase prices were at an all time high and rising, when the average number of contractors was decreasing, and finally, at a time when the construction price index for highway construction work had increased at an abnormal rate for three successive quarters."
>
> It was related, in other words, to an Administration finding that there has been abnormal inflation in the highway construction industry over a nine-month period. The relationship to the total economic picture and the military situation in Vietnam was quite indirect.

Regarding the October 8 telegram, he advised the State highway leaders that if they had not consulted with their Governor on the impact of a cutback, "you should do so at once."

Representative Kluczynski, who had succeeded Representative Fallon as Chairman of the Subcommittee on Roads, shared Fallon's puzzlement:

> We've been told this year's proposed ceiling is to meet the Congressional demands for economy, so that the federal deficit will be less. It makes great newspaper copy, but the plain fact is that cutting highway construction funds won't improve the federal deficit situation by a single dime.
>
> We are also told, as we were told last year, that this proposed ceiling is to combat inflation. I have some doubts about how effective it is likely to be on a short term basis, and I am sure that over the long haul, it would be pretty poor business . . . . It is also my personal opinion, for whatever it's worth, that these freezes, ceilings or whatever, are illegal. The law says quite clearly that the funds shall be made available to the States. It does not seem ambiguous or discretionary to me, and it never has. [*American Highways*, January 1968]

President Johnson was reportedly furious with Secretary Boyd for releasing the telegram to the press, resulting in an onslaught of criticism. [Mowbray, p. 26]

Moreover, the President's efforts to move Mills failed. By the time the 90th Congress adjourned in late November, Mills was still insisting on deeper cuts as the price for the tax increases.

As 1968 began, the States and highway interests appeared to have won the fight. The Department of Transportation released the usual quarter of Federal-aid highway funding for the first quarter of the year–$1.1 billion of the annual $4.4 billion. However, on January 22, Secretary Boyd cut the release by $600 million. It was, he explained, a "modest but essential move to combat inflationary trends in the economy." He said the Administration was concerned about inflation in construction activity and the "significant impact of Federal and state highway construction activities on these price levels." He expected the cut to be an "important" aid in "checking inflation." [United Press International, "U.S. Takes Ax to Roads Again," *Indianapolis Star*, January 23, 1968]

On April 24, Secretary Boyd reaffirmed the reduction, but modified the formula for distributing the cutback among the States. To address inequities in the original plan, he said that State highway agencies would be able to obligate funds at their previous level or the reduced level up to the point where nationally the cutback had been achieved. About half the States would be able to continue their programs at the higher level. [Associated Press, "Road Fund Formula Devised for States," *The New York Times*, April 25, 1968]

Highway backers feared that these moves were a harbinger of anti-highway moves during the year in which the regular 2-year Federal-aid highway bill would be developed. Pennsylvania's top highway official, Robert G. Bartlett, spoke for many highway officials when he called it "a black day for highway construction in Pennsylvania." He feared it was a step in a plan to divert Highway Trust Fund revenues to other purposes, a move he considered illegal. "Congress set up inviolate—and I underscore inviolate—rights where monies that go into the highway trust fund must be used only for highways." [Mowbray, p. 29]

The Administration and Congress were still wrestling over the President's desired income surtax. On May 15, Secretary Boyd warned that congressional demands for cutbacks could have a "drastic impact" on the highway program. If Congress insisted on $6 billion in cuts in return for the new tax, "We're not going to have the money to build roads, condemn property or for anything else." The highway program would continue at a lower level and highway user tax revenue would accumulate in the Highway Trust Fund, but appropriations approved by Congress each year would be cut. [Eisen, Jack, "Boyd Warns of Drastic Road Cuts," *The Washington Post*, May 16, 1968]

While the cutback was being debated, Congress was ready to take up the next 2-year reauthorization legislation. Secretary Boyd released the Administration's proposal. Which called for extension of the Interstate program for 2 years to 1974, along with an additional $8.340 billion for Interstate Construction. The proposal also called for the Federal Government to pay 75 percent of the cost of fringe parking areas associated with mass transit stations serving cities with populations over 50,000, as well as a change in the formula for compensating homeowners, farmers, and businesses for property purchased for highway construction.

Under the proposal, States would be able to engage in advance protective acquisition of property to prevent commercial development before construction could begin on a planned highway. In addition to fair market value, compensation would take into account the cost of moving or establishing a new business or farm. The proposal also called for a program to increase the capacity of existing roads (TOPICS – Traffic Operations Program to Increase Capacity and Safety). All would be funded through the Highway Trust Fund. [Woll, Harry D., "New Highway Programs Proposed," *Transport Topics*, May 27, 1968]

The President finally reached agreement with Congress, resulting in the long-sought legislation in late June. President Johnson signed the Revenue and Expenditure Control Act of 1968 on June 28. In remarks, he acknowledged that just 4 and a half years earlier, he had signed the biggest tax cut in the Nation's history during a time when the economy was dragging; now, after 88 months of sustained prosperity, he was signing legislation that would "return to the Treasury about half the tax cuts I signed into law in 1964 and 1965." He said:

> This marks the largest shift of the budget toward restraint in the past two decades. Now we can attack decisively—at the roots—the threats to our prosperity: accelerating inflation, soaring interest rates, deteriorating world trade performance. Now we can mobilize the defense of our dollar at home and abroad and fulfill our obligations to world monetary stability. Now we are assured that we can continue to rely on free markets, unfettered by damaging Government controls.

The tax bill was the "best insurance policy" to protect prosperity, far better "than the cruel and haphazard tax of rising prices and spiraling interest rates."

The price for this desired tax increase was the congressional demand that the President reduce Federal expenditures by $6 billion in FY 1969. His proposed budget "was lean and tight," but "I have accepted this decision of the Congress because the tax bill is so imperative to the economic health of the nation." He expected Congress to reduce the budget through the appropriations process by considerably less than $6 billion, he said, shifting the responsibility to him to make the cuts. He considered this "departure from the traditional appropriations process [to be] most unwise." He also objected to the provision rolling back Federal employment to the level of 2 years earlier. He would, he said, do his best to carry out these congressional mandates.

Despite this assurance, the President was going to rely on the nature of Congress, as described by Woods:

> . . . LBJ had to agree in principle to a $6 billion spending reduction for the coming fiscal year, but he intended not to take the initiative, suspecting that when it came down to it, Congress would not have the will to make specific program cuts. He was proved right. Congress was unable to cut even $4 billion in pending expenditures. Fiscal year 1969 ended with a $3.2 billion surplus and with most of the Great Society program intact. [Woods, p. 844]

The Federal-Aid Highway Act of 1968

At the same time, Congress was developing the new 2-year authorization for the Federal-aid highway program. The Senate approved its version of the bill in July. It continued the Interstate program at the usual $3.6 billion a year, and authorized $1.2 billion a year for the Federal-aid primary and secondary systems and $549.5 million for roads on Federal lands. It provided additional benefits for relocatees, affirmed protections in the Department of Transportation Act for parkland, public lands, and historic resources to be taken for highways, and gave the Secretary the authority to disapprove projects that do not conform to the "particular economic, social, environmental and other needs of the locality in which the project will be built."

While the Senate was completing work on its version, the House was debating its bill. On July 3, Representative William F. Ryan (D-NY), who had represented Manhattan's Upper West Side since winning election in 1960, offered an amendment on "Use of Certain Funds for Urban Mass Transportation Purposes." It would allow any Governor to use Federal-aid highway funds for urban mass transportation purposes. He explained:

> What it does is to allow the Governor of each State to decide how he wants to improve the transportation system within his own State. In those parts of a State where a Governor finds that additional highways are desirable, he will be free to build more highways. But under my amendment, in those areas where the Governor sees that the most efficient way to strengthen the highway system is to clear the existing arteries of most of the deluge of daily commuters, he would then be permitted to use funds under this act for mass transit.

Representative Fallon insisted on a point of order, noting that Representative Ryan had introduced the same amendment in 1966, but it had been ruled out of order because the bill then, as now, was about the authorization of highway user tax revenues that could not, by law, be used for mass transportation. Ryan acknowledged that he had introduced the amendment on August 11, 1966:

> At that time, it was ruled out of order on the ground that it related to mass transportation and not highways, and it was suggested by the chairman of the committee [the Chairman of the Committee of the Whole] that this issue should be raised when the mass transportation bill was before the House. So on August 16, 1966, I offered it as an amendment to the mass transit bill; and it was ruled out of order, on the ground that it related to highways and not to mass transportation.
>
> We cannot have it both ways. It must be in order in one place or another.

The Chairman, Representative Daniel D. Rostenkowski (D-IL), explained that he had ruled the amendment out of order in 1966 because an amendment on urban mass transportation was not germane. He followed his own precedent in this case and would not allow a vote on the measure. ["Amendment Offered by Mr. Ryan," *Congressional Digest-House*, July 3, 1968, p. 19926-19927]

The approved House bill continued authorizations for the primary and secondary systems at prior levels while adding funds for TOPICS. It authorized Interstate funds for the 4 years requested by the Secretary instead of the 2 years in the Senate bill. Both bills included the fringe parking and relocation provisions requested by the Secretary, although in different form, but the House bill virtually killed funding for the highway beautification program approved in 1965. Nan Robertson of *The New York Times* explained this cut:

> A high Government official called the mood of a substantial part of those 211 Representatives who voted against highway beautification funds one of "absolute revenge" against both President Johnson and his wife.

The desire for revenge stemmed from final passage of the Highway Beautification Act of 1965:

> The ire of certain House members, particularly Republicans, dates back to Oct. 7, 1965. It was the night of Mr. Johnson's "Salute to the 88th Congress" party at the White House—a party that the legislators, in tuxedo, on the hill, and their wives, in party finery in the galleries, were not able to get to until after midnight.

> What most House members believe and constantly hark back to—particularly Republicans—is that the President insisted they remain in session until the beauty bill was passed, instead of letting them take it up [the] next day.

The bitterness of that long night was a more important factor, Robertson reported, "than the powerful billboard lobby." [Robertson, Nan, "Conferees Agree on Highway Bill," *The New York Times*, July 25, 1968]

One of the House's more controversial provisions would add 3,000 miles to the 41,000-mile Interstate System to make adjustments to fill gaps in the System. The Committee on Public Works report explained:

> The Interstate System now stands at an authorized 41,000 miles. All of it has been designated and less than 15 miles remains for making sorely needed adjustments. There are obvious, and serious, gaps in the system which prevents its being the continuous, interconnected network the Congress and the Nation envisioned in 1956.

The report listed examples submitted by the States, such as 16 miles to complete the missing quadrant of the Ft. Worth circumferential; approximately 300 miles between Shreveport and New Orleans; 9 miles for the Crosstown Freeway in Lexington, Kentucky; and 300 miles to link Tampa and Miami. It continued:

> The committee believes it would be unwise to authorize extensive construction mileage additions to the Interstate System at this time, but it is convinced that the best interest of the Nation will be served if enough additional construction mileage is authorized to give the States and the Federal Highway Administration some reasonable leeway in programing these deficiencies. [*Federal-Aid Highway Act of 1968*, House Report No. 1584 on H.R. 17134, 90th Congress, 2d Session, June 25, 1968, p. 4]

The bill did not propose additional funding for the mileage. The States were to decide on the priority of their mileage.

The Senate did not include a comparable provision. While House and Senate conferees worked to reconcile the two bills, Secretary Boyd joined an unlikely coalition of Federal, State, city, and county agencies, including AASHO, in opposing the extension. Their statement explained:

> Any addition of mileage to the 41,000-mile interstate system at this time, without the opportunity for adequate planning or funding, could cause serious and extended harm to the nation's highway network.

They noted that the completion date for the Interstate System, originally the early 1970s, had already slipped 2 or 3 years. The extension would push it back further, "perhaps as much as eight to ten years" at a time when another provision of the bill called for a comprehensive study of the highway network as the basis for allocating future funds. ["Increased Road Plan Under Fire," *The Baltimore Sun*, July 21, 1968]

In conference, the House and Senate compromised by agreeing on a 1,500-mile addition. The Conference Report explained that when the System was laid out, "no provision was made for flexibility . . . to meet the tremendous changes that have taken place in population and development in many sections of the Nation." It continued:

> As a result, there are several cities of more 100,000 population that are not now on the Interstate System . . . . By the same token, virtually everyone recognizes that these serious missing segments must, in many instances, be built in the very near future if the system's ability to handle its traffic is to be maintained.

As in the House bill, the 1968 Act did not provide additional funding for the new mileage. The Conference Committee made clear that the Secretary was to designate "critical missing link" situations, but was not to substitute his judgment for that of the States as to which of all remaining designated mileage in a State would be built. "This flexibility is desperately needed now, on an interim basis, pending the time when the Congress determines what the long-range future highway program will be." [*Federal-Aid Highway Act of 1968*, Conference Report, House Report No. 1799, July 25, 1968, pages 29-31]

The 1968 Act also authorized the Secretary of Transportation to approve Interstate status for routes that meet Interstate standards and would be a logical addition or connection to the System, but were built without Interstate Construction funds. The new authority was codified as Section 139 of Title 23, United States Code (in 1998, the Transportation Equity Act for the 21^{st} Century shifted the provision as amended to Section 103(c)(4)(A)).

The legislation included the first mandatory payment program for those who must relocate because of a Federal-aid highway project. The goal was to provide every citizen with decent, safe, and sanitary housing and to reduce the inequities of a strict application of the fair market value concept to right-of-way acquisitions. These changes, plus additional changes in 1970 were influential as Congress developed the landmark Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (Uniform Act), the government-wide law. According to former Deputy Chief Counsel Edward V. A. Kussy of FHWA:

> The immediate precursor of the Uniform Act was the Federal-Aid Highway Act of 1968. The relevant relocation provisions of the 1968 Highway Act were so similar to those in the Uniform Act that any interpretation of the 1968 Highway Act would be equally applicable to the 1970 Uniform Act. [Kussy, Edward V. A., *Surface Transportation and Administrative Law: Growing Up Together in the 20^{th} Century*, Transportation Research Record 1527, Transportation Research Board, 1996, p. 10]

Congress also included a measure responding to the impoundment of authorized funds. Section 15 declared the sense of Congress that sums authorized to be appropriated for expenditure which have been apportioned among the States may not be impounded or withheld from obligation by the Executive Branch except when necessary to assure the integrity of the Highway Trust Fund. Further, revenue from the Highway Trust Fund could be used for the administrative expenses of FHWA, but no other agency may use the funds for administrative expenses unless specifically identified in a line-item appropriated or contracted for in accordance with the Economy Act (31 U.S.C. 686).

In addition, the legislation reduced highway beautification funding; established a right-of-way revolving fund for advance acquisition of property needed for future highway construction; approved TOPICS funding; authorized Federal-aid funds for a fringe parking demonstration project outside central business districts in cities of more than 50,000 population, with the facility to serve public transportation; and extended prevailing wage coverage under the Davis-Bacon Act to all Federal-aid projects, not just the Interstate System as the 1956 Act had required.

Congress completed work on the bill with Senate passage on July 29 and sent it to the White House for presidential approval.

At the "Texas White House" in Austin, President Johnson approved the measure on August 23. He considered vetoing the bill but on balance decided to sign it just before midnight on the final day for approval. (The bill would have become law if he had neither approved nor vetoed it.) [Dales, Jr., Edwin L., "President Signs Bill on Highways," *The New York Times*, August 25, 1968]

In a statement the next morning, he explained that he considered some provisions "unfortunate, ill-considered and a setback to the cause of conservation." He particularly objected to provisions that reduced highway beautification funds and attempted to force the District of Columbia to build its portion of the Interstate System. He concluded, however, that, "In many respects this is the most important highway authorization bill since the start of the Interstate program over a decade ago." The funds authorized by the bill would help complete the national network, but he was concerned that the 1,500-mile extension was adopted "without any serious study of the type of major highway program we will need after we complete the present system in 1974.

(The complex D.C. freeway issue played out legislatively through the Federal-Aid Highway Acts of 1968 and subsequent highway legislation and appropriations acts. These battles are covered in the separate article titled "The D.C. Freeway Revolt and the Coming of Metro," to be posted on this Web site.)

He also commented on the sense of Congress statement about impoundments:

> Earlier this year the Congress directed me to reduce expenditures by $6 billion and new obligations by $18 billion. This was not a responsibility I sought. While I appreciate the sense of Congress – as expressed in this bill – that Federal moneys not be withheld from the highway program, I must still exercise the responsibility to carry out these stringent economy measures. All government programs are being scrutinized with care. Highway projects will not be immune from this study, and funds will be provided or withheld in accordance with the need to comply with the Congressional mandate to cut $6 billion from the federal budget.

As a legal matter, a Sense of Congress statement in legislation is considered guidance, not enforceable law. The Administration was not bound to comply.

The long fight over the surtax and the congressional demand for budget cuts had not reduced the size of the bill. However, the Federal-Aid Highway Act of 1968 was another step in undermining the highway community's efforts to limit Highway Trust Fund revenues to construction of highways and bridges.

In response to FHWA's request for nominations for inclusion in the Interstate System, the States submitted applications totaling more than 10,000 miles. On December 13, 1968, Secretary Boyd announced designation of 1,472.5 miles to routes in 28 States at an estimated cost of $2.43 billion. The additions included I-27 in Texas (Amarillo to Lubbock), extension of I-75 from St. Petersburg, Florida, to Miami; I-43 from Milwaukee to Green Bay, Wisconsin; and I-88 from Binghamton to Schenectady, New York.

John O. Morton, Commissioner of the New Hampshire Department of Public Works and the president of AASHO, commented on the bill during the group's annual meeting in December:

> [R]ecognition of our past accomplishments and the favor in which the highway program is held by the American people, are reflected in the Federal-Aid Highway Act of 1968. Highway officials applauded the passage of this 1968 act and considered it a progressive and outstanding piece of highway legislation. The act preserved the integrity of the highway trust fund. It recognized the fallacy and waste created by ill-conceived cutbacks and took a positive position in opposition to future cutbacks.

During the same AASHO annual meeting, FHWA's Francis C. "Frank" Turner, Director of Public Roads, commented on attempts to divert Highway Trust Fund revenues. He addressed AASHO's Subcommittee on Highway Finance on December 4. His topic: "The Highway Trust Fund." Turner had been BPR's representative to Congress in 1955-1956 as it wrestled with how to fund construction of the Interstate System. He discussed its origins and operations. "In summary," he said, "there are many advantages to a Trust Fund operation, and there are some obvious concerns." The advantages were:

> On the plus side, programs may be authorized for a period of years in the future, as in the case of the Interstate program, with assurance that revenues will be available to liquidate the obligations incurred. With contract authority such as we have for the highway program, it is possible to incur obligations in advance of revenue collections needed to liquidate the obligations, and we continually operate with unliquidated obligations totaling about $6 billion, with assurance that funds will be available in the Highway Trust Fund to reimburse the States when the work is done.

The trust fund concept raised some concerns:

> On the other hand, it is necessary that the program be carefully controlled to assure that obligations do not exceed amounts that can be liquidated from the Trust Fund on a year by year basis. And it must be recognized that the program is still subject to such controls as may be necessary by reason of inflationary pressures, expenditure reductions, appropriation limitations and other factors, notwithstanding the availability of revenues in the Trust Fund.

These were practical concerns about operation of the program. Turner was concerned about another issue as well:

> In some quarters there is serious intention to raid the Highway Trust Fund for the benefit of other modes of transportation, on the theory that it should be converted into a Transportation Trust Fund and its proceeds made available to city mayors and officials for mass transit purposes. This is advanced as being necessary in order to give voice to local desires about how the transportation problem shall be resolved in each local community. Supposedly, this would permit a city governing board to decide to use their highway funds either for street improvements or for a subway. This is generally accompanied by the claim that a subway will not disrupt the community with dislocations of people or businesses, and that it will automatically take all of the traffic load off the city streets. Such statements are close to misrepresentations, even if based on nothing more than misunderstanding of what rail mass transit can do in solving the traffic load question over the entire metropolitan area.

He disputed the claim that "is bandied about that one track of rail mass transit can—note the word can—carry as much as 20 lanes of freeway." One lane of freeway, he said, "can do the same and more." He added that "at no point in the world has the theoretical capacity which they claim for rails been actually reached; about the highest capacity on record being in the order of 25,000 to 30,000 persons actually carried and this is a rate reached over only a short period time—5 to 10 minutes, rather than a full hour—and over a very short section of trackage." In short, he said:

> So the proposal for diversion of the Highway Trust Fund to "transportation" purposes, meaning rail in most cases, would not materially benefit the overall transportation process, but would in so doing rob the Highway Trust Fund of monies badly needed for more beneficial types of improvements.

Something more basic was on his mind:

> Aside from the less benefits of such a diversion, it is in my opinion just plain immoral, because the Highway Trust Fund was set up, as the word implies, to provide funds in trust for a stated and agreed-upon purpose. I do not believe in breaking faith with the American people who through their elected representatives in the Congress pledged that taxes levied in a certain way would be used only in the manner agreed upon. If funding is to be given to these other transportation purposes, then, they should go to the Congress and the people and make the needed agreement, just as did the highway people.
>
> There are likewise proposals regularly made to divert some of the proceeds of the Fund to a variety of other purposes, some not even related to highways or transportation. There is strong feeling in some government quarters against any earmarking of tax revenues, because it prevents "fluidity" of management of income; in other words, diversion to another purpose chosen by fiscal managers.
>
> We cannot operate a program of this magnitude, with its long planning and lead times, with its numerous commitments which must be built up over a long time in advance of actual

> construction without the certainty of the Trust Fund and the contractural [sic] authority provision of the highway program legislation. We must be alert to prevent actions to do away with these vital features.

In these remarks, he was speaking not only for himself and his agency, but for many in the highway community.

Despite the sense of Congress provision in the 1968 Act, Secretary Boyd announced another freeze on September 9, this time of $200 million in FY 1969, in line with the cuts required by the Revenue and Expenditure Control Act of 1968. He sent telegrams or made telephone calls advising the State highway departments not to advertise Federal-aid projects until December 1. After that date, he said, projects would be approved at an accelerated rate that would allow most of the postponed projects to be approved by July 1969. The postponement "is the most reasonable course available to the government to achieve the required reduction of $200 million in federal aid highway spending." [Flor, Lee, "U.S. Fund Freeze Hits Area Highway projects," *The Washington Star*, September 10, 1968]

Changing of the Guard

On November 5, 1968, former Vice President Nixon defeated Vice President Hubert H. Humphrey to become the Nation's 37th President. (Senator Muskie had been Vice President Humphrey's running mate.) During his first months in office, the new President visited government agencies to encourage employees. He addressed employees of the Department of Transportation on February 11, 1969, in the auditorium of the Federal Aviation Administration's (FAA) headquarters on Independence Avenue. He assured employees of the importance of their work:

> I think speaking from my vantage point, the vantage point of one who sees the problems of the people as a whole, I can very properly bring home to you the immense interest that the people of this country generally have in what you are doing . . . . I can assure you from my own experience, if there is one subject that people across this country—regardless of what station in life they come from—one subject they are interested in, it is transportation and all of its aspects.

For the most part, his remarks were generic in praising "what are called career civil servants of the Federal Government" and indicating that without their support, the Department's leadership cannot succeed "no matter how imaginative they are, how creative they are, how bold they are in their thinking, however many ideas they get." What was needed was "a new sense of not only dedication to our jobs," but an understanding that every single person in the Department was contributing to the "better running of this Department, but also to a better Nation for all of us." He said:

> I think if there is some way we could get across to all of the people in Government that however boring their job may seem to be, the writing of letters, for example, and getting out forms or running the mimeograph machine or I guess now you do it through a duplicating machine, or whatever the case might be, that all of this matters.

In truth, as Professor Tom Lewis explained, President Nixon was not concerned about the U.S. . "No matter who was in charge, so the new president believed, departments like Housing and Urban Development, Commerce, and Transportation would just rumble on as they had in the past."

Having passed over Governor Volpe for Vice President, President-elect Nixon had one of his aides, future Attorney General John N. Mitchell call and offer Volpe the job of Postmaster General. He politely refused. Mitchell called back a few days later and asked Volpe to be the new Secretary of Transportation. "You're a manager," Mitchell said. "That's what the president thinks we need." After talking with his wife Jennie and several friends, Volpe accepted.

Volpe met with the President-elect in California in late November. Volpe said, "I hope you realize that I'm not a 'yes' man, that I like to think things out, and if I feel that you or other people on your staff come up with an idea I disagree with, that for your interests and the best interests of the nation, I will tell you so." Nixon replied, "That's one of the reasons that I want you. Because I know you're *not* a 'yes' man, and I'll always get your best advice." [Kilgore, Kathleen, *John Volpe: The Life of an Immigrant's Son*, Yankee Books, 1987, p. 172-173]

Lewis pointed out that the offer came because Nixon "owed John Volpe a sop":

> When he had thought it useful during the primary campaign, he dropped the governor's name as a possible running mate. It had been a fiction, of course. Nixon wanted a vice presidential candidate who would be better able to appeal to the South, a tough and unpleasant scrapper, who would act as Nixon himself had when he served as vice president, so he passed over Volpe in favor of Spiro Agnew, governor of Maryland. Making Volpe Secretary of Transportation would assuage his feelings as well as add an Italian-American to the cabinet. [Lewis, Tom, *Divided Highways: Building the Interstate Highways, Transforming American Life*, Viking, 1997, p. 206-207

Volpe's life has often been compared to a Horatio Alger rags-to-riches story. He was born in Wakefield, Massachusetts, in 1908, the son of Italian immigrants. Beginning in 1933 with an initial capital of $500 ($300 from cashing in an insurance policy and $200 borrowed), he built the multi-million dollar John A. Volpe Construction Company, with offices in Massachusetts, Washington, and Rome. It was involved in heavy construction in New England, Florida, and Washington (including the privately owned Nassif Building at 400 7th Street, SW., in Washington, D.C., that housed the U.S. Department of Transportation from the late 1960's until June 2007).

He was widely known and respected within the highway community. In 1953, Massachusetts Governor Christian A. Herter appointed Volpe to serve as Commissioner of Public Works. In October 1956, Volpe resigned to return to private life but delayed doing so to serve as interim Federal Highway Administrator at the request of President Eisenhower while his permanent choice, Bertram D. Tallamy, disengaged from his lead role on the New York State Thruway and secured Senate confirmation. The President did not want any delay in getting his pet program, the Interstate System, underway.

On October 22, 1956, Volpe became the first Federal Highway Administrator. President Eisenhower, who attended the White House ceremony, said he wanted to make certain that the highway program got off to a "flying start." He held the Bible while Frank K. Sanderson, White House Administrative Officer, administered the oath of office to Volpe, the only Administrator who took the oath of office in the presence of a President. Immediately after the oath, the President shook Volpe's hand and said, "You're now part of the family here." Volpe would serve until Tallamy took office in February 1957.

Volpe returned to his construction company and served as president of The Associated General Contractors of America (AGC) in 1960. He also won an unprecedented four elections for Governor of Massachusetts (1961-1963, 1965-1969).

Officials of AASHO had recommended Volpe for the post as Secretary based on his experience with road building as Public Works Commissioner, Federal Highway Administrator, and Governor. What the highway community did not realize is that Volpe "understood that the country could not depend on a single form of transportation, that there would have to be highways, rail lines, trolleys, and subways in cities, and airplanes for long distances." [Lewis, p. 217] As a result, Volpe would surprise the highway community.

Secretary Volpe would have to address issues across the full spectrum of transportation, but for the highway community, the big issue was his stand on the Federal-aid highway program, and especially diversion of funds for transit. On December 26, 1968, he held his first press conference as Secretary-designate, but as usual with nominees before confirmation, was vague on many subjects. Regarding transit, his opening statement indicated "We have got to do a great deal more about . . . bringing about a balanced, coordinated transportation system." He wanted to bring together State, county, and city officials to resolve their own local problem. Then he smiled and added, "I am not saying there might not be a need for more money." [Eisen, Jack, "Volpe's Transit Pledge is Vague as to Money," *The Washington Post*, December 27, 1969]

On January 15, 1969, the Senate Committee on Commerce held a confirmation hearing for Secretary-designate Volpe. He was asked, of course, about his life and experience. Senator Norris Cotton (R-NH) asked about reports that Volpe's company had helped build the Massachusetts Turnpike. Volpe replied, "My firm has not built one single mile of highway. We have not even engaged in highway construction." [*Nominations-1969*, Hearing before the Committee on Commerce, United States Senate, Serial 91-2, January 15, 1969, p. 29]

Senator Philip A. Hart (D-Mi.) asked if "based on the bitter experience of recent years," whether Volpe would "attempt to balance and include all the factors affecting the area of any proposed construction that merely the traditional bookkeeping judgment alone is not in the best long term interest of any of us?" As an example he cited minority groups who regard the Interstate System "as an enemy, because they do not generally run the highway through my house or yours . . . ." Volpe discussed how as Commissioner of Public Works he had reached out to communities in planning highways. He added that, "I can certainly assure you, Senator, that I will do everything within my power to be certain that we do take all aspects into consideration—esthetic, environmental, and human factors as well." [*Nominations-1969,* p. 33]

Senator John O. Pastore (D-RI) also questioned the Secretary-designate about highway controversies. Governor Volpe agreed to reply in writing, which he did on February 19 after taking office as Secretary. In response, the Secretary supported locating highways in accord with Federal statutes that "call for safe, efficient roadways so located and designed as to be of positive benefit to the other goals of the affected communities." Other factors considered included "preservation of historic values and natural beauty." He strongly supported the statutory changes affecting those displaced by highway construction.

As for the highway controversies in Boston, Secretary Volpe assured the committee that he would not be influenced by his earlier statements. He said that his successor, former Lt. Governor Governor Francis W. "Frank" Sargent had "asked me to withhold any action on the Inner Belt about Boston, I-695, until he has examined the situation. I have assured him that I would do so because of the delicacy of the relationships between the state and the affected communities in this matter."

Especially in the case of urban transportation, Secretary Volpe explained, his experience had convinced him that "each of the methods of transportation has a proper role to play in meeting the requirements for transportation in a metropolitan area." He had used the term "balanced," by which he meant "that the transportation planning should seek to utilize the particular capabilities of each mode. 'Balanced' means the modes work together as a system in proper relationship to the area it serves." He expected to see greater use of bus and rail transit systems as part of that balance. [*Nominations-1969*, p. 36-37]

In response to a question from Senator William B. Spong, Jr. (D-Va.), Governor Volpe added:

> I am one of those who believes that if we are going to resolve our problems and woes in urban areas, we can neither depend entirely on highways nor depend on rapid transit . . . . It has been shown that you can build 12-lane highways and still have congestion. So I am a firm believer in a balanced transportation system."

Senator Russell B. Long (D-La.) asked how far behind schedule the Interstate System had slipped. (He had been the only Senator who voted "no" on final passage of the Federal-Aid Highway Act of 1956, primarily because oil interests in Louisiana opposed the gas tax increase.) Volpe thought the System was only 2 or 3 years behind and would be completed in 1974, possibly 1975. [*Nominations-1969*, p. 41]

Senator Long pointed out the need to modernize the Federal-aid primary system as well as the Interstate System. Volpe agreed:

> I think there is no question that we have to think in terms of both the primary system as well as our problems in the rural areas . . . . My thinking would be that we ought to be starting to develop the program that we will follow after the completion of the Interstate System without waiting for that to happen and really do some long-range planning now for the future in both the primary highways as well as the rural highways. [*Nominations-1969*, p. 43]

The committee had invited Senator Jennings Randolph (D-WV), chairman of the Committee on Public Works, to participate in the hearing. He asked about the impoundments and pointed out the sense of Congress provision in the Federal-Aid Highway Act of 1968. He wanted to know if Governor Volpe approved of the action of Congress or would recommend to the President that he continue to impound funds from the Highway Trust Fund. Volpe stated that “I would never try to trespass the will of the Congress and I certainly would recommend very highly to the President that these funds be utilized as the Congress has specified and as the trust fund specifies. [*Nominations-1969*, p. 55]

On January 17, 1969, Governor Volpe left the State House for the last time and flew to Washington. According to his biographer, Volpe went straight to Walter Reed Army Medical Center to see former President Eisenhower:

> Volpe had planned a visit in November or December, but the former president had had a setback and was unable to see him. This time the nurse allowed Volpe only twenty minutes, but as he began to tell Eisenhower about his plans for DOT, the president sent the nurse away. Volpe found his host thin and wasted, but his mind was unimpaired. Eisenhower told him that when he was president, he had wanted to do something about transportation from cities to airports so that planes could land farther from urban centers, perhaps including a helicopter service or a rapid transit line with baggage capacity. At last, Mamie Eisenhower came in and advised her husband to get some rest. They parted, and Volpe never saw him again. [Kilgore, p. 175-176]

(President Eisenhower passed away on March 28, 1969. In August 1970, Secretary Volpe proposed to honor his former leader by submitting a bill to Congress to designate the “Dwight D. Eisenhower Highway.” It would be signed along I-70 from Washington to Denver; I-25 from Denver to Cheyenne, Wyoming; and I-80 from Cheyenne to San Francisco. (At the time, I-70S was designated into Washington; the portion that was finally built between Frederick, Maryland, and the Capital Beltway is now I-270.) The highway would loosely follow the path of the 1919 U.S. Army’s first transcontinental motor convoy, which had proved influential on the future President.

(Secretary Volpe submitted a bill to Congress on May 10, 1971, embodying the proposal. He said:

> Fifteen years ago President Eisenhower signed the Federal-Aid Highway Act of 1956 creating the National System of Interstate and Defense Highways. In recognition of his outstanding service to his country and the world, and of his having launched the program for the Interstate Highway System, we felt that it is particularly fitting and appropriate to honor the late President by designating certain routes of the Interstate System as a memorial to him.)

Volpe was confirmed by the Senate and was sworn in, along with other Cabinet officers, on January 22, 1969, just 2 days after President Nixon’s Inauguration. Chief Justice Earl Warren administered the oath of office.

In moving to Washington, Secretary and Mrs. Volpe considered a three-bedroom apartment in Rosslyn, Virginia, and had consulted an interior decorator. Then, as *The Washington Post* explained, "After crossing the traffic choked Virginia bridges several days at rush hour, however, Volpe changed his mind. He and his wife decided to settle closer to the official, in the unofficial Nixon enclave of Watergate east." [Oberdorfer, Don, and Eisen, Jack, "D.C. Gets Volpe Pledge on Chronic Road Ills," *The Washington Post*, March 9, 1969] His new apartment was a short drive from his office in the southwest quadrant of the city. Like all Cabinet Secretaries in that era, he had a limousine and driver.

In an interview with *Highway User* magazine, the new Secretary supported the Interstate System:

> As to the chief good and bad points of the highway program, I don't believe there are really any "bad" points, but there are areas which cause continuing concern. One is rising costs; the other, and more important, is the tragic annual toll of traffic deaths and injuries. On the positive side, we can point to these undisputed "good" points of the highway program: improved transport, safer roads, greater travel comfort, decreased travel time and cost, unlimited mobility on a reasonably good road, and so on.

As for cutbacks by the previous Administration, he said that promising no further cutbacks would be unrealistic. "The state of the economy sometimes dictates the necessity, or desirability, of curtailing Federal expenditures, regardless of the sources from which revenues are derived or the specific purposes for which revenues are collected."

The magazine also asked the new Secretary about the integrity of the Highway Trust Fund, namely whether funds collected from highway users should be spent exclusively for highways and related purposes. He replied:

> I believe that the integrity of the Highway Trust Fund must be preserved without question. This was the intent of the Congress and the Chief Executive in framing the Federal-aid highway legislation in 1956 and subsequent acts. In my opinion, to divert highway user tax revenues to purposes other than the provision of highways would abrogate a long-standing moral commitment, as well as a statutory provision. The Trust Fund financing arrangement has been one of the essential ingredients in the present successes of the highway program and under no presently foreseeable circumstances should it be eliminated or diluted. ["Secretary Volpe Tells Where He Stands," *Highway User*, February 1969, p. 4-5]

One of Volpe's and the Administration's concerns was urban unrest. President-elect Nixon had appointed a transition team to prepare a report on transportation. The report praised the mobility offered by highways, but contended that "improvements in personal transportation for a majority of individuals have intensified the problems of the large numbers of Americans without personal transportation." The conclusion was that "public mass transportation must be guaranteed." The report also decried the "powerful consequences" of the Interstate System in air, noise, and water pollution and recommended White House action that as, Mark Rose observed, "amounted to supplanting the leadership of engineers with the leadership of politicians."

In recognition of these concerns, Secretary Volpe created the post of Assistant Secretary for Urban Systems and the Environment, occupied by former Seattle Mayor James D. Braman. White House advisor John Ehrlichman, a real estate attorney who had represented anti-highway groups in Seattle, had recommended Braman after observing his political acumen. Volpe explained that the idea behind the new position was "to anticipate some of the troublesome areas before they reach that point of polarization within a community at which any rational solution is precluded." [Rose, p. 108-109, Kilgore, p. 177]]

Based on Braman's experience in Seattle, one of his highest priorities was to increase Federal funding for mass transit programs throughout the country. As he recalled after leaving office on October 1, 1970, "When we first arrived, they said we were just pursuing a will of the wisp—that it was totally impossible and that the highway lobby would knock us down." He added:

> We've got to realize that there are values now that we can't measure in yards of earth excavated, or any other measures that are used on the old cost-benefit analysis. When they're planning things today, they've got to throw out the old yardstick. They've got to put in new values, social values. [Loken, Marty, "Braman Tells of Battling Roadbuilders," *The Seattle Times*, November 20, 1970]

One of Secretary Volpe's early presentations was to the National Governors' Conference at the Washington Hilton Hotel on February 27, 1969. As chairman of the conference in 1968, he said he was "delighted to be with you" as Secretary of Transportation and "tremendously enthusiastic" about his new post. At the Department of Transportation, he said, "Our basic objectives include economic efficiency in transportation–the best use of environmental resources–a wide-ranging, all-inclusive safety program–ancillary support of other national interests."

As for highways, he said:

> I have been asked in several recent interviews whether I'm a "Highway Man" or a "Rapid Transit Man." The answer, of course, is that as of last month, I am a "Transportation man." I have said before, and I say again, that highways will not do the whole job. I'm a former Commissioner of Public Works, I'm a former Federal Highway Administrator, and I've cut plenty of ribbons to open new stretches of pavement . . . but I'll say it again, "Highways will not do the whole job." While we cannot neglect our great highway system – either from an expansion or a maintenance point of view – we must combine that system with rail, air and rapid transit modes. And we must bring to these other modes the same creative foresight we gave the Federal Highway Program back in 1957 [sic]. We need the funding to develop these other modes of transportation – and that is in the works. I have told the President that the Department of Transportation <u>will</u> come up with ideas and proposals to bring about the funding and the creation of a true national system.
>
> We need the knowledge, the expertise, and – in a sense – the <u>audacity</u> to put our crew of research and development experts to work to come up with fresh ideas backed with solid enthusiasm.

> We are going to stop assuming that what was good for the nation forty years ago in transportation is good enough today.
>
> We are pledged to move this nation with efficiency and safety. We will do this job with great spirit and dedication . . . .

His "greatest concern," he said, was to "avoid the on-again, off-again policies of past years . . . and that we experience no roadblocks in our efforts to construct a coordinated <u>highway</u> network within our proposed coordinated transportation <u>system</u>." [Emphasis in original text]

Volpe's choice for Federal Highway Administrator was universally applauded within the highway community. Francis C. "Frank" Turner, a native of Dallas, Texas, had joined the BPR as a Junior Highway Engineer in 1929 immediately after graduating from Texas Agricultural and Mechanical College (now Texas A&M). His first assignment was to collect time and motion studies to find ways of reducing highway construction costs, a typical assignment for trainees. From 1933 to 1940, he was an area engineer in BPR's office in Little Rock, Arkansas, responsible for Federal-aid projects in a portion of the State. While in Little Rock, he wrote his graduate thesis on how the maintenance of highways was affected by the type and physical characteristics of base and subgrade soil.

His experience proved invaluable when he was assigned in 1943 to expedite completion of the Alaska Highway, then being built through northwest Canada as a World War II effort to provide a land link from the States to Alaska. In 1942, the Public Roads Administration and the U.S. Army Corps of Engineers had opened a pioneer military trail through the wilderness. Now, in 1943, the Corps was gone and the PRA's job was to build a permanent highway on sound location to replace the pioneer trail. After helping complete the permanent highway that same year, Turner worked with Canadian and province officials to organize their forces for the maintenance activities they would be responsible for after the war. In 1946, Turner was the last American to leave the completed Alaska Highway project.

If the Alaska Highway had been a physical challenge, Turner's next assignment was a personnel nightmare. He was placed in charge of a program to restore the war-damaged roads and bridges of the Philippines at a time when the engineers he needed were just being discharged from the military and had little interest in service outside the United States. Nevertheless, he pulled together sufficient staff to launch the program, all the while training Philippines citizens to take over the work.

In 1950, Turner returned to Washington, where he became an assistant to Commissioner of Public Roads MacDonald. After the Eisenhower Administration fired MacDonald in March 1953, Turner served in a similar capacity with Commissioner Francis V. du Pont. From this post, Turner was a logical choice to work with the Clay Committee to develop a financing plan for President Eisenhower's proposed highway program. General Clay, an engineer who had served in the U.S. Army Corps of Engineers and was presently chairman of the board of the Continental Can Company, had no experience building roads, and neither did the commissioners he selected; Turner filled this gap.

During congressional consideration of the failed Federal-Aid Highway Act in 1955 and the successful 1956 Act, Turner was the liaison between BPR and the House and Senate public works committees. He provided the highway data the committees needed to develop the legislation and secure its approval in June 1956. From 1957 to 1969, Turner remained with BPR, serving as Deputy Commissioner, Chief Engineer, and then Director of Public Roads. In these positions, he played a major role in helping to resolve many project disputes and in keeping the Interstate System moving forward. He also worked closely with Volpe during his short tenure as Administrator.

Secretary Volpe announced Turner's nomination as Federal Highway Administrator on February 24, 1969. During Turner's confirmation hearing before the Senate Committee on Public Works on March 11, Senator Randolph asked about proposals to establish a trust fund for mass transit. Turner replied that those in the highway field had thought about ways of financing mass transportation for two reasons:

> A defensive one, first, because there are many proposals by mass transportation interests to transfer some of the needed highway moneys over to this other purpose, and, of course, because of our great need for those same funds, we must resist that kind of a transfer action.
>
> But we are also interested in it from the overall transportation standpoint, recognizing that a highway transportation mode by itself cannot supply the total needs for transportation in many of our urban areas. We must supplement it with other modes.

In most cases, mass transit was best accomplished by buses, although "in a few of our larger cities, we must go beyond that and possibly get into the fixed-rail type of facility."

Highway proponents had been fortunate "in finding a very satisfactory funding device by the highway trust fund," and such a mechanism for mass transit might be appropriate, but excise taxes on transit users would not, at present, produce "sufficient funds to finance the size of the program that is being thought of." He added:

> It may turn out, however, as a result of careful review of these transportation studies, we find out that we don't need as much investment in some of our fixed-rail type facilities as we have been thinking of up to this point, and if not, then the highway system that we would be building with the present trust fund, in and by itself, supplemented by a bus operation, might take care of a great share of this mass transportation need.

Asked to comment on news reports that Secretary Volpe was considering a Mass Transit Trust Fund, Turner replied:

> I participated in some of the discussions that led up to that proposal. It is just that, a proposal, and nothing else, at this point.
>
> Details have not been worked out, and I don't know that they can be completely worked out in a comparable way to the highway trust fund, but the advantages of the highway trust fund financing the highway program are so great that certainly it could be a good example for any

> other similar type of financing, or some other equally acceptable method of financing the mass transportation programs in our urban areas.

Aside from the continuing need for road building, Turner said diversion would violate a "compact" between Congress and the people of the United States that should not be broken. He admitted that critics had sometimes called him a "tool, as a member of the highway lobby, usually in a rather derogatory frame of reference." He continued:

> If there is a highway lobby in this country, and I think there is, it is not the highway lobby that is usually being referred to in those remarks.
>
> I think the highway lobby in this country is 205 million people. I believe it is a fairly powerful lobby, and I believe it a lobby that you and I should be responsive to.
>
> I believe that lobby is telling us they want an improved highway program. They want us to build not only more roads but to build better roads and make better utilization of the roads we do build.

[*Nomination of Francis C. Turner to be Federal Highway Administrator*, Committee on Public Works, United States Senate, Serial No. 91-3, March 11, 1969, p. 9-12, 23]

Turner took the oath of office on March 19, becoming the only agency employee to rise from trainee to Federal Highway Administrator. In addition to Secretary Volpe, the ceremony was observed by congressional leaders, including Chairman Fallon and Chairman Kluczynski of the House Committee on Public Works and Chairman Randolph of the Senate Committee on Public Works.

According to Kilgore, Secretary Boyd had offered his successor two pieces of advice: "Get out of Washington and see what is going on in the rest of the country, and don't get involved in the Washington, D.C. highway controversy." She continued:

> Volpe followed his first piece of advice. During the first few months of his administration, there was no early warning system in place to give notice that a highway project would encounter local opposition from neighborhood activists or environmentalists . . . . Several of the projects [Turner and his pro-highway staff] gave Volpe looked good on the map but proved disastrous in the field. During his first two months in office, Volpe approved projects based on the reports he was given. From his first day in office, he continued his practice of reading everything he signed and insisting on forty-eight hours' notice, no matter how tight the deadline. Soon he discovered, however, that the paperwork sometimes ignored or glossed over serious political problems . . . .

When Secretary Volpe and the Department moved to its new headquarters on 7th Street, SW., he soon fell into a routine:

> At 7 a.m., he would arrive at the DOT gym and go through his regular exercises, finishing off with a whirlpool bath. Then, as he had for sixteen years, he attended Mass, usually the 8 a.m. service at St. Dominic's just behind the DOT offices. After hearing about Volpe's physical fitness routine, Nixon joked at a press conference that Volpe was exercising with the space team and "might be one of our next astronauts." The new DOT building featured a gym with a weight room and a tiny wooden track on the roof. From the windows on the opposite side of the building, DOT employees could watch their boss patiently jogging his laps in the humid heat of a Washington summer or bundled in a sweatsuit in January. Employees began to use the new facility, too, while a few high-ranking officials even copied his hot tea and graham cracker snacks, hoping to get some of the same benefits he seemed to derive from his regimen. At home, the Volpes lived quietly, avoiding the Washington party circuit and accepting few invitations except those from old friends. [Kilgore, p. 179-180]

Urban Transit Challenges

As for former Secretary Boyd's second piece of advice, that proved impossible. The urban freeway issue in the District of Columbia and similar issues around the country became a theme that ran through Volpe's entire term of office.

During his first year in office, Secretary Volpe focused on transit. He recognized that improved transit was necessary for the car to operate more smoothly on congested city streets. However, as transit historian Smerk has pointed out, "An observer in early 1969 would have been accurate in stating that mass transit was a really 'safe' issue only for a senator from a state with one or more major urban centers or for a representative from a congressional district in a large urban area." Since its inception only a few years earlier, the transit program benefitted from traditional congressional practices:

> Log-rolling had been effective in permitting senators and representatives from transit constituencies to gain support from colleagues from electorates where transit seemed unimportant, but in the best back-scratching practice of Congress, a senator from a rural, agricultural state would back the transit program in return for support from a senator from an urban state for an agriculture measure. What was apparently lacking to boost transit was grass roots support; the federal mass transit program was seen by many as a program beneficial almost exclusively to large cities. Non-urban legislators would simply not give overwhelming support to transit legislation and the money it required unless the matter was one that promised broad, national benefits.

The urban transit challenge was worsened by the transformation of transit from a private to a public enterprise:

> Counteracting the image of mass transit as primarily a big-city concern was the slow but steady failures of private mass transit firms in all parts of the U.S. and in cities of all sizes. The industry in the aggregate ceased to be profitable in the mid-1960s for a variety of reasons. The growing inflation of the late 1960s was a serious blow to an industry that was fairly labor intensive. The cost of living was rising, and transit labor costs rose sharply as

> new contracts with transit workers' unions were hammered out. The cost of equipment and supplies also began to go up substantially, likewise due to inflation. If service was to be maintained, there was a limit to how much fares could be boosted and service cut. The aging fleet of transit vehicles grew inevitably older and more expensive to maintain, and there was little or no money in the transit property coffers for new equipment that was less costly to maintain. Marginal private operators all over the nation began to go out of business. An increasing number of cities—large, medium, and small—found that they would have to get into the transit business themselves if service was to continue. [Smerk, p. 110-111]

The evolution in transit was paralleled by a change in its trade groups. The American Transit Association, which began in 1882 as the American Street Railway Association, mainly represented privately owned bus companies. It did not effectively represent rail commuter or rapid transit operators who formed the Institute for Rapid Transit in the late 1950s. The association had not lobbied for government aid (in 1956, its primary goal was for buses to be exempted from the increased gas tax, a goal it achieved), but the institute would do so:

> From the start, the IRT membership understood the need for large sums of public money to revitalize and expand their properties. Many rail systems had suffered from decades of deferred maintenance; their leaders knew that local and state dollars were limited and that expanding the federal program in scope and in dollars appropriated was key to the success and survival of a reasonable quality of rail transit service. [Smerk, p. 109]

The fledgling Federal-aid transit program was subject to congressional funding decisions and subsequent appropriations acts, often based on political, economic, or other factors unrelated to transit needs. Without guarantees of future funding at levels to support the ambitious plans the Nation's cities were developing, transit interests sought to emulate the success of their highway counterparts who could rely on the Highway Trust Fund generating guaranteed revenue and contract authority to ensure its availability.

In early February 1969, Senator Williams and Representative Edward Koch (D-NY) introduced bills to establish a Mass Transit Trust Fund to collect revenue from the automobile excise tax. The 7 percent tax was set to drop to 3 percent in January 1971 and end by 1974, but Senator Williams proposed to leave the tax at 3 percent. Over 4 years, the new Mass Transit Trust Fund would accumulate $1.8 billion. Representative Koch, in his first term representing New York City in Congress, left the 7-percent rate in place to collect $1 billion in FY 1971 and $4 billion in FY 1974. His bill also removed the current cap of 12.5 percent on the amount any urban area could receive from total annual transit aid. The change, he said, would "enable the money to go where it is most needed—to the metropolitan areas."

(A June 1969 *Washington Post* feature about where new Members of Congress lived said that Representative Koch lived in Capital Park Apartments at 800 4th Street, SW, adding that he was "a 44-year-old bachelor, and the first Democrat elected in 31 years from Manhattan's Silk Stocking district. He walks to work and likes the accessibility of his present apartment, though he's looking for another one." [Wiegers, Mary, "Home From the Hill," *The Washington Post*, June 8, 1969])

Smerk explained why the bills and other interests pursuing a Mass Transit Trust Fund targeted the automobile excise tax:

> The money did not go into the Highway Trust Fund, and utilizing it did not seem likely to generate opposition from the highway interests who fiercely guarded the Highway Trust Fund against diversion to other than highway purposes. The automobile excise tax was attractive to legislators because it would not entail imposing a new tax. Proceeds were merely earmarked for a specific purpose rather than letting it go into the general fund of the U.S. Treasury. [“Transit Trust Fund Bills Are Introduced,” *Engineering News-Record*, February 27, 1969, p. 12-13; Smerk, p. 111-112]

Transit interests, as well as highway supporters, looked for signals from the new Secretary of Transportation about the direction of the Nixon Administration.

In the early months, Secretary Volpe reached out to the Department of Transportation’s constituents. He gave an interview for *Highway User* magazine’s February 1969 issue that touched on highway and transit issues. The interviewer began by noting the coincidence that as the first Federal Highway Administrator, Volpe had launched the Interstate System and as Secretary of Transportation he might bring it to a successful conclusion. Volpe replied:

> The coincidence is even more striking than your question indicates since it was Mr. Nixon, on behalf of former President Eisenhower, who presented the basic plan for completing the Interstate System to the Governors’ Conference in 1954. It certainly will be a source of satisfaction to me to work again with the States in pushing the Interstate program to the earliest possible completion as required by the law.

The Interstate program would end soon, but he emphasized that, “the traditional Federal-State highway program will never be brought ‘to a successful conclusion.’ It must continue to keep pace with the ever-increasing demand for personal mobility.”

Regarding the Highway Trust Fund, Secretary Volpe said “the integrity . . . must be preserved without question,” as was the intent of Congress and President Eisenhower in approving the Federal-Aid Highway Act of 1956:

> In my opinion, to divert highway use tax revenues to purposes other than the provision of highways would abrogate a long-standing moral commitment, as well as a statutory provision. The Trust Fund financing arrangement has been one of the essential ingredients in the present successes of the highway program and under no presently foreseeable circumstances should it be eliminated or diluted.

He also responded to a question about the future of rail rapid transit in large urban areas. Rail transit, he said, “certainly has a place” in larger urban areas:

> To be realistic, though, it is generally considered that rail rapid transit cannot be justified and successfully operated except in areas having at least 1,000,000 inhabitants. That

> severely limits its feasibility. There is a great future, I believe, in bus rapid transit, which is more flexible and can take advantage of such modern innovations as exclusive bus lanes on city freeways and other arterials. The surface of this possibility has barely been scratched, but we intend to promote the idea vigously. ["Secretary Volpe Tells Where He Stands," *Highway User*, February 1969, p. 4-5]

In an interview with the Associated Press a month later, he acknowledged that "bold new ideas" were needed for the Nation's cities. "If you get down to a point where automobiles have to travel five miles an hour, well, you know how long people are going to use them. They are going to walk to work instead of ride." He added:

> Some type of mass transportation has got . . . to get into operation pretty rapidly or we do face the real possibility that either we have to shut off to rubber tires certain limited areas within a city or charge a fee to come in there.

Highways simply could not get the job done on their own:

> But, by the same token, you just can't depend on a highway program to do the job completely, because it can't do the job. This has been proven in New York City . . . where over half a century ago—1917, I guess—the pushcart era—the average speed was 11 miles an hour. Today it's 7 miles an hour in New York. So we haven't made much progress in over half a century. So something needs to be done. And it needs to be done in a bold and imaginative way . . . .

The reporter asked about imposing user charges to discourage automobile use in central cities during business hours. Secretary Volpe replied that unless a lot more progress was made than in the last 5 years or so, "you're going to have to come to some type of restriction on certain areas within . . . the core city on the utilization of the automobile." He added that, "I would prefer to see the alternative of taking some people off the automobile tires if you provide good, swift, safe, economical mass transportation." Highways were going to be needed "as long as there's a United States of America," but "you are going to need mass transportation a great deal more and it's got to catch up." Moreover, if the Nation had promoted mass transit beginning in the mid-1950s the way it did the Interstate System, "we wouldn't be in the mess we're in today."

The reporter asked the Secretary's view of Senator Harrison Williams' proposal to create an urban transit trust fund to be financed out of automobile excise taxes:

> As far as I'm concerned, I believe the trust fund concept is one way to finance it . . . . It is one good way in which to make sure you will be able to finance over a specified period of time a specified number of miles of mass transportation that has been spelled out—similar to the highway program as it was spelled out in 1956 with a cost factor and a time factor to get it simultaneously completed in each state in the union.

He had heard that the highway lobby would oppose the use of automobile excise taxes for such a trust fund, but pointed out that "the excise tax funds . . . do not go into the highway trust fund." He did not think it made much difference which tax financed the proposed trust fund:

> As long as you have a specific tax, it's all going to the same pot right now, the general fund. So whether you take it out of the the automobile tax or you say 10 per cent of the cigarette tax, as long as you take a known tax provision now in the law and you say 10 percent of that, depending on how much that brings in, or 5 per cent or 15 per cent or 20 per cent of it. In other words, the only way you are going to be guaranteed that you'll have the money to do the job and get it completed over a specific period of time . . . is through that kind of an approach.

He also was asked if central city residents should have veto power over freeway construction in their neighborhoods. Secretary Volpe said that public agencies should listen to any responsible group. "But in the final analysis it is the elected or appointed officials who have to make some final judgments." He continued:

> Expressways are only one form. I'm convinced that you just don't stop a highway program because, perhaps, a few additional homes will have to be taken. [Hartnett, Ken, "Volpe Sees Immediate Need for Mass Transit Systems," Associated Press, *Fargo [ND] Forum*, March 27, 1969]

By April 1969, Secretary Volpe was publicly talking about a Mass Transit Trust Fund. On April 2, he said that the Subcommittee on Transportation of President Nixon's Urban Affairs Council had achieved a consensus in support of the idea. The source of revenue was undecided, but the automobile excise tax and the tax on cigarettes were under consideration. The subcommittee had rejected a direct user charge on transit passengers because, he said, "it would defeat the very thing we're trying to accomplish—getting more people to ride transit facilities."

Secretary Volpe said he was committed to the trust fund concept. "It's the only sure way suggested so far that over a course of time will really get the job done." He estimated that Federal expenditures between $10 billion and $100 billion would be needed in coming years to overhaul the Nation's transit systems. Only with an assured Federal funding source would local authorities be willing to launch the major construction projects that often require up to 10 years for completion. However, he opposed using Federal funds to subsidize operating expenses, which he felt would involve Washington in the business of running buses or subways.

Secretary Volpe expected the subcommittee to present a formal proposal to the council in two or three weeks and then to the President. He indicated that Secretary of Commerce Maurice Stans and Housing and Urban Affairs Secretary George Romney favored the idea, but the Bureau of the Budget and the Treasury Department opposed the plan based on their general opposition to trust funds. ["Transit Trust Fund," *Engineering News-Record*, April 17, 1969, p. 30]

Volpe told the Institute of Rapid Transit in a speech on April 17, 1969, that private transit companies "usually" could not make money. No city had a modern public transit system that could compete with the advantages of the automobile or adequately serve suburban areas, as well as a "ghetto dweller" who wanted to get to a job in the suburbs:

> We ought to rid rid of the idea once and for all that public transportation must make a profit at the fare box. I wish it could . . . . My position is that public transit is so important that we must look at its financing like most any other public service. We don't expect the Army to make a profit. We don't exact user charges for police protection. These services are considered so important that the entire community must agree to share the burden of supporting them. [Eisen, Jack, "Volpe: Transit Must Put Service Before Profit," *The Washington Post*, April 18, 1969]

With Volpe supportive, transit interests began to coalesce for action on addressing the growing transit problem:

> In early 1969, a coalition of interest groups began to form. A truly professional, consistent, and strong lobbying for transit had its genesis. The linchpin was the combination of the U.S. Conference of Mayors (or USCM, the new name of the American Municipal Association) and the National League of Cities (NLC). The Mayors' Conference and the League of Cities began to assemble a new mass transportation coalition, with Fred Burke, a highly skilled and effective lobbyist, employed to guide the work on the transit legislative program. The initial coalition included the NLC/USCM, the Institute for Rapid Transit, the American Transit Association, and the railroads working with IRT and the Association of American Railroads.

This coalition allowed the debate to expand beyond transportation to include urban revitalization and help for the urban poor. The coalition also made clear that it would oppose extension of the Highway Trust Fund unless highway interests backed the mass transportation program. Highway interests, aware of the growing opposition to highways and the Bureau of the Budget's desire to broaden use of the funds, agreed to support transit. "In short, seeing a fight ahead on the extension of their trust fund, the highway people felt it wise to support the transit constituency of the NLC/USCM." [Smerk, p. 112-113]

By mid-year, the American Transit Association had adopted creation of a Mass Transit Trust Fund as a major goal. The association's president for the year, S. A. Caria of the Minneapolis-St. Paul-based Twin City Lines, announced the decision in a speech to the New England Transit Club in Boston. He said that transit operators were "being asked not only to move people from 'A' to 'B,' but also to participate in the rescue of the American city." Operators could make "a major contribution but we do not have the resources nor should we be expected to have them."

The Urban Mass Transportation Act of 1964, he said, had resulted in a trickle of money, with the funds limited until 1968 to publicly-owned systems. Thus far, the legislation had provided "uncertain, hit-or-miss kind of assistance at best, not designed to attack the total problem on a broad front." Looking at the Interstate System, Caria said the secret of its success "lies both in the *total amount* of funds available through the trust fund, and in the *continuing nature* of that fund." He said the association's goal was supported by industry, the cities, the Executive Branch of government, and Congress, but acknowledged that some Members of Congress remained to be won over. ["A 'Trust Fund' for Transit?" *The American City*, July 1969, p. 130, emphasis in original]

(On December 26, 1968, Vice President-elect Agnew announced that Jerome B. Wolff, chairman-director of the Maryland State Roads Commission, would become his assistant. To ensure an orderly transition for the commission, the appointment would be delayed while Maryland held a special election to select a new Governor. "Mr. Wolff and I," Governor Agnew said from the State capital of Annapolis, "have agreed that he will make his services available to the new Governor for such time as may be required to effect an orderly transfer in the best interests of the State." Wolff's duties on the Vice President's staff would be flexible, according to the Governor, but would include only top-level assignments. ["Md. Official Named Aide to Agnew," *The Washington Post*, September 26, 1968] Wolff's title would be Advisor for Science and Technology.)

A Program for Urban Mass Transportation

The Administration seemed in tune with transit supporters about the need for a dedicated funding source. On May 9, 1969, Secretary Volpe was in New York talking about the coming Mass Transit Trust Fund. He did not specify where the funds would come from, although *The New York Times* observed that "in the past, he has indicated he favored the use of part of the current excise tax on new automobiles, possibly a new tax on cigarettes, or both." The report continued:

> The former Massachusetts Governor said proposed legislation calling for establishment of the mass-transit trust fund was being reviewed in the Treasury Department and the Budget Bureau. He said he expected to have the bill cleared for presentation to President Nixon within a week to 10 days. If all goes well, Congress would get the bill within a month . . . .
>
> Mr. Volpe told a reporter that he expected some resistance to his idea for a "trust fund" to help local governments build rapid-transit systems. But, he said with a faint grin: "I'm a fighter, and I expect to see this through."
>
> Much of the opposition to creation of a new earmarked trust fund, according to Adminstration sources, is that there is reluctance to remove what could be a sizable amount of Federal spending from the annual budget-drafting process. Since the money—as in the case of the $5.5-billion-a-year Highway Construction Trust Fund—is earmarked for a specific use, spending options are reduced.
>
> Mr. Volpe said the proposed legislation would call for a program running 10 to 12 years. The Secretary made clear that the bill would call for local sharing of the cost of the subways, rail lines and other types of mass transit that he envisioned for the cities. The formula had not been worked out yet, he said, but he suggested that the local portion might run in the neighborhood of 20 per cent to 40 per cent.

He expected the program to grow to "about $1-billion in two or three years." Asked how much New York State would receive, Secretary Volpe laughed and replied, "I'm afraid that's impossible to say. I'm sure New York City could itself absorb the $1-billion a year." He promised, however, to help the city get $200-million from the new program to help in financing "the $1.6-billion first phase of its massive new subway-construction program." [Lindsey, Robert, "U.S. Seeks Vast Aid for Mass Transit," *The New York Times*, May 10, 1969]

Rose found that, "Early on, Nixon's senior officials determined that securing additional finances for mass transit was their highest legislative priority." Volpe considered a trust fund for transit funded at about $300-$500 million a year by taxes on automobiles, cigarettes, and peak-hour fees for motorists on toll roads, but the idea made little headway within the Administration. The President was initially enthusiastic until his urban advisor, Daniel Patrick Moynihan, pointed out that the Bureau of the Budget and the Department of the Treasury were "fiercely opposed" to the trust fund concept. Volpe had tentative clearance for his concept by mid-July although an internal memo noted that "literally everyone at the White House preferred to finance the program out of general revenues." White House officials believed the trust fund concept worked only when the people being taxed would be the beneficiaries. [Rose, p. 110]

The mass transit trust tund idea "came to grief," as Smerk put it. The President took the advice of conservative economist and presidential senior advisor Arthur F. Burns, who led the fight against Secretary Volpe's proposal. Budget Director Robert P. Mayo and Chairman Paul W. McCracken of the Council of Economic Advisors sided with Burns. A bitter, unnamed aide to Secretary Volpe told a reporter, "The real stumbling block was that great 19th century economist with the pipe who has offices in the White House." ["Nixon Asks for $10 Billion for Transit," *The Washington Post*, August 7, 1969]

(Burns, as chairman of the Council of Economic Advisors (1953-1956), had played a key role in helping President Eisenhower develop his highway policy leading up to creation of the Highway Trust Fund and the Federal-Aid Highway Act of 1956.)

On August 7, 1969, President Nixon proposed an ambitious public transportation program. His special message to Congress on Public Transportation began:

> Public transportation has suffered from years of neglect in America. In the last 30 years urban transportation systems have experienced a cycle of increasing costs, decreasing funds for replacement, cutbacks in service and decrease in passengers.

Since most transit was provided by private companies seeking profit, the President added that:

> Transit industry profits before taxes have declined from $313 million in 1945 to $25 million in 1967. In recent years 235 bus and subway companies have gone out of business. The remaining transit companies have progressively deteriorated. Today they give their riders fewer runs, older cars, and less service.

Local governments, from the biggest cities to small and medium-sized communities, were ill-equipped to address the problem. For inspiration, the President turned to the Interstate System:

> When the Nation realized the importance and need for improved highways in the last decade, the Congress responded with the Highway Act of 1956. The result has been a magnificent federally-aided highway system. But highways are only one element in a national transportation policy. About a quarter of our population lack access to a car.

Unless public transportation became an attractive alternative to the private car, "we will never be able to build highways fast enough to avoid congestion." Already, the Nation faced "increasing congestion of our roads and strangulation of our central cities," he said, adding that, "we can imagine what our plight will be when our urban population adds one hundred million people by the year 2000."

He outlined his proposal to establish a public transportation program:

> I propose that we provide $10 billion out of the general fund over a 12-year period to help in developing and improving public transportation in local communities. To establish this program, I am requesting contract authorization totaling $3.1 billion for the first five years starting with a first year authorization of $300 million and rising to $1 billion by 1975. Furthermore, I am asking for a renewal of this contract authorization every two years so that the outstanding contract authorization will never be for a shorter period than three years. Over the 12-year period, $9.5 billion is programmed for capital investments and $500 million for research.
>
> The program which I am recommending would help to replace, improve and expand local bus, rail and subway systems. It would help to develop and modernize subway tracks, stations, and terminals; it would help to build and improve rail train tracks and stations, new bus terminals, and garages.
>
> The program would authorize assistance to private as well as public transit systems so that private enterprise can continue to provide public services in urban transportation. It would give State governments an opportunity to comment on project applications in order to improve intergovernmental coordination. It would require local public hearings before any major capital construction is undertaken. And it would permit localities to acquire rights-of-way in advance of system construction in order to reduce future dislocation and costs.

Under this program, the bus, train, and subway user would have better service. Cars would travel on less congested roads. The poor could get to new opportunities for training, rehabilitation, and employment, while city centers "would avoid strangulation and the suburbs would have better access to urban jobs and shops." He concluded:

> Most important, we as a Nation would benefit. The Nation which has sent men to the moon would demonstrate that it can meet the transportation needs of the city as well.

(Apollo 11 had landed the first men on the moon just a few weeks earlier, on July 20, 1969. The landing fulfilled President Kennedy's pledge on May 25, 1961: "I believe that this nation should commit itself to achieving the goal, before this decade is out, of landing a man on the Moon and returning him safely to the Earth.")

What the proposal did not do was establish a Mass Transit Trust Fund to "Secretary Volpe's apparent surprise, and to the consternation of the transit support coalition," according to Smerk. This decision was urged by the Bureau of the Budget "which resisted trust funds because it felt they limited the flexibility of government to react to changing situations, needs, and problems." [Smerk, p. 112]

In October, the Department of Transportation sent 40 people on a government plane to Montreal for the American Transit Association's annual meeting. On October 6, Under Secretary of Transportation James M. Beggs urged the association to support the President's proposal, adding that if they could not support it, he hoped they would at least not oppose it. "Very frankly, if you lose this bill, I do not think there will be another one for several years." He explained that the Administration's financial officials refused to endorse a trust fund financed from the general Treasury, while taxing transit passengers would be self-defeating.

The next speaker was S. A. Caria, the association's president. He stated flatly that the association could not support the proposal. Because it would require annual appropriations, actual funding levels were unpredictable and subject to fiscal restraints on government expenditures. The association, he said, preferred a trust fund.

That same afternoon, the association announced that its man-of-the-year award would go to Senator Williams because of his support for the trust fund concept. In a press conference, Under Secretary Beggs praised Senator Williams as the father of the transit aid program.

On October 8, Senator Williams told the association that a 5-year program was desirable for long-term planning, especially in cities developing rapid transit networks. However, he criticized the President's proposal as "merely a rehash of the same old program" requiring annual appropriations and accused the Administration of misleading rhetoric. What was needed, he said, were unquestioned guarantees of long-term Federal funding. He intended to continue promoting the trust fund concept with revenue from the automobile excise tax.

Mayor Thomas D'Alesandro III of Baltimore, representing the National League of Cities and the U.S. Conference of Mayors, said the two groups supported the Williams proposal. "There appears to be a puzzling lack of clarity and frankness in statements by the national administration about what its legislation is intended to do," he said, "and there appears to be unanimity among local government officials that it will not do what it is advertised as doing." [Eisen, Jack, "Transit Aide Pleads for Industry Support," *The Washington Post*, October 7, 1969; Eisen, Jack, "Trust Fund on Transit Supported," *The Washington Post*, October 9, 1969]

Secretary Volpe missed the annual meeting because he was representing President Nixon on a mission in Europe. Later that month, he addressed the Oklahoma Good Roads and Streets Association on highway safety and the Administration's views on mass transit. He described the growing demand on roads and airlines brought about by population increases as well as economic growth:

> To meet this kind of demand means, in sum, that we must within the next 20 years double our transportation capacity. We are not going to achieve this expansion by simply building more of everything. We are going to have to develop new techniques–a new systems approach to the movement of people and goods. There is nothing on the horizon to indicate the American people are ready to curtail their mobility by relinquishing the door-to-door convenience of the private automobile. At the same time, it requires only elementary mathematics to realize that the staggering increase of about 3½ million vehicles a year cannot continue indefinitely. If it does, we shall shortly reach a point in our cities where there is no more room to drive.

According to a report of the speech, Volpe was explaining the Administration's transit proposal when he adlibbed, "Not one dime will come from the highway trust fund." [Young, Jim, "Volpe Quiets Fears of Interstate Road Fund Raid," *Oklahoma City Oklahoman*, October 31, 1969]

The transit coalition worked hard to convince Members of Congress to support Senator Williams's bill. The Senator, with help from Burke, found one key to success by proposing a compromise between general funding and a Mass Transit Trust Fund. He proposed to apply "contract authority," a concept central to the Federal-aid highway program since 1922, to transit funding. Under contract authority, the Secretary of Transportation could incur obligations on behalf of the United States up to the limit of authorized funds. Congress pledged to appropriate the funds required to liquidate the obligations. Congress had approved contract authority for the Federal-aid highway program to allow State highway agencies to engage in multi-year planning. If the Williams amendment were adopted, transit officials would have the authority to make similar long-term commitments of funds.

In December 1969, the Senate Committee on Banking and Currency introduced its bill. Contract authority was included, but not the trust fund concept. One committee member, Senator William Proxmire (D-Wi.), objected to the inclusion of contract authority in the bill because it "shields the program from the annual appropriations process and reduces the ability of Congress to alter program priorities from year to year." He said the trust fund concept, while absent from the bill, was less objectionable because "revenues are specifically related to the program which it finances."

He also objected to the bill because it did not allocate a portion of the gasoline tax for mass transit:

> I believe a particularly good case can be made for financing the mass transit program out of gasoline tax revenues which heretofore have been used exclusively for highways. The beneficiaries of mass transit expenditures are not only the riders who pay a fare, but also auto motorists who benefit from reduced congestion and who pay nothing . . . . Gasoline tax revenues are thus a fair and equitable way of financing Federal mass transportation investments. [*Urban Mass Transportation Assistance Act of 1969*, Report of the Committee on Banking and Currency, United States Senate, to accompany S. 3154 (Report No. 91-633, 91st Congress, 1st Session, December 22, 1969, p. 34-35]

The Senate approved the bill 83 to 4 on February 3, 1970. The House Banking and Currency Committee, with jurisdiction over urban transportation, approved the House bill in June. The Rules Committee held up consideration until the Senate passed its bill again in September with a House-backed amendment on secret foreign bank accounts. The Rules Committee released the bill within 10 days of Senate Action, but members claimed they really did so only after a luncheon meeting with President Nixon who said the proposed program had a top priority. ["Mass Transit Act a Shoo-In Following House Passage," *Engineering News-Record*, October 8, 1970, p. 12]

The House passed the bill on September 29, 1970, by a vote of 327 to 16. The finished bill contained the first long-term commitment of Federal funds for mass transportation, with a commitment of at least $10 billion over 12 years, beginning with $3.1 billion in FY 1971. This funding commitment, including contract authority, would allow officials greater flexibility in planning transit development. In addition, the bill included a strong policy on transportation for elderly and handicapped persons and required public hearings on the economic, social, and environmental impacts of proposed projects as well as analysis of their environmental impacts. Funding was from the general Treasury, with no dedication of user taxes such as the excise tax on automobiles.

President Nixon signed the Urban Mass Transportation Assistance Act of 1970 on October 15. In doing so, he noted the bipartisan nature of support for the legislation, Secretary Volpe's hard work, and the leaders of business, transportation, and labor unions who worked to secure passage. He said:

> This bill . . . provides a very significant financial commitment on the part of the Government to mass urban transportation systems. And it will mean that we will find the methods whereby in the future we can move into the cities and through the cities of our country in a way that will enable life in those cities to be much more attractive than would be the case, when the cities are jammed with traffic, when the air is polluted because of what comes from the automobiles that is directly related to this, and where people, therefore, find cities becoming basically unattractive due in great part to the very fact that going from home to work is just too much of a chore.

In praising Secretary Volpe, the President noted that in assessing the record of his Cabinet, "my guess is that the highest batting average will be that of Secretary Volpe. I don't want him to get puffed up about it, because . . . it happens that transportation is one area where there is no partisanship." He added that, "I understand there are several other pieces of legislation in the transportation field that are on the way to the White House." One of them was the regular 2-year reauthorization of the Federal-aid highway program, due in 1970.

Public Attitudes Toward Highways

By the time President Nixon took office on January 20, 1969, public attitudes toward highways had changed since the day in July 1954 when he announced President Eisenhower's Grand Plan for highway development.

Following enactment of the Federal-Aid Highway Act of 1956, highway builders began construction of the Interstate System. The public, which relied on motor vehicles in ever increasing numbers, looked forward to the new superhighways. Once construction began in cities, however, the mood changed as projects removed homes, businesses, and neighborhoods. When homeowners and business owners protested, local officials had to confront a controversy no one had seen coming. Urban critics cited the Interstate System as one of the most destabilizing influences on the city, while local elected officials struggled to respond to their citizens' unexpected complaints.

The highway community, stunned by the response, thought that it could address the issue through public relations (PR). Perhaps, highway builders reasoned, they hadn't expressed clearly enough the benefits the public would receive from the new highways. Surely relief of congestion, revitalization of central cities, replacement of dilapidated housing, and improved safety were compensation enough for the disruption and displacement. They launched what today would be called a media blitz, including annual presidential declarations of National Highway Week. During the week, State highway agencies would hold open houses, issue press releases, stage highway opening ceremonies, and publish ads and articles in newspapers and magazines emphasizing the benefits of the new highways. (President John F. Kennedy declared the first National Highway Week for May 21-27, 1961, "in recognition of the vital role of highway transportation in our way of life.")

The environmental movement that coalesced during the 1960's raised new doubts about the impacts of the program on cities and our natural, historic, and other resources. Urban planners and critics, who had been skeptical of the Interstate program from the start, pointed out that the urban destruction they had predicted was coming true. During the same period, the Civil Rights Movement empowered African-Americans to question the routing of the new highways through their neighborhoods (sometimes stated in protests as "white men's roads through black men's homes"). The growing controversy over the Vietnam War increased public doubts about the wisdom and honesty of their elected leaders—and all authority.

Despite the highway community's public relations efforts, the public could see that the promised urban benefits of the new highways were increasingly in doubt. Congestion was not relieved. Suburbanization was not reversed; suburbs expanded as the new highways opened farms to development, leaving behind lower income residents who needed high levels of city services from a declining tax base. Far from being revitalized by the new highways, cities lost their tax base while incurring increased costs from riots that marred the urban landscape and psyche in the 1960s.

By the end of the decade, highway builders seemed increasingly like highway dinosaurs determined to build their roads no matter what the public wanted, no matter how many neighborhoods they destroyed, and regardless of opposition from Mayors and City Councils. A frequent image was that they were "paving over America." In 1970, Joni Mitchell sang:

> Don't it always seem to go,
> That you don't know what you've got 'til it's gone.
> They paved paradise and put up a parking lot.

The sentiment was shared not just by rock fans and hippies. A broad spectrum of academics, commentators, officials, planners, citizens, and especially protestors included highway builders among the "they" who were paving over paradise. [Mitchell, Joni, "Big Yellow Taxi," *Ladies of the Canyon*, Reprise Records, April 1970]

Gradually, builders realized the PR would not be enough. They became more responsive to the environment and sensitive to those displaced by highway construction, especially as the highway business was transformed by laws such as the Highway Beautification Act of 1965, the National Historic Preservation Act of 1966, Section 4(f) the Department of Transportation Act of 1966, the National Environmental Policy Act of 1969, the Clean Air Amendments of 1970, and the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970.

By 1970, the estimated cost of the Interstate System had increased to $69.87 billion for the expanded 42,500-mile Interstate System (Federal share: $62.5 billion). As of December 31, 1969, almost 29,640 miles had been opened to traffic (70 percent of the mileage), with 3,144 miles of this total able to handle current traffic but needing additional improvement to meet the ultimate standards. Construction was underway on 4,782 Interstate miles.

As the cost increased and the public protested, urban officials facing angry protestors clamored to eliminate Interstates but somehow keep the money their construction would bring to their city. No method existed to accomplish their purpose.

Critics pilloried the program in books, magazines, newspapers, and television programs. Members of Congress became increasingly impatient. With the 2-year program authorizations from the Federal-Aid Highway Act of 1968 for FYs 1970 and 1971 coming to an end, an article in the March 2, 1970, issue of *U.S. News and World Report* summarized the crossroad facing the highway community:

> Big decisions—and a hot battle—involving the nation's multibillion dollar highway program are shaping up in Washington.

The State highway agencies, working through AASHO, were asking for more – a spending boost from $11 billion a year to $21 billion through 1985 for a grant total of $320 billion:

> With that money, the States say they would build 53,000 miles of new freeways through the country, improve tens of thousands of miles of roads of less-than-freeway dimensions, correct 180,000 unprotected railroad crossings, replace 89,000 bridges that are deemed to be unsafe or inadequate, and develop a vast new system of expressways in the metropolitan areas. About 29 billions of the total would go to complete the 42,500-mile interstate highway system that was begun in 1956.

Securing the funds would not be easy:

> The States' dreams of a vast new building boom run headlong into mounting opposition, both private and official.

> Some federal experts say the U.S. already spends too much money on highways, and that some of these funds should be diverted to improve public transportation, especially rapid transit.

The article listed some of the problems facing the highway community:

- In the cities . . . there is stiff resistance to building more freeways through settled neighborhoods, where houses have to be torn down, and where residents worry about noise, fumes, and the traffic that tends to spill into adjoining areas.
- Outside the cities, conservationists criticize the impact of new highways on woodlands, wildlife and drainage.
- Increasingly, there is concern that the process of building superhighways may have no end. More roads seem to generate more traffic, which in turn requires more roads.

The article concluded:

> All this needs to be done, the State engineers say, in the interest of safety and better movement of people and products. The huge road-building boom they urge would also provide tens of thousands of jobs and absorb vast amounts of cement, steel, and construction equipment.
>
> Thus, the stakes are high as the battle over the future highway program begins. ["320 Billion Dollars More for Future Highways?" *U.S. News and World Report*, March 2, 1970, p. 8]

During the early years of the program, television, newspapers, and magazines had featured reports of waste, fraud, and abuse. These reports of what was sometimes called "The Great Highway Robbery" prompted calls to halt the program so it could be corrected. Urban critics joined in the calls for a moratorium. Ultimately, congressional investigators determined that the problems were isolated and could be corrected through the enhanced oversight being provided by BPR. The battle, by then, had shifted to the cities.

As the 1970s began, the media was again taking on the entrenched highway lobby. Mowbray's 1969 *Road to Ruin* was an example, as was the October 10, 1969, issue of the popular photo-essay magazine *Life*. Under the heading "Threatened America," *Life* published Paul O'Neil's article "Kill the Hill! Pave that Grass!" Adopting a reverse-psychology approach, O'Neil began:

> Fulminating segments of our citizenry lately made it fashionable to protest the construction of new, multilane superhighways, even when they are not being asked—and this may startle you a bit—to surrender their own houses to concrete and the common good . . . . Most of the malcontents are just as involved with cars as the rest of us, *need* new superhighways (known only a few years ago as "good roads") to run them on, and wouldn't go near a tree or a beach if they couldn't drive to it. There are a few hikers and deep breathers among them, true, and a few nuts who don't own automobiles, but these fine folks need new paving as much as we do; they, too, are subject to the car-truck-tire highway economy in which we all exist today.

As for parks, clean air, trout streams, grass, and secluded neighborhoods, "We'll all be better off . . . when we face up to the fact that they are rapidly being outmoded, and when we get it through our heads that the rights, needs and importance of automobiles have superseded the rights, needs and importance of humans in many areas of our culture." We would be a lot better off, O'Neil assured readers, if we would all just accept that "our children will adjust nicely to the noise, glare, exhaust-laden air and increasingly sterile landscapes of the future."

He added that the highway network is a marvel:

> American highway engineers have long since accomplished the world's greatest feat of construction: there are 3,600,000 square miles of land in the U.S. and they have built 3,600,000 miles of road across it—an accomplishment which makes the men who raised the pyramids of Egypt and the Great Wall of China seem like dilettantes . . . . The engineers have been thoughtful in the use of this power, too—they have tried their best to put their roads not only through unused wilderness areas (thus "opening them up" to motels and motorists) but through city parks—thereby saving the taxpayer's money and displacing hardly more than 100,000 people a year from their homes.

Sure, he said, we would be "subject to deafening waves of dissent as we press on with the task of making our great highway system even greater." And sure, superhighways "*do* cut towns in half, ruin the countryside, and make night hideous for those who live near them," so some might be a little sore about them:

> But a lot of us have already gotten sore—our new 41,000-mile Interstate highway system is presently gobbling up more right-of-way than is contained in the state of Rhode Island—and all the frayed tempers, cries of despair, letters to legislators and public meetings have not inhibited the advance of the road crews by a hundred yards.

Nor will those fruitless protests become more effective:

> There's a reason: the Highway Trust Fund—a pork barrel of such magnitude that no congressman, senator, governor or state highway official can possibly ignore it. The Fund sucks tax money out of the sale of spare parts and tires, and takes four cents from the price of every gallon of gasoline solid in the U.S. It puts all this treasure back into superhighways. Since every mile of road increases tire and gas consumption the Fund gets bigger—and spawns yet more roads—every year. It will go on doing so: a congressman risks political suicide if he does not bring home ready-for-the-asking federal funds, and a governor would be considered mad if he rejected such gravy.

President Johnson offered a cautionary tale for those who tried to interrupt the flow of money. When he tried to hold up the funds for fiscal reasons, he gave in after 6 months of being "filleted and fried by all the good old boys who didn't want their country deprived of a mile of paving it deserved." When he thought about it the next year, "the governors raised such hell ('Complete farce,' cried Pennsylvania's Raymond P. Shafer; 'Dishonest,' said California's Ronald Reagan) that he hastily lopped foreign aid, poverty funds and other such unimportant areas of fiscal endeavor instead." O'Neil added:

> "Any cutback in the highway program," as Maryland's Congressman George H. Fallon intoned, "would [have amounted] to breaking faith with . . . motorists." [O'Neil, Paul, "Kill the Hill! Pave that Grass!" *Life*, October 10, 1969, p. 126-134]

This article was in addition to a cover article in the May 30, 1969, issue of *Life* about "Our Deadliest Highways." For example, "Of the old deathraps, none is worse than two-lane U.S. 20, a coast-to-coast route that was built 49 years ago. In the western Illinois hills, the road is a winding ribbon—only 18 feet wide with no shoulders . . . ." A road signed warned motorists:

DANGER
ENTERING 55 MILES OF TREACHEROUS
HIWAY 20

["The Highways as a Killer," Crane, Ralph, photographer, *Life*, May 30, 1969, p. 24D]

Helen Leavitt's 1970 book, *Superhighway-Superhoax* (Doubleday and Company, 1970) was a denunciation of every aspect of the highway program. She was a free-lance writer in Washington, D.C., who had become interested in highways when the city was planning a freeway that would take her townhouse. The book jacket assured readers that "we are strangling in a concrete straitjacket that pollutes the environment and makes driving a nightmare." Leavitt attacked the urban Interstates, the highway lobby, and the Highway Trust Fund. The "never ending flow of Highway Trust Fund money," she said, had created "the vast imbalance in our transportation situation." As a result, "the highway program is simply not subject to the same competitive pressures as other programs." The Highway Trust Fund and its State counterparts "must be eliminated as an exclusive conduit of money for highways." [Leavitt, p. 277-278]

One of her central ideas was that transportation "planning" was "guided by funding, not the other way around," since "there was no money available for alternatives." She considered the "strong sentiment" for a separate mass transportation trust fund unfortunate:

> As tempting a prospect as this seems, it would only create a new boondoggle. Trust funds are bad policy. However purely motivated their sponsors, such aggregations of money take on a life of their own. Should such a mass transportation trust fund be established, by whatever means, it is quite likely that every one of our urban areas would soon be covered with a complex of subway stations, whether they made any transportation sense or not . . . .
>
> Not surprisingly, Secretary of Transportation Volpe, a highway enthusiast and champion of the Highway Trust Fund, has endorsed the creation of a special trust fund for mass transit. He believes this will fend off enemies of the Highway Trust Fund. [Leavitt, p. 279]

She added that President Nixon's proposal of a 10-year mass transit program had sidetracked Secretary Volpe's trust fund concept, but it had also been "rejected by the fifty governors." They preferred the proposal to dedicate revenue from the automobile excise tax to a Mass Transit Trust

Fund that would guarantee funding outside the competitive congressional appropriations process. [Leavitt, p. 280]

Leavitt supported continued taxation of highway user products. The use of that revenue was her concern:

> [At] both state and federal levels, the money should go into *general funds* so that highway boosters will, for the first time since 1956, have to *compete* for priorities, instead of being automatically funded. [Leavitt, p. 277]

An editorial in *Better R*oads magazine called the book a "slam-bang attack," but acknowledged that "Helen Leavitt is not some Johnny-come-lately reporter who stumbled on a controversial subject and wrote a book about it." Her "rather single-minded point of view" was nurtured "in the fight to stop freeway construction in the District of Columbia." The editorial continued:

> The author has been diligent in her research. Her book is a considerable catalog of highway-department bad guesses, poor judgments and assorted idiocies. The unfortunate fact, of couse, is that such things did happen. In retrospect they look terrible. The fact also remains that in too many instances too many highway departments were insensitive to what later became hard-core public opinion. Where they have sowed the wind, they have been reaping the whirlwind. And once such an uproar has begun it seldom goes completely away. Mrs. Leavitt's book is a case in point.

Being single-minded, she saw mass transit as "the be-all and end-all for cities." Some of her suggestions "have merit," but "we doubt that highways—even urban highways—will ever get as low on the priority scale as she seems to think they should." ["Another Critic Views Urban Freeways," An Editorial Viewpoint, *Better Roads*, June 1970, p. 4, 7]

The Road Gang, which began in 1942 as an informal luncheon forum for the exchange of ideas by public and private executives whose interests were broadly related to highway transportation, invited Leavitt in 1970 to defend her book. It was a contentious event, as described in *Road Gang Goes for the Gold*, published in 1992 to celebrate the group's 50th anniversary:

> Another "first" was a woman guest speaker, Helen Leavitt, who not only drew a large attendance but sparked some of the liveliest, if not the loudest, discussion in Road Gang experience. In the words of Chairman [Charles W. "Bill"] Day, who even used his horn to help sustain order, the debate was "brisk."
>
> Others remember the meeting as loud, maybe even a bit raucous.
>
> Leavitt came to the Road Gang to defend her controversial new book, "Superhighway, Superhoax," a strongly-worded, put-down of the nation's highway program, which she said amounted to a "concrete straightjacket that pollutes the environment and makes driving a nightmare, the most destructive and inefficient transportation system available."

The recollection concluded by pointing out that the Road Gang "has grown and prospered" since then. Meanwhile, Leavitt's book "has since gone out of print." [Knight, Don, editor, *Road Gang Goes for the Gold*, A Special Commemorative Newsletter Tribute to the Road Gang, June 25, 1992, p. 5]

(In 1996, the New York Public Library included Leavitt's book among the Books of the Century. "The book's argument and central paradox, that most superhighways bring increased traffic congestion rather than less, has never been effectively countered." The citation noted some of her criticisms, "most notably, she demonstrates environmental degradation, strangled cities, and ruined public transportation systems." [Diefendorf, Elizabeth, Editor, *The New York Public Library's Books of the Century*, Oxford University Press, 1996, p. 147])

Around the same time, David Hapgood, senior editor of *Washington Monthly* magazine, criticized the Highway Trust Fund in an expose of "The Highwaymen." His indictment was similar to that of other critics, including Mowbray and Leavitt. He told readers that, "Nothing generates more financial return, legal or otherwise, to those in office than highway construction." The 1956 plan for financing the Interstate program "was a classic raid on the Treasury." He continued:

> In the annals of lobbying, the highwaymen who executed this coup deserve to be listed alongside those Chinese contractors who convinced the Ch'in emperors to build the Great Wall of China. There are certain similarities between the two operations.
>
> The Great Wall was supposed to keep out Mongol invaders. The highway lobby's trump card was the claim that what it got Congress to call the "National System of Interstate and Defense Highways" would serve to move military units in case of war—making opposition to it seem somehow unpatriotic . . . . The Great Wall did not keep the Mongols out, but the Chinese kept building it over the centuries. Similarly, the interstate highways would be of no use in a 24-hour nuclear war, but, in 1968, Congress added on another 1,500 miles to the system. Doubtless the Great Wall lobby in its time, like its American counterpart now, argued that the economy would go into a tailspin if the local contractors were deprived of work.
>
> The arrangement by which money would be made available to finance the highwaymen's mandate was the lobby's greatest accomplishment. This arrangement, which cynics call the Ever-Normal Trough, requires that all revenues from the federal gasoline tax—now 4 cents a gallon—and other highway-related taxes (tires, spare parts) be set aside for highway construction alone. Instead of having to engage every year in the kind of undignified scramble for federal money that takes place over the Rivers and Harbors Appropriations bill, the highway lobby draws its sustenance from a trough that is refilled automatically every year without legislative appropriation . . . .
>
> In a moment of inspiration, Congress named this device the "Highway Trust Fund." The idea is that the taxes are paid by people who use the highways and must be held in sacred trust for more highways. To use the money for any other purpose, the argument goes, would be to violate that sacred trust. Representative Jonathan Bingham (D-N.Y.), one of the small

> band of guerrillas who resist the highwaymen, asked not long ago what would happen if the principle of the Highway Trust Fund were to be applied to the federal tax on alcoholic beverages. Would the alcohol tax be spent only on building bars?

Referring to efforts by Representative Ryan and others to divert some of the funds to mass transit (the measure the highway lobby "hates most"), Hapgood said that such efforts are supported only "by about a dozen other members of House." He quoted one of those supporters, Representative Richard (Max) McCarty (D-NY), as saying his colleagues treated the idea as being the equivalent of "burning the flag!"

Hapgood summarized the Administration's urban mass transportation proposal, which at the time Congress was still considering. "Of course, Congress would have to appropriate the money, and the Nixon-Volpe team opposes a mass-transit trust fund as much as they favor the highways' Ever-Normal Trough."

Still, "the odds against those who oppose urban highways today are somewhat less than they were" just a few years earlier. And the highway lobby was facing a reckoning:

> A large battle over the future of the entire Interstate Highway Program is shaping up for the early 1970s, and the lobby has already begun preparing for that fight. The precipitating factor is the expiration date of the "trust fund." Created in 1956, the trust fund was originally due to expire in 1972; it has already been extended to 1974. No one can expect the highwaymen to give up $5 billion a year without a fight.

That lobby, Hapgood explained, was "paid and professional," in contrast to highway opponents who tended to focus only on the project affecting their homes or livelihoods. "City antihighway groups usually disappear as organizations after their own battles are lost or won." The individual dissidents—such as residents, business owners, conservationists, planners, and environmental scientists—had not coalesced into a national pressure group. However, he saw them as part of a larger adjustments as the country reacted to the economic, social, and political changes of the 1960s:

> The highway revolt is against the tyranny of the machine—the highway bulldozer and the political machine that drives it. Being helpless before the highway lobby is just one form of the powerlessness that Americans increasingly resent. Seen from this perspective, the battle between city people and the highway establishment is one front in the developing struggle between those who want to redefine America and those who want to keep it the way it was.

[Hapgood, David, "The Highwaymen," *Inside the System: A Washington Monthly Reader*, Peters, Charles, and Adams, Timothy J, editors, Praeger Publishers, 1970, p. 141-142, 154-155]

These images—the unstoppable "highway bulldozer," the ever-flowing Highway Trust Fund, and the unrelenting "highway lobby" battling desperate homeowners and far-sighted critics—had come to dominate public perception as Congress began work on the next Federal-aid authorization legislation.

The Highway Lobby Fights Back

Federal Highway Administrator Frank Turner did not appreciate such criticism. As he told AASHO during its annual meeting in October 1969, a "current day mythology" had arisen of "myths that have no relationship to reality, but nevertheless are being talked and written about to attract the attention of some of the public who would rather believe in fancy than facts." He cited some examples:

- **Highway lobby?** It consists of "our 101 million motor vehicles" and "includes most of the rest of our 200 million people."
- **Paving over America?** The mileage of roads had increased "less than ¼ to a total of 3.7 million miles," compared with 3 million when the Federal-aid highway program began in 1916 – "while population has doubled but vehicles have increased thirty-fold."
- **Traffic moving slower today than in the horse-and buggy days?** "This is always good for a chuckle or a 'horse laugh' but it too is without factual substance."
- **Rail transit can substitute for highway transportation?** In larger cities, rail transit might supplement highways, but elsewhere, mass transit meant buses. "To talk about rail transit as the single, simple panacea for all the nation's transportation problems in every urban area simply does not jibe with reality." That is one of the reasons he supported the Administration's urban mass transportation bill. "Please note that the bill would permit both-or-either rail and bus types of mass public transit."

He added:

> In dealing with the real world of today we must base our actions on sound basic information and constantly apply the trained professional expertise and experience which we have learned. We cannot be motivated by simple hunches and emotions.

The danger facing the highway community from the widespread criticism, myths and otherwise, was not lost on the members of AASHO. Its president, Ross G. Stapp of the Wyoming Highway Department, told members:

> Because of the attacks from every quarter on the highway program and because of the jeopardy the Highway Trust Fund has been placed in, it is evident there is a deepening crisis in the highway program. Our mission in AASHO and in the highway community is not just to live with the crisis, but to exert every effort toward reversing the trends considered not to be in the best public interest.

Some progress had been made through such initiatives as National Highway Week. Stapp was certain that highways were supported "by a silent majority of the people in the country," but unless they spoke up, "certain interests could so slow down the highway improvement program to a degree which could result in an inadequate highway system for an ever increasing demand within a few years."

The challenges were obvious:

> Diversion of Highway Trust Fund monies is one of the most pressing current and long-range problems that AASHO and the highway industry faces. AASHO must devote its resources to maintain the integrity of the Highway Trust Fund . . . . It is distressingly simple but alarmingly catastrophic that if these raids on the Trust Fund, this highway robbery, is allowed to succeed we simply cannot have any long-range programs.

He acknowledged that other needs existed, such as urban mass transportation, but "the Highway Trust Fund must be utilized exclusively for solving highway problems."

Protecting the Highway Trust Fund "will be no mean task," but one step would be to "do everything within our power to dispel the image we have, unfortunately and inadvertently, assumed in the eyes of some of the public." They would have to convince the public of the falseness of the "image of the autocratic highway builder who builds with little or no concern for the urban dweller, for the suburban dweller or the rancher or the farmer or whomever is affected by our highways . . . ."

A feature of the 1969 annual meeting was a roundtable discussion among Stapp, AASHO's incoming president Douglas Fugate of the Virginia Department of Highways, and several Members of Congress, including Representative's Fallon, Kluczynski, and William R. Harsha of Ohio, the ranking Republican on the Committee on Public Works. Harsha warned AASHO that in view of the widespread criticism, "1970 is going to be a highly critical year for the future of the highway program." He continued:

> In fact, it may be one of the most important years for that program since the inception of federal aid highway construction . . . . [You] can no longer afford to sit idly by and say that things will take care of themselves. The opposition is not sitting idly by and it is articulate and persuasive, and your role as highway officials and department heads in the states should reflect the needs and the public attitudes in all of the states. You will be called upon to play a major role in the formation of any legislation next year. Your role in meeting this responsibility will be a most important one, and let me caution you that you must meet this challenge aggressively, effectively, and thoroughly. If you fail or shirk in exercising this responsibility, others will accept it and you may not be happy with those results.
>
> I sincerely believe the future of the highway program as you conceive it hangs in the balance, so again let me urge you to play the role that is yours in meeting these challenges which confront the Congress next year.

On March 2, 1970, Secretary Volpe reassured participants in ARBA's annual meeting that "highways are here to stay" and that "despite what some people say we must keep our highway program." Highways "will never solve all of our future transportation challenges," which meant the country needed a strong mass transportation program. He told a press conference, however, that he did not favor the use of highway funds for mass transportation. He preferred separate accounts for rail, highway, air, and public transit. [Goldsand, Alan, "Volpe Assures Builders on Federal Road Funds," *Journal of Commerce*, March 3, 1970]

Despite these assurances, cracks were evident in the foundation of the Highway Trust Fund. In May, *Engineering News-Record* ran an article headlined "Highway Trust Fund Isn't Sacred Anymore." It began:

> As Congress warms up to consider future federal-aid highway program, the sanctity of the Highway Trust Fund is coming under increasingly strong attack.

The article said that Senator Proxmire, during a subcommittee hearing of the Senate-House Joint Economic Committee, had suggested that the Department of Transportation propose extension of the Highway Trust Fund only long enough to complete existing authorized systems. That would carry it only to 1974:

> Proxmire favors a broader approach to financing federal transportation programs, as does Transportation Secretary John Volpe, who says he will recommend a national transportation trust fund before the end of the year. The political climate is not right just now, he feels. "We have a great deal of education ahead of us if we are to convince industry and Congress."

As part of that education process, Volpe had participated the previous weekend in the spring meeting of the Business Council, telling the "blue-chip company chiefs" that, "I doubt very seriously whether you can get a change in thinking that will allow a diversion of the Highway Trust Fund to nonhighway uses." In the near term, he saw the possibility of using Highway Trust Fund revenue for highway safety, national forest roads, and other matters directly related to highways. However, he said that he would be working for a flexible general fund. He advocated four designated accounts (highways, aviation, urban transportation, and one not specified), but with the States being able to transfer funds among the accounts

Appearing before the Proxmire subcommittee, Peter S. Craig, former Assistant General Counsel for Litigation under Secretary Alan Boyd and a leading opponent of freeway plans in the District of Columbia, had said that assigning highway user tax revenue to highways "makes about as much sense as earmarking all federal estate taxes for use of the deceased only." He thought that "the time is overdue . . . to turn to other options providing democratic, local responsibility for public transportation expenditures."
Urban needs were of particular concern, in part because of the transformation of transit from a private to public enterprise. Harvard Professor of Economics John F. Kain had told the Proxmire panel that linking highways and mass transit construction would result in "revolutionary improvement in the quality and quantity of urban transportation services . . . in every U.S. metropolitan area in a relatively short period."

Highway advocates disagreed. Yule Fisher of the Highway Users Federation for Safety and Mobility (HUFSAM) had defended the Highway Trust Fund during testimony before the House Subcommittee on Roads. For at least 15 years, highway needs "will require all the funds in sight." He added, "It is imperative that the Highway Trust Fund be extended and dedicated exclusively to highway purposes." Speaking on behalf of AASHO, Douglas Fugate "joined a long line of witnesses who proposed extending the trust fund, some through 1985."

Clearly, the article summarized, “the highway program is not the darling of Congress that it once was.” [“Highway Trust Fund Isn’t Sacred Anymore,” *Engineering News-Record*, May 14, 1970]

National Transportation Trust Fund

On February 13, 1970, the Proxmire subcommittee issued a report on “Economic Analysis and the Efficiency of Government.” It recommended abolishing the Highway Trust Fund and other trust funds (excluding the Social Security Trust Fund) because “the trust fund mode throws the budget out of control and effectively insulates programs from the effective congressional scrutiny which efficiency demands.” Trust funds also channeled benefits to higher income classes and regions, with the benefits “free of charge.” They “foster serious overspending on some programs and [have] created undue pressure for increased public support by those subsidized.”

Senator Proxmire, the chairman, said the subcommittee opposed trust funds because they left Congress “operating in the dark” in analyzing the value of potential Federal expenditures. Congress should scrutinize needs annually and approve appropriations to meet proven needs in the normal way. (In his comments on the Urban Mass Transportation Assistance Act, he had raised similar objections to contract authority and suggested that a Mass Transit Trust Fund would obviate the objections, but his comments here were outside the context of the contrast with contract authority.)

The report also recommended that authorizing committees scrutinize the objectives, effectiveness, cost, and benefits of each program under its jurisdiction. This periodic review “would eliminate the possibility that inefficiencies and inequities would become buried in the past and remain undetected for years.” Further, Congress should automatically review each Federal program every 5 years “from the ground up” to determine if they remained useful.

One member of the committee, Senator Charles H. Percy (R-Il.), disagreed with the conclusion on trust funds. He said that, “in a theoretical and fiscal sense, such a recommendation has considerable merit.” However, it “lacks practicality in the real world in which we live.” Trust funds were not an “economic panacea,” but “facing political and social realities, the concept when properly used may provide the most effective means to allocate governmental financial resources.” As for the Highway Trust Fund, he did not support its termination, but rather “its conversion into a transportation fund” to support a balanced transportation system. [Cohn, Lee M., “Congress Unit Asks End of Highway Trust Fund,” *The Evening Star*, February 14, 1970, “Abolition of Trust Fund Sought in Joint Congressional Report, *Transport Topics*, February 23, 1970]]

In August 1970, the Joint Economic Committee issued a report on *Federal Transportation Expenditure* that repeated many of the concerns about the Highway Trust Fund. It recommended:

- A unified approach to decisionmaking on transportation funding, including full review of alternative ways of meeting a need and the priority relative to other possible uses;
- Congress should incorporate comprehensive analysis of social costs and benefits into its funding decisions, particularly regarding the remaining segments of the Interstate System;
- Transportation expenditures should be subject to budgetary review, with the Highway Trust Fund phased out;

- Highway programs should contain incentives for developing efficient road pricing, including tolls, to reduce urban road congestion and obtain efficient allocation of resources; and
- States and localities should be able to use Federal aid in the most efficient way possible instead of being restricted by funding source, as was the case with Highway Trust Fund revenue. [*Federal Transportation Expenditure*, Report of the Subcommittee on Economy in Government of the Joint Economic Committee, Congress of the United States, Joint Committee Print No. 9, 91st Congress, 2nd Session, August 17, 1970]

(Senator Proxmire would raise his concerns again in his 1972 book *Uncle Sam—the Last of the Bigtime Spenders* (Simon and Schuster). He said of the Highway Trust Fund:

> The highway trust fund effectively insulates the highway program from policy planning, economic analysis, and Congressional scrutiny. It does this not only because funds are allocated by formula instead of on the basis of demand, benefits, and cost; it does it also because the formula is based on the past use of highways rather than on the prospective demand which should be efficiently met.

(In a section with the subhead "The Highway Trust Fund Frustrates Intelligent Action," he said, "One could hardly devise a system better designed to frustrate and thwart intelligent attempts to make choices or properly order priorities." [Proxmire, p. 270] He added that in the Department of Transportation Act of 1966, Congress had prohibited the new Department from considering cost versus benefits:

> The act reads: "The Secretary . . . shall develop and . . . revise standards and criteria . . . for the formulation and economic evaluation of all proposals for the investment of Federal funds in transportation facilities or equipment, except such proposals as are concerned with . . . (6) grant-in-aid program authorized by law."
>
> The key "grant-in-aid programs authorized by law" is the highway program. No economic evaluation of the investment of funds in highways can be made. This was the price the highway lobby extracted for its support to establish the new department, out of fear that such studies would lead to more funds for mass transit and less for highways. [Proxmire, p. 33-34])

On February 26, 1970, the Senate Committee on Commerce had opened hearings on the Rail Passenger Service Act (S. 924) and the National Transportation Act (S. 2425). Chairman Warren G. Magnuson explained that, "The economic and social conditions of every nation are shaped, to a large extent, by its transportation system," but given the "economic, social and environmental costs of our present transportation network," the need for a "fresh look at transportation in America becomes more imperative." The National Transportation Act required the establishment of regional transportation commissions charged with the planning and construction of integrated transportation systems taking into consideration such factors as environmental quality, land-use planning, and the location of pipelines and power transmission facilities. The hearings, Chairman Magnuson said, were intended to examine the accuracy of common assumptions:

> The first assumption is that our present transportation system is not really a system at all, but rather a combination of various sub-systems that bear little or no relation to one another. Second, we assume that this "non-system" is costly to America, for social and environmental reasons as well as for the more obvious reason that traffic congestion in all modes of transportation has reached the crisis point. Third, we assume that technological solutions to our urban and interurban transportation problems have been or can be developed. Fourth, and perhaps most importantly, we assume that rational implementation of such solutions requires an appropriate political framework within which transportation policy can be made, and that such a framework does not now exist. [*National Transportation Act*, Hearings before the Committee on Commerce, U.S. Senate, 91st Congress, 2nd Session, Serial 01-69, p. 1-2, 50]

On April 14, Senator Edward M. Kennedy (D-Ma.) testified before the committee in support of regional commissions. The National Transportation Act, he said, "gives us the opportunity to do what we should have done 30 years ago—an opportunity to plan, develop, and execute rational regional transportation systems that are linked coherently to a comprehensive national transportation policy." To achieve "a more balanced and coordinated system," regional commissions would be able to "determine the most effective use of the new technologies already available . . . in light of the overall transportation needs of the corridor—not independently by individual Federal agencies, States or cities."

Senator Kennedy took the opportunity to ask the committee to consider creation of a national transportation trust fund "to replace existing funds and to provide the financing needed for the development of a balanced, intermodal transportation system for the seventies." At present, supporters of each mode "tend to compete with each other for funding under our present laws." He said:

> Without congressional action to establish such a fund, I fear that the programs authorized under this legislation and the goal it sets for the achievement of a transportation policy are doomed to failure, We must recognize the fact that separate trust funds, almost necessarily, are self-perpetuating. They continue long after they have fulfilled the purpose for which they were established. [*National Transportation Act*, p. 225-226]

Secretary Volpe testified the following day. He was supportive of comprehensive planning, but identified several problems with the regional concept, such as establishing boundaries. During questioning, Senator Vance Hartke (D-In.), chairman of the committee's Surface Transportation Subcommittee, asked if Secretary Volpe thought the bill should be amended to include a national transportation trust fund. The Secretary said he supported the overall concept, but added:

> Mr. Chairman, I would be very frank to state I do not think the climate at the present moment is such that you would be able to get the kind of support and have as well thought out an arrangement for a total transportation trust fund which I believe is absolutely essential to its success.

Such a fund would have "many ramifications" and "hopefully [we] can identify the many problems and come up with some suggestions for solutions . . . . But they are not easy of fulfillment." He hoped to have a proposal on the concept by the end of the year. What he had in mind, he said, was something similar to how the Federal-Aid Highway Act of 1956 established the Highway Trust Fund to complete the Interstate System simultaneously in all the States within a specified time frame. "What we have to achieve is something along the same line that would provide for this total transportation concept and do the total job on an intermodal basis." [*National Transportation Act*, p. 256-257]

Representative Koch introduced H.R. 18319 on July 7, 1970, to create a unified transportation trust fund. In extended remarks printed in the *Congressional Record*, he said:

> My bill is designed to cut across the rigid modal patterns that today restrict the development of a balanced transportation system and which result in inefficient and distorted uses of our transportation resources.

Title I of the bill required the Secretary of Transportation to develop a comprehensive plan for the use of the Nation's transportation resources to implement national transportation policy. Title II created a single transportation trust fund from the existing trust funds for expenditures in accordance with the comprehensive plan. "It will unify and coordinate the way we spend our money on transportation and lead to more effective utilization of our resources." Title III was essentially the mass transit bill he and Senator Williams had introduced in February 1969 to establish a Mass Transportation Trust Fund, with revenue from the 7-percent Federal excise tax on new automobiles, to provide "increased revenues for, and expand the effectiveness of our programs for dealing with our most urgent national transportation problem—the movement of people in our crowded cities."

Representative Koch understood that "the reorientation of our Nation's transportation system that my bill calls for cannot be accomplished overnight." Therefore, his bill outlined steps:

> Effective July 1, 1971, the bill would create a single transportation trust fund consisting of first, the present highway trust fund; second, the airport and airway fund adopted by the Congress this year; and third, a new mass transportation fund based on the automobile excise tax. In 1972 all highway trust fund moneys would be included in the single transportation trust fund. This new unified trust fund would be the source of all transportation expenditures for the decade of the 1970's.

He held off proposing major changes in the transportation programs until the Secretary of Transportation submitted his comprehensive plan:

> In that plan, the Secretary would outline the expenditures required during the next decade in order to achieve a balanced transportation system in accordance with the national transportation policy. He would also recommend to the Congress how the transportation functions within the Government should be reorganized in order to assure effective coordinated policy management cutting across rigid modal lines.

He concluded:

> New approaches to America's transportation problems are already long overdue. If we are to prevent strangulation of this Nation's transportation life line, we must act now. [Koch, Edward I., "A Bill to Create a Single Transportation Trust Fund," *Congressional Record-House*, July 7, 1970, p. 23088-23089]

The bill, which is thought to be the first introduced calling for a Transportation Trust Fund, was referred to the House Ways and Means Committee, which took no action on the measure. [Davis, Jeff, "The 'Transportation Trust Fund Idea, 40 Years On …," *Transportation Weekly*, April 29, 2011, p. 1, 6]

In July, Senator Randolph, who would play a key role in developing the highway legislation, felt compelled to respond to an editorial in *The Washington Post* criticizing the Highway Trust Fund. His committee's 15 days of hearings on the needed 2-year reauthorization had revealed "some sentiment" for broadening the purposes of the Fund. He did not advocate an indefinite continuation of the Highway Trust Fund as now constituted, but it had not yet completed its primary purpose of financing construction of the Interstate System:

> What will happen several years in the future I cannot predict, but I feel it is necessary to retain the trust fund in essentially its present form until current Interstate and Defense Highway system commitments are met.

He acknowledged that some urban segments were controversial and might never be built:

> Because of this, I have asked Transportation Secretary Volpe to explore with the appropriate state and local officials the feasibility of considering these controversial segments for removal from the Interstate system at a possible saving of $4 billion.

Further, he supported some expansion in the use of highway user tax revenues. In December 1969, he had introduced a bill that would allow cities to use the funds for public transportation systems, mainly buses on highways, and expanded the uses to include highways on public lands and a bridge replacement program.

He thought the Interstate System could be completed in 7 years, after which "I have been repeatedly advocating establishment of a single formula for allocating federal funds, perhaps on the order of 70-30, with the states having wide latitude in determining where this money should be spent." [Randolph, Jennings, "Senator Randolph and the Highway Fund," *The Washington Post*, July 29, 1970]

Randolph, a longtime highway supporter, had served in the House of Representatives from March 4, 1933, to January 3, 1947. As a ranking member of the House Subcommittee on Roads, he played a role in passage of the Federal-Aid Highway Act of 1944, which authorized designation of a National System of Interstate Highways. He also played a role in early airport legislation.

In the Republican mid-term election sweep of 1946, Randolph lost his bid for reelection. He took a position as an assistant to the president of Capital Airlines and, in January 1948, was elected vice president of ARBA's Airport Division (later the Municipal and Airport Division). He would serve ARBA as treasurer for 10 years before resigning to run in a special election to replace the late Senator Matthew M. Neely (D-WV). On November 5, 1958, he won the election and was reelected every 6 years until he chose not to seek reelection in 1984. He became Chairman of the Public Works Committee in January 1965. ["Jennings Randolph Elected to Senate," *American Road Builder*, December 1958, p. 21]

Even as Congress, the Administration, and transportation interests debated the shape of 1970 legislation, the use of the Highway Trust Fund as an anti-inflation tool remained alive, as *National Journal* discussed in July. After taking office on July 1, Office of Management and Budget (OMB) Director George P. Shultz had proposed cutting funds for highways by $1.3 billion to $3.6 billion in FY 1971. (The Bureau of the Budget was reorganized by Executive Order 11541, July 1, 1970, to become OMB.) The intent was to curb inflation by reducing Federal spending and make nonpublic funds available to the Treasury to reduce its borrowing in the private market.

On July 9, when OMB had not reversed its position, Volpe cut short his vacation in the Virgin Islands and flew back to Washington to intervene personally. Between July 9 and July 13, Volpe attended numerous meetings in the Executive Office Building, sometimes accompanied by Administrator Turner. The *National Journal* summarized Volpe's argument:

> One department official said Volpe argued for restoration because he believed the Administration had "made a commitment—a *moral commitment*—and it must be responsive to that commitment so the states could proceed with their programs."
>
> The "moral commitment," the official said, was made in September 1969 when President Nixon asked governors to cut federally aided highway construction by 75 per cent to help curb inflation. Twenty-four states deferred highway programs totaling $945.6 million with the understanding that the funds would be made available in fiscal 1971 on a priority basis.

Volpe also feared the cutback would jeopardize his proposal to expand the Highway Trust Fund to cover highway beautification and safety programs. In the end, Volpe engineered a compromise:

> Presidential budget specialists, after five days of hard bargaining early this month with Transportation Secretary John A. Volpe, have reluctantly agreed to release about half of $1.3 billion highway funds they had planned to freeze during fiscal 1971.

The highway interests had aided Volpe once word of the proposed cutback leaked. As Alfred E. Johnson, AASHO's executive director, told the magazine:

> The state highway departments are generally getting fed up on this indecision and delay every year by congress. They wonder why, when the funds are there, and the authorizations are there, why they can't get their jobs finished.

A spokesman for the National Governors' Conference said that, "Though the governors have not yet indicated that they are hopping mad about the current cutback, they certainly don't like it." ARBA director of public relations Randolph Russell said, "This particular one seems very unrealistic because only 15 states will have to bear the brunt of the cutback." He was referring to those States that had used their FY 1970 apportionment and had no carryover balance. Russell added, "If they feel it necessary to cut the program, at least let them do it so we can see what the hell is happening."

Senator Randolph sent a telegram to the President on July 8, reading in part:

> We continue to hear rumors of an impending cutback in the obligation of funds from the Highway Trust Fund in the magnitude of 20 to 25 per cent. This is personally and officially alarming to me for three reasons beyond those that have been advanced in former instances of executive impoundment of highway funds.
>
> 1. It is a breach of faith with the American tax-paying public.
> 2. With the present sag in the economy and increasing unemployment this is a most imprudent time to aggravate the problem by cutting back on highway construction, and
> 3. It is a clear violation of the intent of Section 15 of Public Law 90-495, Federal Highway Act of 1968 . . . ."

The latter point was a reference to the sense-of-Congress provision included in the 1968 Act. President Johnson and now President Nixon recognized that it was not a mandatory prohibition. As the article explained, the 1968 Act originally contained an amendment rather than a sense-of-Congress provision. "But it was watered down to a resolution because the Administration was so opposed," according to a House Public Works Committee staffer. Now, with the 1970 Act pending, committee leaders in the House and Senate were thinking about including a prohibition. ["Congress and White House Moving Toward Showdown on Highway Funds," *National Journal*, July 25, 1970]

The Federal-Aid Highway Act of 1970

In August, Senator Randolph released his version of the Federal-Aid Highway Act of 1970. The trucking industry newspaper *Transport Topics* began its coverage of the bill by going to the heart of the measure:

> The gathering drive to substitute "Transit" for "Trust" in the Highway Trust Fund gained new momentum last week with the introduction of the Federal-Aid Highway Act of 1970, which authorizes use of the Trust Fund for several projects not directly connected with highway construction.
>
> The bill . . . would allow Trust Fund money to be used for such things as replacement housing for people displaced by highway projects, highway beautification projects and support of bus—but not rail—public transportation systems . . . .

> His bill was introduced one week after the nation's governors voted to ask Congress for authorization to spend part of the Trust Fund money on other transportation systems.

Senator Tydings and Representative Bingham had introduced legislation that would have permitted the States to spend a portion of their funds on other transportation systems, as the Governors had proposed, but Representative Fallon was not supportive. He said, "I think it would be a rough road to transfer money from a fund created by highway users who are paying for highways they haven't even gotten yet." [Merrell, Jesse H., "New Federal Highway Bill Would Divert Trust Funds," *Transport Topics*, August 24, 1970]

The Randolph bill provided additional funds for the Interstate System through FY 1977, but also demonstrated a growing impatience for its completion. To get the States moving, the bill provided that segments not ready for construction by 1975 would remain on the System but would lose their eligibility for 90-10 Federal-State funding. The 90-percent Federal share would come to an end after the end of the program in 1977. Meeting that target would be easier because of expected savings from "some highly controversial and expensive sections of Interstate highways in urban areas" that would not be built.

The bill authorized $450 million a year to assist bus transit because "highways are not the exclusive domain for cars." Buses could help reduce congestion and the need for additional highway construction. Funding also could be used for construction of exclusive or preferential bus lanes and bus passenger loading areas and facilities.

Funding for replacement housing where it would not otherwise be available was necessary "to facilitate the start of work on highway segments so important that they can't wait for housing shortages to be corrected through normal channels." The Highway Trust Fund revenue also would support public lands and forest highway projects that previously were financed out of the general Treasury, highway traffic control devices, equal opportunity training and skill improvement programs, and reimbursement of additional costs resulting from implementation of environmental legislation.

In addition, the Randolph bill proposed to formalize urban highway spending by creating a Federal-aid urban system in urban areas of more than 50,000 population to supplement existing funding categories for extensions of the Federal-aid primary and secondary systems in urban areas. Further, Governors, on the recommendation of officials of urban areas with 50,000 population, could ask the Secretary to approve the use of highway funds for the operation of public transportation facilities, including purchase of equipment, reducing losses to facilitate service expansion, and continuation of service that would otherwise by reduced or abandoned. The funds could be used for private transit operations only if the funds would be administered by a political entity.

Highway beautification (control of outdoor advertising and junkyards) and safety programs were "closely related to safe, efficient highway operations," but had been underfunded by past bills. Under the new bill, Senator Randolph said, "both of these programs will have a reasonable assurance of continued financing that can produce results."

Randolph also proposed a revitalized planning process to consider not only all public works, but their social and environmental impacts.

The bill did not include a measure prohibiting Presidents from imposing cutbacks.

In introducing the bill on the Senate floor on August 18, Senator Randolph acknowledged that some of its provisions would be controversial. The resulting legislation, he said, would be "of more than routine importance." Over the course of 14 years of focusing on the Interstate System, "there have been many changes in public attitudes and in transportation requirements that must be given considerable weight in formulating national policy and writing highway legislation." He cited growing urban problems, a renewed emphasis on public transit, and concern about environmental quality.

While Congress was "morally committed" to completing the Interstate System, he said that "it is imperative that we begin now to lay the groundwork for highway programs for the post interstate period."

As for the Highway Trust Fund, he acknowledged testimony, as well as public commentary, on its future:

> I also detect a growing and unfortunate polarization between holders of differing viewpoints that could complicate the process of arriving at an equitable solution. There are those who accuse the so-called highway lobby of wanting to pave the country over with concrete. The other side maintains that their opponents are aiming for a complete halt in all highway construction.
>
> I have listened carefully and I have read carefully, and I am convinced that neither of these assessments is correct. Those individuals and organizations involved in roadbuilding recognize the need for support of other forms of transportation, and even the most ardent supporter of mass transit sees the necessity to continue improving highway facilities.

Some modes of transportation had been neglected, an issue Congress was addressing in several ways, including enactment of the Airport and Airways Trust Fund and development of urban mass transportation assistance legislation, then still pending in Congress. Development of a national passenger railroad system, also pending congressional action, was another possible need. "The highway trust fund is undoubtedly an attractive and appealing potential source of revenue to meet those needs." In response, his bill addressed highway-related transit activities that fit the purposes of the Highway Trust Fund. ["Introduction of the Federal-Aid Highway Act of 1970," *Congressional Record*, August 18, 1970, p. 29392-29393]

On September 2, Secretary Volpe announced a major new emphasis on moving people, rather than vehicles, on streets and freeways in urban areas. The FHWA, he said, was instructing its engineers in the 50 States to "encourage the greatest use of buses in preference to individual automobiles." The goal was to improve the productivity of urban highway systems as an example of expanded flexibility in the use of Highway Trust Fund revenues.

Administrator Turner's memorandum to field staff explained:

> It will not be financially possible—and even if it were, certainly not socially desirable—to provide all the highway facilities that would be needed in order to satisfy the peak period demands, especially in our larger urban areas, for all of the people who want to drive automobiles.

He cited an example of how counting people rather than vehicles would work:

> A vivid illustration of this occurred not too long ago. In evaluating the possibility of reserving a freeway lane for buses during the peak periods, the evaluator found that during the peak hour 67 percent of the vehicles were automobiles and less than 15 percent were buses. But when existing vehicle occupancy figures were introduced to enable the evaluation to be made on a <u>people</u> rather than <u>vehicle</u> moving basis, it was shown that during the peak hour only 15 percent of the people were in automobiles and over 82 percent of the people were in buses.

These figures reflected the fact that during peak periods, automobile occupancy was about 1.5 people per vehicles and that 70 percent of vehicles carried only the driver. "We can see that there certainly is a great deal of inefficiency from the automobile use side of the picture."

FHWA field staff were asked to encourage the State highway agencies to explore several methods of providing special treatment for buses as described in the announcement:

> <u>Exclusive Bus Highway</u> – an entire highway facility reserved at all times solely for the use of buses. (This category could be expanded to also include other vehicles such as car pools, FHWA noted.)
> <u>Exclusive Bus Lanes</u> – one or more lanes of a highway facility reserved solely for the use of buses, usually during peak periods. (This might also be expanded to include car pools.)
> <u>Preferential Bus Treatment</u> – making special allowance for bus movement within the general stream of mixed highway traffic, usually during peak periods (e.g., metering vehicle access to freeways with bypasses for buses, bus-actuated traffic signals, etc.).

FHWA also told its field staff that:

> . . . additional attention should be given to the movement of people as well as the movement of vehicles in future studies for the general determination of the number of lanes on high-volume radial highways, including freeways. Whenever there is reasonable expectation that there could be state-city-local coordination to establish special bus utilization of urban highways, detailed analyses should be made of exclusive bus lanes or preferential bus treatment alternates in the preliminary plans.

At the same time, bus companies must be willing to cooperate by providing additional buses:

> The decision by a State to implement any major urban highway improvements which include special bus usage will invariably involve decisions by others to upgrade the transit service elements to handle the additional ridership. The state should take the initiative in contacting local transit authority or operator [sic] and in jointly developing project plans for reserved bus forms of highway improvements on the basis that the transit authority or operator will undertake the associated service improvements.

Testifying before Senator Randolph's committee on September 9, Secretary Volpe praised numerous provisions of the Senator's bill, but indicated that the department was working on studies that would help it develop proposals in 1972 to address the changing urban transportation landscape. He expected to recommend what to do with controversial urban Interstate segments, the possibility of a single Transportation Trust Fund, and how to reshape the urban transportation planning process. He preferred that Congress, instead of adopting Randolph's innovations, simply extend the current program to allow the Administration to develop its proposals. He specifically opposed the use of revenue to subsidize transit operations. It was, he said, "the most costly and probably least effective way of curing the patient."

An editorial in the September 1970 issue of *Better Roads* said of Randolph's bill:

> It seems evident from the actions taken so far and from the mood of congress itself that things will not remain as they have been. If you want to bet on a sure thing, bet on that.

After summarizing the proposed new use of highway revenues, the editorial said:

> This broadened concept is not destined to be immediately and universally popular among all the dwellers in the halls of AASHO, but it would seem that in such areas as these that are so directly tied to highways and highway construction, there is small cause for outrage and outcry.

The use of highway funds for mass transportation was another matter:

> It stands out like a boil on a beauty queen's chin. If the concept of Highway Trust Fund financing is that it be used for highway purposes, it is difficult to see how some of the senator's proposals can be made to fit that definition . . . . If the federal-aid highway program were oversupplied with funds these proposals might be more readily acceptable. But the highway program is not over-funded and administration cutbacks in recent years have succeeded in stretching the program out and making it, in the end, considerably more costly . . . . Public transportation should have a healthy, viable program of its own. It should not have to lean, all orphaned and crippled, on the federal-aid highway program.

The editorial urged readers "not to get too hung up trying to keep things as they are." Change was inevitable, and extension of the program for a few more years would give "the deep thinkers on highway matters" time to develop "new and viable means of highway financing." One thing was clear:

> For in truth the Highway Trust Fund has become a symbol of all that is bad in the highway program as far as highway critics are concerned. It will continue to be the target of their barbs; its demise will continue to be the goal of their concerted and growing effort . . . . The urgent need is for new thinking, for innovation. ["Highway Financing May Need Some New Ideas," *Better Roads*, September 1970, p. 8-9]

On Friday, October 2, the Senate approved the Federal-Aid Highway Act of 1970 after rejecting the provision for subsidizing public transit operations. As an alternative, the Senate approved an amendment calling on the Secretary of Transportation to study how to fund other forms of transportation. The final vote on the bill was 51 to 0, with other Senators not present or voting.

The Senate bill authorized $12 billion for Interstate Construction through FY 1976. In addition to $1.050 billion a year for the Federal-aid primary and secondary systems and their urban extensions, the bill created and funded the Federal-aid urban system ($375 million for FY 1972, $450 million for FY 1973). It authorized $450 million for the bridge replacement program as well as funding for safety, highway beautification, and roads on public lands out of the Highway Trust Fund. The Senate did not include tax measures, which under the Constitution had to originate in the House.

The bill changed the statutory definition of "construction" to cover "economic, social, environmental and other impacts," thus making impact mitigation eligible for Federal-aid funds. It also strengthened public hearing requirements and required the Secretary to issue guidelines for avoiding, minimizing, or overcoming possible adverse impacts. The definition of "construction" also was expanded to include exclusive or preferential bus lanes, highway traffic control devices, bus passenger loading areas and facilities, such as shelters, bus terminals, bus storage, and parking areas and facilities. The Senate also required an analysis of the relationship of highway construction and funding to transportation services using the highway.

On October 8, 1970, Senator Kennedy introduced S. 4451, a bill to establish a National Transportation Trust Fund that would terminate the Highway Trust Fund and the Airports and Airways Trust Fund and absorb the revenue, along with revenue from the excise tax on the sale of new automobiles, in a "more comprehensive fund." The state of transportation today, he said in prepared remarks, "is an absolute mess." The "essential problem" was that "programs have developed separately for the different modes of transportation." This "outmoded Federal policy of categorical programs has denied the badly needed flexibility in transportation policy." As a result, "a disproportionate amount of resources" went to highways and "not enough" to mass transit:

> States and cities often face the possibility of either obtaining money for highway construction or getting no money at all. So they are building highways when their needs may really be for other transportation facilities.

Senator Kennedy said he had been working with Representative Koch who had introduced a similar bill in July. The National Transportation Trust Fund would go into effect on July 1, 1972, the same day the existing funds would be terminated.

Senator Kennedy recognized that the Office of the Budget and Department of Transportation objected to the trust fund concept because it took funding decisions away from the Administration and the Congress. His bill addressed this objection by "preserving to the President and Congress in the annual budget process the determination of the total amounts to be budgeted for expenditure from the trust fund." It also required a Presidential review of expenditures every 3 to 5 years and directed that a surplus over a certain amount would be returned to the general Treasury.

He said that the bill's most important provision was one that encouraged regions, States, and metropolitan areas with populations of 50,000 or more "to prepare and maintain comprehensive transportation plans." No State would receive funds "unless it has in existence a comprehensive State transportation plan which has been approved by the Governor and by the State legislature and which includes comprehensive plans for transportation in each metropolitan area of 50,000 or more."

He knew that at this late date in the congressional session, "there will not be time for hearings or action this year." He hoped, however, that introducing the bill now would "set the stage for prompt action next session." For now, the bill was referred to the Committee on Banking and Currency, which took no action on it. [*S. 4451—Introduction of a Bill to Establish a National Transportation Trust Fund*, Congressional Record-Senate, October 8, 1970, p. 35744-35745]

Action in the House

Action shifted to the House, which did not yet have a bill ready for floor consideration. Chairmen Fallon and Kluczynski had introduced an initial bill on April 7, 1970. H.R. 16788 was a stripped down bill covering mainly the basics for extending the Federal-aid highway program.

On April 21, the first day of hearings by the Subcommittee on Roads, Representative Ryan was one of the witnesses. His focus was on urban transportation:

> In an age when man can travel to the moon, he has difficulty getting from one place to another here on earth—especially within a metropolitan area. Traffic creeps at a snail's pace, or the transportation is so severely inadequate that it just cannot move commuters.

He favored "a balanced transportation policy." As the number of vehicles increased, they were "making our Interstate Highway System virtually interstate parking lots." At the same time, "Highways are useless to those who cannot or do not own a car." The poor, the elderly, and the handicapped who could not afford a taxi "have no access to transportation systems." In "our urban ghetto, where transportation is usually worse," those without a car could not get to jobs.

In response, he said, he had introduced H.R. 628 to require at least 30 days notice "before any public hearing is held involving plans for a Federal-aid or State section of an interstate highway project." The hearing would have to be held within 1 year of the date when the plans would be submitted to the Secretary for approval. The State highway agency would have to certify that it had considered the economic and social effects of the proposal and submit a report on its economic and social effects, including the effects on tenants and owners of all property to be acquired.

He added:

> Since Congress has in no way illustrated its commitment to mass transit programs by appropriating adequate levels of funds, I have been introducing legislation for many years which would allow a State to elect to use its highway construction allocation for mass transit.
>
> Since the highway trust funds are allocated to the States, H.R. 48 gives the Governors the power to decide whether or not highway trust fund money should be used for mass transit . . . .
>
> Congress has refused, in the past, to debate my proposal to use highway funds for mass transit. Each year, since 1966, I have offered this proposal in amendment form to pertinent legislation on the floor.

He recited the paradox of the amendment not being germane to highway or transit bills, then continued:

> Certainly, Members of Congress cannot continue to ignore our national transportation crisis through parliamentary maneuvering. I think, if nothing else, we owe our constituents a debate on the issue. Even more than debate, we owe them action.

Chairman Kluczynski responded that while he supported Federal assistance for mass transit, "I do not believe it should be funded from the highway trust fund," but a trust fund of its own. He had been disappointed that the Administration did not support a Mass Transit Trust Fund, but "I hope you will be able to urge full debate, a separate trust fund, when the mass transit [bill] comes up before the House."

He added, "There is an old saying in this committee called where is the money coming from?" Under Chairman Fallon, "who is the father of the Interstate Highway System," the Federal-Aid Highway Act of 1956 provided the funds for a 41,000-mile network at a cost of $27 billion. Now, the Federal-Aid Highway Act of 1968 added 1,500 miles making "it 42,500 at a cost of over $65 billion." He continued:

> We have to complete this system. We thought the target date was 1972, and we are up as far as 1974 or 1975 now. We all agree with you, and I would like to help you in your fight on mass transit, because we need it in big cities like Chicago and other big cities, but the thing is can you get your own trust fund? Where is the money going to come from?
>
> Can we tax the people any more? They are taxed up to their ears now, and we do not even want to increase the gasoline tax, if possible.

He called on Chairman Fallon to address the jurisdiction issue. He said:

> As the gentleman knows, the legislation for mass transit comes under a different committee than this committee. We have nothing to do with mass transit. The only mass transit that we might have anything to do with would be related to the highways, and that would probably be highways for buses. But the point I want to bring out is when you are talking about using the trust fund money for other purposes, it is stated in the law it cannot be used for any other purpose except for the construction and building of highways.

He summarized how the Clay Committee's proposal for issuing bonds to pay for the Interstate System had failed in 1955. Chairman Fallon explained that his pay-as-you-go plan also failed in 1955, but with the addition of the Highway Trust Fund, it succeeded in 1956:

> We have committed the users of the highways that they are paying for it, we are going to build the highways for them with this money. Other people, ever since the trust fund got a little bit healthy one time, people started looking at it to finance other projects. And this committee cannot, I can say in good conscience, devote any money other than for highway purposes because the people using them are being charged for them. If they had been built by a bond issue where everybody paid by contribution [as the Eisenhower Administration had proposed], then you would be open for most any other suggestion for this money to be used for other purposes. But not under the conditions which were accepted by the Congress and people of this country can we change the law at this time.

Representative Ryan suggested that since the Highway Trust Fund would expire after 1972, the terms of the commitment with contributors could change. Representative Fallon responded:

> You have to get the users who pay the taxes to agree that they will be used for other purposes than what he is paying for now. I doubt very much if you would be able to get that, because we had a pretty tough time getting it through when we were going to spend every dime on the roads to build highways for users. We have had a tough time getting it through because it was defeated at one time, and we came back the second time because they realized this job was a necessary job, had to be done, and the articles that appeared when the bill was killed on the floor—the articles that appeared in the obituary column, if we had had those before the bill went to the floor, we would have passed it the first time.

He was referring to the defeat of his initial pay-as-you-go bill in August 1955, killed by highway interests, particularly truckers, who did not want to pay additional taxes for the Interstate System. With the addition of the Highway Trust Fund concept and agreement with the interests on tax increases that would benefit them many times over, Representatives Fallon and Boggs, along with Senator Gore, secured passage in 1956.

Representative Ryan said, "I am sure the distinguished chairman is so persuasive that if he went on the floor and argued for this bill, it would pass." Chairman Fallon replied, "I am not so sure about that." Chairman Kluczynski thanked Representative Ryan for appearing before the committee and assured him that, "there is no member on this committee who would not be for mass transit if we can have a separate trust fund."

Ryan concluded that, "we must recognize that the problem is not simply rapid transit; the problem is not simply airways; what we need is a balanced transportation policy in this country, and what we need is to have the ability to finance all stages of it." Instead of compartmentalizing modes, "we should have one overall way to finance transportation." In addition to H.R. 48, he was a cosponsor, although with Chairman Kluczynski, of a bill to establish a Mass Transit Trust Fund. He was not sure that was the solution, but in view of the jurisdiction issue, he also had sponsored a bill to create an Urban Affairs Committee in the House. [*Federal-Aid Highway Act-1970*, Hearings Before the Subcommittee on Roads of the Committee on Public Works, House of Representatives, 91st Congress, 2nd Session, U.S. Government Printing Office (91-35), p. 17-26]

On May 7, Helen Leavitt, author of *Superhighway-Superhoax*, testified. Although suffering from the flu and a slightly high temperature, she said "I would like to address myself to the philosophy of your most sacred cow, the highway trust fund." As for what the subcommittee called "the world's largest public works project," she pointed out what the country had received in return for its $46.1 billion investment:

> First of all, we now have a totally auto-dominant transportation system.
> Second, we have acres and acres of urban blight where super-highways have been constructed in metropolitan areas.
> Third, we have the foulest air, the major cause of which is the automobile.
> Fourth, we have prosperous oil, rubber, automobile, insurance, and construction industries.
> And why not? They receive a huge subsidy from the very existence of the trust fund.
> But most of all, what we have received from the trust fund is a clear demonstration of the need for a transportation system that works when we need it.
> That we do not have now and the transportation system created and perpetuated by the highway trust fund will never provide it.

The Highway Trust Fund "provides the relief to the auto highway construction industry much as heroin relieves the addict, whose insatiable need reappears when the effects of his 'fix' are expended, to demand ever more of the same in a never ending quest for–what? In this case, more tax dollars for more highways." It was "an eternal light" bringing us "auto congestion, smog, deaths, blight, General Motors, Ford Motor Co., U.S. Rubber and others, in perpetuity."

Instead of extending the Highway Trust Fund, the subcommittee should "abolish it in its present form." She opposed a Mass Transit Trust Fund because with the exception of the Social Security Trust Fund, trust funds were "bad government." She added, "We no more need a proliferation of mole-like holes leading to subways in our cities than we need superhighways in the urban skyline."

When Leavitt finished her brief statement, Chairman Kluczynski's thanked her and added, "I assure you a closed mouth catches no flies." Only Representative Harsha had questions for her. He noted that in her book, she had mentioned his law firm, but got the name wrong. Also, he objected to her characterization of the firm as representing Greyhound Bus Lines, since it represented the company only in one case. She promised to check and makes corrections in subsequent editions if needed.

He asked if she drove an automobile. "Yes, occasionally," she answered. He replied, "Then you contribute to all this pollution you are complaining about." She said she drove it as "little as possible."

Representative Harsha also questioned her objection to trust funds, including one for mass transit. She said she favored mass transportation, but "I have found that planning follows funding and my fear is with mass transportation funds, we are going to have a proliferation of mass transit systems which might not be justified at all . . . ."

He also wanted to know who supported her study of highways. At first, she was confused by the question, responding only that her husband supported it. When he clarified that he meant foundations or other organized groups, she replied that the only financial support she had received was an advance of $2,000 from her publisher. She had worked on the book for 2 and a half years:

> Mr. Harsha. No other funds went into this study?
> Mrs. Leavitt. Absolutely not.

After a brief exchange about highway deaths, Harsha asked, "Well, taking your suggestion to maybe the ridiculous point, if we did away with all highways, we would not have any accidents?" After Leavitt agreed that "we would not have any automobile accidents," Harsha told the chairman, "Okay, that is all I have."

Chairman Kluczynski admitted he didn't have a copy of her book, but planned to get a copy and "read part of it anyway." In the transcript, his concluding comments, like his earlier brief comments, had a patronizing tone. He said he admired her "courage, fighting spirit," and thanked her for appearing. [*Federal-Aid Highway Act-1970*, p. 411-416]

On June 9, Secretary Volpe appeared before the subcommittee. He began by pointing out that calling the Interstate System the "greatest public works project in the history of mankind" did not indicate whether it was good or bad. He had no doubt that the program "has been highly beneficial and a very good thing for the American people." He listed the benefits to economic development, accommodating growth in the number of automobiles, and safety.

He also acknowledged that automobiles worsened air pollution and that highways raised other environmental concerns while the urban segments were disruptive. At the same time, he noted that the urban segments were "a very small percentage" of the Interstate System and as for the environmental objections, "much of the scientific knowledge on which it is based is relatively new."

With that background, the problem of balanced transportation could be summed up as "not how much we have spent on highways in the past, but how very little we have spent on public transportation." Only recently had the public realized how much transit was needed, a problem the Administration's $10 billion program was intended to address. He hoped the House would approve the measure soon.

"The administration," he said, "is firmly committed to finishing the Interstate System," but he added the qualification "virtually." Some small segments might not be completed but the rest of the System would be finished in 7 to 8 years. The proposal by the Administration, which he was releasing, recommended some scaling down in authorizations, but a slight increase for the Interstate System. The decreases were intended to "maintain a steady progress in meeting our transportation needs within the framework of a sound national budget."

Under the Administration's proposal, all highway and highway-related programs would be funded from the Highway Trust Fund. These included highway beautification, public lands highways, and safety programs and research. "Each of these programs is for the direct benefit of the highway user and, therefore, we believe properly fundable from the Trust Fund."

Secretary Volpe added that the Administration bill "represents a careful attempt to improve the administration of certain existing programs consistent with orderly planning and construction, total transportation needs, and national budgetary priorities." The Department was working on the 1972 Highway Needs Study, which would be a "transportation" needs study, not just a highway needs study. It would provide the basis for a statement of national transportation policy that he would present to Congress in 1972 "for the development of a truly intermodal transportation program." [*Federal-Aid Highway Act-1970*, p. 946-954]

Writer John Burby, who had been an assistant to Secretary Boyd, wrote that Volpe had "delivered an endorsement of the Trust Fund so weak as to be virtually no endorsement at all." Much of his presentation had been devoted to safety and beautification, as well as support for mass transit funding. He had even questioned whether the entire Interstate System would be built, indicated the Department wanted to scale down the funding for Interstate Construction, and asked Congress to extend the Highway Trust Fund only for 5 years:

> What Secretary Volpe did not tell the committee was that he had been forced to spend weeks arguing with Presidential budget specialists to get approval of as much as a five-year extension. The White House staff originally wanted to go for no more than a two-year extension and even that extension was meant chiefly to buy them time for deciding whether to make a run for abolition of the Trust Fund. [Burby, John, *The Great American Motion Sickness or Why You Can't Get There from Here*, Little, Brown and Company, 1971, p. 312-313]

The final witness, testifying on June 11, was Terrence Wendell on behalf of Citizens for Sensible Transportation, an ad hoc Maryland group formed in 1970 to fight the "threat posed to their neighborhoods and parks by urban freeways." The group opposed the District's North Central Freeway (I-70S) and its extensions into Maryland and favored alternatives such as exclusive bus lanes, fringe parking, and rail commuter lines pending construction of the Metro subway.

FHWA's recommendations for increased urban road construction were based "on nebulous grounds" and showed "singular short-sightedness and lack of imagination." Perhaps, he suggested, FHWA could be forgiven for these assumptions since they are based on continuation of the Highway Trust Fund as the exclusive preserve of highway interests. He endorsed Representative

Ryan's proposal and asked the subcommittee to "give careful consideration to extending the limitations on highway trust fund expenditures to allow application to any transportation purpose, at least in metropolitan areas . . . where transportation problems are especially difficult and freeways are not necessarily the best solution."

During Wendell's testimony, Representative William Jennings Bryan Dorn (D-SC) was chairing the hearing. He asked the only other subcommittee member on the panel, "Any questions?" Representative Robert E. McEwen (R-NY) had none. Dorn said, "I want to thank you, Mr. Wendell." Wendell thanked the acting chairman for allowing him to speak. Dorn replied, "I just regret it had to be so late, but thank you very much." The subcommittee adjourned at 5:15 p.m. after compiling 1,126 pages of testimony and another 60 pages of papers and documents. [*Federal-Aid Highway Act-1970*, p. 1123-1126]

The Subcommittee completed work on its bill in mid-September. By the end of the month, the Committee on Public Works had approved its bill and added language provided by Chairman Mills of the Ways and Means Committee extending the Highway Trust Fund through FY 1978. The final committee bill authorized $4 billion a year for Interstate Construction through FY 1977, plus $3.5 billion for the final year. It authorized $1.1 billion a year for FYs 1972 and 1973 for the Federal-aid primary and secondary systems and their urban extensions, as well as $200 million a year for the new urban system. Funding for public lands highways would continue to come from the general Treasury, not the Highway Trust Fund. The Federal-State matching share for non-Interstate projects would be 50-50 until FY 1974, when the Federal share for non-Interstate projects would increase to 70 percent.

Looking to the post-Interstate era, the bill directed the Secretary of Transportation to submit recommendations by January 1972 for the functional realignment of the Federal-aid systems, including the new Federal-aid urban system. (Functional realignment is an assessment to determine the function of each public road. Those whose function met the criteria for the Federal-aid primary, secondary, and urban systems would be included. Periodic realignment allowed for changes in the systems as road functions evolved.)

The House bill permitted Federal-aid for exclusive or preferential bus lanes, highway traffic control devices, and bus passenger loading areas and facilities, including shelters and fringe and transportation corridor parking facilities. Eligibility would be dependent on a finding by the Secretary that the project would avoid construction of a highway project that would increase automobile traffic capacity, provide equal capacity to what would have been provided by the highway project, will not exceed the Federal share, and that no feasible or prudent highway project would provide the needed capacity.

The bill included the sense of Congress provision opposing impoundment of Federal-aid funds. It also prohibited the expenditure of Highway Trust Fund revenues for any Federal Department, agency, or instrumentality other than FHWA. In its report, the committee explained:

> Cutbacks and freezes on the availability of highway trust fund money have been invoked by the executive branch on various occasions during the past few years, allegedly as an anti-

> inflationary measure, even though funds were and are available in the trust fund to meet expenditures resulting from the obligation of such funds. This curb-against-inflation argument is without merit. The resulting delays in construction inevitably mean that the costs will be greater. This stop-start manipulation of the highway program, with the uncertain position into which contractors, laborers, and State highway programmers are put, cannot but help to boost the ultimate cost of the program . . . .
>
> The withholding of highway trust funds as an anti-inflationary measure is a clear violation of the intent of the Congress as expressed in section 15 of the Federal-Aid Highway Act of 1968. We again wish to emphasize the clear legislative intent that funds apportioned shall not be impounded or withheld from obligation . . . .

Other provisions included:

- Allowed the use of Highway Trust Fund revenues to replace homes demolished for roads if no replacement housing was available.
- Authorized the Secretary, on December 31, 1973, to remove from designation any segment of the Interstate System that did not have a construction schedule within the period of fund availability and with respect to which the State had not provided assurances to the Secretary that such a schedule will be met.
- Authorized funding for control of outdoor advertising and junkyards, but established a 13-member bipartisan commission to make recommendations to Congress on billboards and junkyards.
- Required the States to use no less than 5 percent, nor more than 10 percent, of their apportionments to rebuild or replace obsolete bridges that cross waterways on the Federal-aid primary and secondary systems if the existing bridge is unsafe because of structural deficiency, physical deterioration, or functional obsolescence.
- Authorized funds for high-hazard locations, elimination of railroad-highway grade hazards, and for highways to aid development of "economic growth centers" in rural areas.
- Recognized the administrative reorganization of FHWA, which occurred on March 22, 1970, and provided the statutory authority to convert FHWA's National Highway Safety Bureau into the National Highway Traffic Safety Administration (NHTSA).

On November 25, the House considered the bill under a decision by the House Rules Committee that allowed unlimited amendments to the highway portion of the bill, but no amendments to the tax portion of the bill drafted by the Ways and Means Committee. Nevertheless, when Chairman Mills presented his committee's portion of the bill, he had to address several amendments involving the use of Highway Trust Fund revenues.

After Mills explained the need to extend the Highway Trust Fund to September 30, 1977, Representative Bingham rose to question the need for such a lengthy extension. He pointed out that the fund had grown from $1.4 billion in 1956 to $5.2 billion now, with continued growth likely. Was it wise, he asked, "to lock up, so to speak, this source of very substantial revenue for many years ahead without regard to the consideration of other needs that might in these years be more urgent than the need for additional highway construction?" He had in mind the needs of the Nation's mass transit systems.

Representative Mills explained that the Highway Trust Fund was not taking in enough money to complete the Interstate System and address other road needs. The revenue will be needed for this one purpose, he said, adding that he understood the mass transit problem and had spoken with Secretary Volpe many times about how to develop a funding program for it:

> I know the legislation presently on the books calls for it to be financed from the general funds of the Treasury. However, I am not an advocate, and I want my friend to understand that completely, of using highway user tax funds for some other purpose than the construction of highways. I do not mean to say to my friend that there may not be some other way to set up a trust fund that could be used for the purpose of answering the problems of mass transportation, but I cannot see the relationship between taxing a person for highway use and the construction with his dollars of something other than a road.

He asked Bingham "if there is any relationship whatsoever between taxing a person who owns an automobile and who will gladly pay the tax for Federal roads, also of the development of mass transportation which he may never see? [sic]" Bingham replied that "improved mass transit can make life much better for the motorist on the highways, rather than having constantly increased congestion on the highways."

Representative Koch, who was blocked by the Rules Committee decision from introducing an amendment containing his bill to create a transportation trust fund, took up Representative Mills' challenge by pointing out that "transportation is an integrated matter, that the user of an automobile is at some time during the day a pedestrian" and may be "delighted when public transportation is available." Mills responded, "Then, assess a tax on them for mass transportation."

Koch responded, "I believe that the user of a motor vehicle would be willing to pay for the integrated system if you would give him a chance to do so." Mills told him, "I am sure you can almost sell me without any difficulty, but do not continue to ask us to tax for one purpose all of our people and then say, 'No, no. We are going to use it for some entirely different purpose.' Let us tax them on the basis of that which we want to improve." The dialogue continued:

> Mr. Koch. What we need is a single transportation trust fund, from which localities can choose that kind of transportation most needed and suitable in their area. It is wrong to impose highways on the city of New York where they need mass transit.
> Mr. Mills. I am perfectly willing to consider the entire problem, but I am not willing to finance the entire problem out of the users of one segment of the problem. That is all I'm saying.
> Mr. Koch. We say put all of these special taxes into one fund.
> Mr. Mills. That is what I am telling you. I will be glad to hear you at any time you want to be heard after the 1st of January. You develop a program of user taxes that is related to the use of mass transportation and I will be glad to hear you.

> Mr. Koch. I will be down to talk to you. [*Congressional Digest—House*, November 25, 1970, p. 38955-38957]

During a later discussion, Representative Bingham said that based on the House bill, the inescapable conclusion was that "this Nation is—and for the indefinite future will be—fiddling with freeways while our cities burn." He asked, "is there to be no pause, no review, no reevaluation" of the 1956 commitment?" The Nation could "no longer tolerate this squandering" of the funds, and for those who spoke of the commitment made in 1956, he said surely that promise had been fulfilled.

He said he would offer amendments at the appropriate time to limit the extension of the Highway Trust Fund to 1976 and to establish a Transportation Trust Fund. "If my amendments are defeated, as I fear they will be, I shall vote against this bill and urge others to do likewise." [*Congressional Digest—House*, November 25, 1970, p. 38961]

Near the end of a parliamentary dispute about a provision concerning freeway construction in the District of Columbia, Representative Bingham introduced his amendment to open the Highway Trust Fund to mass transit projects. When the dispute ended, the clerk read his amendment into the record. Representative Fallon tried to raise a point of order, but he was informed that he was too late. Allowed to proceed, Representative Bingham explained that his amendment would simply expand the provision in the bill that extended Federal-aid to highway-related mass transit:

> It has been suggested that using highway fund moneys for mass transit is not proper use of the excise taxes involved but if it is proper for bus mass transit, why not for rail mass transit?

He pointed out that the purpose of the excise taxes was to improve highway transportation. "The needs of our highways in New York would be vastly better met by improving our mass transit facilities in New York." He continued:

> This would not be in any sense a departure from a commitment we have made to any taxpayers, because this is a new bill creating the extension of a tax. It is not dependent on any commitment made in 1956. It is a new bill. It is a new era. It is an era when we should have a balanced transportation system, and this amendment would make it possible for us to have a balanced transportation system.

Representative Kluczynski briefly stated that he opposed the amendment. Representative Fallon pointed out that the same amendment had been introduced in 1968 and ruled out of order. However, Representative Harsha provided a longer rebuttal. The clear purpose of the amendment, he said, was "to open up the trust fund to the construction of mass transportation, rail transportation, and even water and air transportation." This would be "contrary to the 1956 Highway Revenue Act and will delete [sic] the trust fund so that we will not be able to complete any of the highway systems that are needed in this country." Opening the Highway Trust Fund to any form of mass transportation would mean "we certainly will never be able to conclude a viable and effective highway program."

Representative Koch admitted that those offering such amendments did not "expect to win on any of the proposals." All they were trying to do "in a rational way" was to alert the Members to "the real need for a comprehensive approach to our transportation requirements, as well as the need for more money for mass transit." He continued:

> We recognize there is a need for highways. We are not the enemies of highways, although there are particular highways to which we object.
>
> What we are saying is: You have an interest in the total transportation picture . . . . Members of this House are not acting against the interests of their automobile-driving constituents when they attempt to appropriate sums for mass transit. They are helping these constituents.
>
> Is there anything wrong with saying that where a highway is appropriate we would build a highway and where a mass transit facility—a subway, a bus, or an elevated structure—is appropriate, that is what we would build?

If a Governor decides that mass transit would be more efficient than a proposed highway, "why should the Federal Government refuse to fund anything other than a highway?" He continued:

> This is why I have proposed that we establish a single transportation trust fund combining the mass transit, highway, railroad, and airport programs. If all transportation funds were dispensed from a single source, we would then be in a position to effect the rational, integrated approach desired and weigh the priorities and efficiency of one form of transportation against another. [*Congressional Digest—House*, November 25, 1970, p. 38990-38992]

After a few other Representatives spoke briefly in support of the Bingham amendment, Representative Kluczynski moved to cut off debate. Moments later, the amendment was rejected by voice vote.

Later that day, the House approved the $22 billion bill by voice vote after 3 hours of debate. The House and Senate bills had many similarities, but differences would have to be reconciled by a Conference Committee.

The committee completed its work on December 17. The House took up the measure on Friday, December 18. It was basically routine business by this point, but Representative Bingham took the opportunity to note that the final version of the bill extended authorizations for the Interstate System only through FY 1976, as he had proposed. The House approved the bill, 319 to 11, the same day. The Senate approved the bill on December 19.

President Nixon signed the bill on December 31, 1970, without formal comment. Secretary Volpe agreed with many observers who considered it the most significant highway legislation since the Federal-Aid Highway Act of 1956. He praised its extension of the Highway Trust Fund, the assurance it provided that the 42,500-mile Interstate System would be completed within the decade, and extension of the Highway Trust Fund revenue to "the very important areas of highway safety and access roads to national forests and public lands." He added, "It gives the Department of Transportation and the Federal Highway Administration many of the tools we need to tackle the growing social challenges of our nation, especially in our urban centers."

Some provisions of the Federal-Aid Highway Act of 1970 were:

- Adopted the Senate extension of the time for Interstate completion through FY 1976, with authorization levels for the purpose.
- Accepted the House authorization levels, including for the new urban system, with some exceptions, including specifying that the source of authorizations for Forest Highways and Public Lands Highways would be the Highway Trust Fund, but restricted the funds to segments on a Federal-aid system.
- Retained the sense of Congress provision on expenditures by agencies other than FHWA if such expenditures are specified by statute, but expanded it to add that the expenditures also had to be authorized to be appropriated from the Highway Trust Fund by Federal-aid highway legislation.
- Increased the Federal share to 70 percent beginning in FY 1974 for non-Interstate projects.
- Accepted the House provision on urban highway mass transportation with minor changes related to fringe and corridor parking facilities.
- Included the House provision on construction of replacement housing as a project expense when no replacement housing is available and cannot otherwise be made available.
- Called for a highway needs study to be submitted in January 1972, including functional realignment.
- Authorized the Secretary to remove from designation any segment of the Interstate System for which the State had not established a construction schedule by July 1, 1973, or assurances that construction will be completed within the period of availability of funds for the purpose. If the State has not submitted plans, specifications, and estimates (the bidding documents) for approval by July 1, 1975, the Secretary was to remove Interstate designation. Alternative segments could be designated in the same urban areas.
- To a large extent, the bill reflected the Senate provisions on public hearings and economic, social, environmental, and other impacts.
- The States could ask the Secretary to designate as future parts of the Interstate System any Federal-aid primary highway if it meets the definition of an Interstate highway or the State agrees to upgrade it to full standards in 12 years. These routes would not be eligible for Interstate Construction funding.
- Established a Commission on Highway Beautification to study existing requirements on outdoor advertising and junkyards, review Federal and State administrative policies and practices, compile data necessary to understand requirements that may or are likely to exist for control, study problems involved in outdoor advertising, review methods of financing to carry out the beautification program, and recommend changes in laws, regulations, policies, practices, and demonstration programs to "achieve a workable and effective highway beautification program and best serve the public interest."

- Adopted the Senate provision on funding for replacement of bridges over waterways, limiting the funds to bridges that are unsafe because of structural deficiencies, physical deterioration, or functional obsolescence. It also required FHWA to develop a national priority inventory to be based on serviceability, safety, and essentiality for public use.
- Provided statutory authority for the March 1970 creation of NHTSA.

That same day, President Nixon approved another bill that would have a major impact on future debates about the Federal-aid highway program, the use of motor vehicles, and diversion of Highway Trust Fund revenues to alternative transportation modes.

Cleaning the Air

Concern about the quality of air over America's cities had been developing throughout the 20th century. The concern focused on the smoke-belching factories that were the economic backbone of the country's large cities. Initially, the smoke clouding the sky was viewed as an aesthetic problem to be dealt with city-by-city, not as a health issue of statewide or national concern. However, attitudes began to change when smog over Los Angeles in the 1940's limited visibility and caused medical problems such as nausea and respiratory difficulties. California became the first State to enact an air pollution law in 1947.

A series of incidents focused attention on the health implications of air pollution, especially during a temperature inversion (an increase in temperature at higher levels trapping smog at the lower levels). In October 1948, a temperature inversion occurred over Donora, Pennsylvania, trapping high concentrations of sulfur dioxide released by the American Steel and Wire plant and Donora Zinc Works, leading to 20 deaths and respiratory and other complaints from many residents. A 1950 incident in Poza Rica, Mexico, in which 22 people died and over 300 were hospitalized was followed by the "London Fog" in December 1952, when a 5-day temperature inversion beginning December 5 trapped acid aerosols in the atmosphere, killing 4,000 and disrupting life throughout the area.

The Federal Government became involved with enactment of the Air Pollution Control Act of 1955 (P.L. 84-159) on July 14, 1955. The Act, and extensions in 1960 and 1962, authorized funds for the Public Health Service to research and provide technical assistance on the health and welfare effects of air pollution. The 1962 extension called on the U.S. Surgeon General to determine the health implications of motor vehicle emissions.

The Clean Air Act of 1963 (P.L. 88-206) authorized a 3-year funding program under the Department of Health, Education, and Welfare to help State and local governments research and combat air pollution. The Act also encouraged development of emissions standards for motor vehicles and stationary sources, such as factories. The Motor Vehicle Air Pollution Control Act of 1965 (P.L. 89-272) called on the Secretary of Health, Education, and Welfare to establish emission standards on light-duty motor vehicles (reduction of hydrocarbons (72 percent), carbon monoxide (56 percent), and crankcase hydrocarbons (100 percent)). It also established the National Air Pollution Control Administration (NAPCA) in the Department to take responsibility for future pollution control efforts.

The national standards, modeled after California's 1966 standards, went into effect for all 1968 models. California had been using economic power based on the number of vehicles its residents purchased to force the auto industry to include emissions control devices on new cars sold in the State, but the results were of limited value.

In February 1970, President Nixon had called for action by Congress to strengthen clean air legislation. The result was the Clean Air Amendments (CAA) of 1970, which the President signed on December 31, 1970. He held a signing ceremony in the White House's Roosevelt Room, which he considered appropriate because, although the room was named for Presidents Theodore Roosevelt and Franklin D. Roosevelt, the first President Roosevelt had been "the man most remembered in American history for his interest in conservation, his interest in the environment."

He recalled his statement a year earlier when he signed NEPA on January 1, 1970:

> I said that this would be the year of the environment, that it was now or never if we were to clean up the air and clean up the water in major parts of the United States and to provide the open spaces that are so important for the future generations in the country.

A year later, he said, he was about to sign "the most important piece of legislation, in my opinion, dealing with the problem of clean air that we have this year and the most important in our history." He credited a bipartisan effort in Congress for completing the legislation.

President Nixon considered 1970 the year "in which we really began to move on the problems of clean air and clean water and open spaces for the future generations of America. If completely enforced, he said, the legislation would result in a 90-percent reduction of polluting emissions from automobiles in 4 years:

> And the problem of automobile pollution, as we know, is one that not only now plagues my native area of southern California but all the great cities of this Nation, particularly those which have heavy automobile traffic, and most of the great cities of the world have similar problems.

He concluded:

> And if, as we sign this bill in this room, we can look back and say, in the Roosevelt Room on the last day of 1970, we signed a historic piece of legislation that put us far down the road toward a goal that Theodore Roosevelt, 70 years ago, spoke eloquently about: a goal of clean air, clean water, and open spaces for the future generations of America.

More a rewrite than an amendment of previous legislation, the 1970 CAA was intended "to protect and enhance the quality of the Nation's air resources so as to promote public health and welfare and the productive capacity of its population."

(The White House had not initially planned to invite lawmakers to the ceremony, which was to take place before only reporters and cameras. When Senator Randolph heard about the plan, he suggested the White House share the credit. As a result several Members of Congress participated in the ceremony with only 2 hours notice. Senator Edmund S. Muskie (D-Me.) was not invited even though he was the chief sponsor of the legislation and had significantly strengthened the Administration's proposal. Despite speculation that he had not been invited because he was a leading contender for the Democratic Party's presidential nomination in 1972 (his staff called the incident "small town politics"), the White House maintained his exclusion was simply normal business since he was not the chairman of a committee, but only of a subcommittee. [Oberdorfer, Don, "Muskie Not Invited to Air Law Signing," *The Washington Post*, January 1, 1971]

Just a few weeks before President Nixon approved the 1970 CAA, the Environmental Protection Agency (EPA) had opened for business on December 2, 1970. It combined agencies, including NAPCA, and responsibilities from other Departments into an independent agency. Creation of EPA reflected the growing understanding of the relationship between human activities and the environment that had been spurred by publication of Rachel Carson's *Silent Spring* in September 1962. The book, which explained how chemicals were altering nature, helped build public awareness of the effects of human activities on the environment. Prior to *Silent Spring*, conservationists sought to preserve as much of nature as they could. After *Silent Spring*, the "conservation" movement quickly became the "environmental" movement to minimize harm by human actions.

In a press release on December 16, the first EPA Administrator, William D. Ruckelshaus, said:

> EPA is an independent agency. It has no obligation to promote agriculture or commerce; only the critical obligation to protect and enhance the environment. It does not have a narrow charter to deal with only one aspect of a deteriorating environment; rather it has a broad responsibility for research, standard-setting, monitoring and enforcement with regard to five environmental hazards; air and water pollution, solid waste disposal, radiation, and pesticides. EPA represents a coordinated approach to each of these problems, guaranteeing that as we deal with one difficulty we do not aggravate others.

According to a summary on EPA's Web site:

> The enactment of the Clean Air Act of 1970 (1970 CAA) resulted in a major shift in the federal government's role in air pollution control. This legislation authorized the development of comprehensive federal and state regulations to limit emissions from both stationary (industrial) sources and mobile sources. Four major regulatory programs affecting stationary sources were initiated: the National Ambient Air Quality Standards (NAAQS, pronounced "knacks"), State Implementation Plans (SIPs), New Source Performance Standards (NSPS), and National Emission Standards for Hazardous Air Pollutants (NESHAPs). Furthermore, the enforcement authority was substantially expanded. [http://www.epa.gov/air/caa/caa_history.html#caa70]

For the auto industry, the 1970 CAA appeared to be a disaster. It called for a 90-percent reduction in hydrocarbon and carbon monoxide levels by 1975 and a 90-percent reduction in nitrogen oxides by 1976. The industry claimed it would be unable to meet the new standards and would have to shut down after the 1974 model year, which ended with introduction of the 1975 models in September 1974. As writer Tim Palucka put it:

> With the passage of the Clean Air Act of 1970, Congress threw down a gauntlet similar in spirit to President John F. Kennedy's 1961 challenge to put a man on the moon before the end of the decade. Both were bold strokes that placed a burden squarely on the shoulders of the nation's scientists and engineers. And both looked impossible . . . .
>
> In the race to clean up the air, no one knew if the goal, a 90 percent reduction in automobile emissions from pre-1968 levels by the 1975 model year, was even remotely possible. Moreover, Americans loved their thirsty automobiles; the petroleum industry depended on toxic lead in gasoline to increase octane; and automakers didn't want to add another costly device, especially one that would interfere with the cars' performance. [Palucka, Tim, "Doing the Impossible," *Invention and Technology*, Winter 2004, p. 23]

Although the manufacturers responded to the 1970 CAA "with a chorus of complaints," the government held firm, as Palucka pointed out. "It was 1975 or bust."

Impoundment Goes to Court

Despite continuing economic struggles, the government experienced a surplus in 1969, Nixon's first year in office but largely the result of President Johnson's budget proposals. It would be the last budget surplus until the 1990s. Economic historian John Steele Gordon summarized the situation facing the new President:

> Nixon was, as he said, a Keynesian. But as a Keynesian he knew that in times of high inflation and low unemployment, such as he faced when he entered office, it was time to tighten, not increase federal spending . . . . Thereafter, congressional appropriations, despite the good times, continued to rise, and Nixon impounded more and more money. [Gordon, John Steele, "The Federal Debt," *American Heritage*, November 1995, p. 90]

On August 14, 1970, the State of Missouri filed a class action suit on behalf of all State highway agencies against Secretary Volpe and OMB Director Shultz alleging that the Secretary had impounded funds apportioned to the State under the Federal-aid highway program for FY 1971. As reflected in an editorial in the October 1970 issue of AASHO's *American Highways* magazine, Missouri's suit was of interest to all States. The editorial noted that the Governors' Conference had recently adopted a resolution reading:

> Funds from the Highway Trust Fund should not be suspended or withheld; and we hereby request the Executive Committee to take the necessary steps to provide that court action be undertaken to challenge the authority of the Executive Branch of the Federal Government to withhold distribution of Highway Trust Funds.

Missouri argued that Secretary Volpe's decision to withhold the right of the State to obligate $26.2 million was wholly without authority. It also was wholly absent the one circumstance where he had the right to withhold obligation authority, namely advice from the Secretary of the Treasury that funds were not and would not be available to make reimbursements at the full amount of the apportionments. The stated basis for the withholding, according to the suit, was a desire for a "cooling of the economy" at a time when Missouri's economy was experiencing unemployment at a record high, bankruptcies occurring at a highly accelerated rate, and all other indications that the State's economy was definitely well "cooled."

Initially, the Justice Department maintained that the District Court did not have jurisdiction because the government cannot be sued without its permission. In December, Judge William H. Becker overruled the government's motion to dismiss the suit. He ordered Secretary Volpe and Director Shultz to justify the withholding.

Before Judge Becker could rule on the merits of the case, the Department of Transportation announced that the States would be allowed to obligate all funds originally apportioned to them. Judge Becker dismissed the suit as moot, but ruled that the State could submit an amended complaint if it wished to do so for FY 1972.

On June 30, 1971, the State filed suit against Secretary Volpe and new OMB Director Casper W. Weinberger. The suit stated that the Secretary had apportioned $115.7 million in Federal-aid highway funds to Missouri for FY 1972, but imposed contract controls on $21.9 million.

A group of Democratic Senators filed a brief supporting Missouri's right to receive its full funding on the schedule established by Congress rather than by an Executive Branch decision. The group included 14 of the Democratic chairmen of the Senate's 17 committees, with Chairman Samuel J. Ervin, Jr., of the Committee on Government Operations leading the way.

President Nixon planned to hold the budget to $250 billion as an inflationary measure even though doing so would require him to impound $7 to $10 billion. The President's practice, the brief argued, was "contemptuous of the role of Congress in our tripartite system . . . . The power of the purse belongs exclusively to Congress under the Constitution."

In discussing the friend-of-the-court plea, Senator Ervin said Congress should adopt a general anti-impoundment law. As Chairman of a subcommittee of the Judiciary Committee, he had introduced legislation in the 92nd Congress that would have given Congress the authority to override presidential impoundments. [Milius, Peter, and Braestrup, Peter, "17 Senators Join Suit to Free U.S. Funds," *The Washington Post*, January 3, 1973] Senator Ervin convened hearings and developed legislation on the subject, as did the House, but the legislation was not approved.

On August 7, 1972, the District Court ruled in Missouri's favor. The impoundment "caused great and incalculable injury to Missouri because of continuing inflation of highway costs and interruption of efficient obligations" of Federal-aid highway funds. The court found that the Secretary did not have the discretionary authority to defer obligation of highway funds previously apportioned to the State. The ruling enjoined further withholdings in FY 1973.

The Justice Department appealed the ruling, arguing that (1) there is no subject matter jurisdiction, (2) there is no justiciable issue since the case involves only a political question, and (3) that the Secretary possesses discretion under the statute to withhold funds for the stated reasons.

Part 2:
On Shaky Ground

A Highway Advocate Leaves the Scene

With the Federal-Aid Highway Act off 1970 enacted, Congress would not have to consider reauthorization of the Federal-aid highway program until 1972. The battle over the Highway Trust Fund would continue during the interim, but a familiar figure, Representative George H. Fallon, would not be around to enforce the trust built into the concept.

Following the first Earth Day in April 1970, environmentalists compiled a list of "The Dirty Dozen" Members of Congress. They were chosen because of what Environmental Action and the League of Conservation Voters said were their abysmal environmental records. Another criteria was that the Members of Congress had to be in tight races in districts with major environmental issues that voters cared about.

Representative Fallon's was the most prominent name on the list. He had been Chairman since January 1965 of the Public Works Committee, which the environmentalists referred to as the Pork Committee. His hometown of Baltimore had long-running controversies over its Interstate routes, including I-70 through Leakin Park and a stable minority community and a planned I-95 bridge across the Patapsco River overlooking historic Fort McHenry. The environmentalists cited his opposition to the use of Highway Trust Fund revenue for mass transit as one example of why he was a "tool of the highway lobby."

In the Democratic primary, State Delegate Paul S. Sarbanes attacked Fallon for his age and health, remoteness from his constituents, close ties with the highway and transportation lobbies, and his support for the Vietnam War. Despite Fallon's support from highway interests, Sarbanes won the primary election on September 15, 1970, and went on to win the general election in November. "I used to be complimented," Fallon said, "on the great job I was doing for the highway program. Now that is the thing that is used against me."

Six others of the Dirty Dozen also lost their reelection bids, but Fallon's defeat in 1970 was the environmental community's greatest triumph. As *Fortune* magazine pointed out:

> Flushed with their success at knocking off the powerful Fallon, environmentalists have gone on to organize the Highway Action Coalition at the national level to eliminate the federal highway trust fund or stretch the uses to which it can be put. [Cameron, Juan, "How the Interstate Changed the Face of the Nation," *Fortune*, July 1971, p. 31]

As a result, one of the strongest protectors of the Highway Trust Fund would no longer be in Congress when the biggest challenge to what critics thought of as a pork barrel came about.

Another author of the Federal-Aid Highway Act of 1956, Senator Gore, also was defeated for reelection in 1970. The Nixon Administration had targeted Senator Gore, who was vulnerable in his southern State for his opposition to the Vietnam War, support for civil rights legislation, and opposition to President Nixon's unsuccessful Supreme Court nominees, Clement F. Haynesworth, Jr., and Harrold Carswell. Vice President Agnew, campaigning for Representative Bill Brock, referred to Senator Gore as the "Southern Regional chairman of the eastern establishment" and a "radic-lib." Journalist and author David Halberstam, who had been a reporter with the Nashville *Tennessean* for 4 years in the late 1950s and had covered the Civil Rights Movement for *The New York Times* in the 1960s, described the Brock campaign in the January 1971 issue of *Harper's Magazine*:

> . . . this is in fact the most disreputable and scurrilous race I have ever covered in Tennessee . . . . And while I have covered shabby racist campaigns in the past, there is something about this one which is distinctive. This is the first time that a campaign like this has been tied to the President, the Vice-President, and the Attorney General of the United States.

The loss of Senator Gore was less critical to highway supporters than Fallon's defeat. Gore left the highway-oriented activities of the Committee on Public Works in 1959 and joined the Committee on Foreign Affairs, where his interests took him away from the highway battles. [Gore, Albert, *Let the Glory Out: My South and Its Politics*, The Viking Press, 1972, p. 262, 275]

A New Direction

Completion of work on the Federal-Aid Highway Act of 1970 marked only a temporary high point for the highway community. They thought they would have at least a year free of legislative battles and could focus on reversing the continuing deterioration of their image and the growing threat to the Highway Trust Fund.

Instead, the highway community was under attack from all sides, including the Nixon Administration.

After two Democratic Presidents, Kennedy and Johnson, who believed in an expansive Federal Government, President Nixon revived the debate that had begun under President Eisenhower over the balance between the Federal and State governments. Like President Eisenhower, Nixon thought that many Federal programs infringed on State rights, and adopted policies to reverse the flow of power.

General Revenue Sharing was the most direct result of this view. In President Nixon's message to Congress on August 13, 1969, he began:

> If there is a single phenomenon that has marked the recent history of nations, large and small, democratic and dictatorial, it has been the rise of the central government.

He traced the acceleration to the Depression "when economic life in America stagnated, and an energetic national government seemed the sole instrument of national revival." For more than 30 years, "whenever a great social change was needed, a new national program was the automatic and inevitable response." Now, he said, "a majority of Americans no longer supports the continued extension of federal services." He outlined his proposal:

> This week, I am sending to Congress for its approval for Fiscal Year 1971, legislation asking that a set amount of Federal revenues be returned annually to the States to be used as the States and their local governments see fit—without Federal strings.
>
> Because of budget stringencies, the initial fund set aside to start the program will not be great—$500 million. The role of the Federal government will be redefined and re-directed . . . . Ultimately, it is our hope to use this mechanism to so strengthen State and local government that by the end of the coming decade, the political landscape of America will be visibly altered, and States and cities will have a far greater share of power and responsibility for solving their own problems. The role of the Federal Government will be re-defined and re-directed toward those functions where it proves itself the only or the most suitable instrument.

The proposal was not an easy sell in Congress. As journalist Elizabeth Drew explained:

> What proponents were up against were the bureaucracies that administered the programs, the interest groups that benefits from them, and the congressional committees that had jurisdiction over them . . . .The idea was to reduce paperwork and the size of the federal bureaucracy and get the decision making "closer to the people." But many liberals, suspicious that the states wouldn't observe the standards and rules set by the federal government, and concerned that they would spend the money on programs other than for the poor, opposed the block-grant program vigorously. [Drew, Elizabeth, *Richard M. Nixon*, Times Books, Henry Holt and Company, 2007, p. 57]

President Nixon followed his General Revenue Sharing proposal with related proposals calling for consolidation of specific Federal activities, namely law enforcement, urban development, education, training, and rural development. On March 18, 1971, Nixon proposed a similar concept for the Department of Transportation. During the early days, he said, "a man's mobility was dependent upon his strong legs and the sharp axe with which he cleared his path." Even then, "Americans quickly came to realize that good roads and docks and bridges were community concerns." He continued:

> Over the years, government has become increasingly involved in improving the Nation's transportation systems, from the building of post roads and canals in the early periods of our history, to the construction of airports and superhighways in recent years. The question we face today, therefore, is not whether government should participate in transportation matters, but how government should participate—and which levels of government should undertake which responsibilities. These are the central questions I am addressing in this message as I outline a new Special Revenue Sharing Program for Transportation.

He called the airplane and automobile "mechanized masterpieces," but also "dramatic evidence of both the successes and the failures of American transportation." He said of highways:

> Highways that speed motorists between cities can become long and narrow parking lots where cars are stalled for hours within urban areas. It often takes longer to move by "horseless carriage" across our major cities today than it did by horse-drawn carriage a century ago. Efforts to improve this situation by building new highways often have the effect of destroying neighborhoods and disrupting lives. It is estimated, moreover, that automobiles are responsible for almost half of our air pollution—a growing problem that is slowly choking our central cities.
>
> And there is another serious problem, as well. For with our heavy investment in automobiles and air transportation has come a sharp decline in rail passenger service and in public mass transit systems . . . . Public transportation has been caught up in a vicious cycle of increasing costs, rising fares, shrinking profits, decreasing quality, and declining ridership. Ironically, this decline in mass transit has come at the same time that the need for fast, convenient, economical public transportation has become greater than ever before.

The "established relationships among Federal, State and local governments are unsuitable for achieving the goals we pursue," which he called "balanced transportation":

> A balanced transportation system is essentially one that provides adequate transportation not just for some of the people in a community but for all the people in a community. A balanced system also recognizes that an individual can have different transportation needs at different times. Such a system treats speed as only one of the factors in the transportation equation and does not ignore the importance of other qualities such as comfort, safety, and reliability.
>
> Despite our technological capacity, we do not enjoy a fully balanced transportation system in modern America, particularly in our larger cities. We have relied too much on cars and on highways; we have given too little attention to other modes of travel. Approximately 94 percent of all travel in urbanized areas is by automobile, yet about 25 percent of our people—especially the old, the very young, the poor and the handicapped—do not drive a car. They have been poorly served by our transportation strategy.

Federal decisions on funding levels and matching shares had distorted the efforts by State and local officials to address the problems they saw:

> The Federal Government now pays 90 percent of the costs for a new interstate expressway, for example, but only 67 percent of the costs for a new mass transit system and only 50 percent of the costs of building an airport. It is little wonder that State and local planners encouraged to cover the landscape with ribbons of concrete. Such distortions of local priorities are among the major problems that this administration is seeking to correct . . . .
>
> The hard fact is that the best mixture of transportation modes is not something that remote officials in Washington can determine in advance for all cities, of all sizes and descriptions, in all parts of the country. Nor do the Federal officials who grant money for specific

> projects understand local needs well enough to justify their strong influence over how local projects should be planned and run.

His proposal, initially funded at $2.566 billion beginning January 1, 1972, was designed "to focus Federal resources on major public problems and at the same time maximize flexibility of choice at the State and local level.

Elizabeth Parker, a former Department of Transportation policy official writing in *Transportation Quarterly*, said the 1971 Transportation Revenue Sharing proposal would abolish almost every funding category within the Department of Transportation except the Interstate program. It proposed a "general transportation element" that the States could use to fund any transportation project they chose, highway, transit, or aviation. A second category would be available only for bus or rail mass transit projects in cities, including private companies providing transit service, while a third category was available for the Secretary of Transportation's discretionary use to encourage planning, research and demonstration projects, and other activities related to national transportation objectives. [Parker, Elizabeth, "Major Proposals to Restructure the Highway Program," *Transportation* Quarterly, January 1991, p. 56 http://www.fhwa.dot.gov/infrastructure/restructure.cfm]

As Parker noted, the Interstate System would be excluded from revenue sharing. The President explained that with 74 percent of the 42,500-mile System open and completion expected in 1978, "it would not be in the national interest to alter the basic funding mechanism for the construction of this system at this time."

Revenue would come from the Highway Trust Fund, the Airport and Airway Trust Fund, and general tax revenues on a changing schedule that the President described:

> In the first year of operation, Special Revenue Sharing money would be drawn from the two trust funds and from general revenues in the same proportion as under the existing categorical grant system, though it could be spent as the localities see fit. After that, however, the portion of the Special Revenue Sharing Program for Transportation derived from the trust funds in any year would equal the portion of the program that was used for highways and for aviation-related purposes in the preceding year. Thus the money in the trust funds would still go to achieve the general purposes for which the funds were established. General funds would pay for all other transportation activities.

The President acknowledged the need for improved highway safety and the growing sensitivity to environmental concerns:

> There is no reason why growing sensitivity on matters such as safety and environmental quality should not continue to grow under this new Special Revenue Sharing program. State and local governments, after all, have often been particularly responsive to citizen pressure in these areas and they have frequently acted as bold pioneers in meeting these concerns. I am confident that as more responsibility is given to governments closer to the people, the

> true and abiding interests of the people will be even better reflected in public policy decisions.

In a press conference on the day of the President's message to Congress, Secretary Volpe acknowledged that freeing the Highway Trust Fund revenue for use at each State's discretion "isn't going to be easy." As *The Wall Street Journal* discussed in its article about the proposal, Volpe had advocated a transportation trust fund that would allow communities to use highway funds for transit or aviation needs. Just 2 months earlier he had said of the idea "it is going to require a tremendously energetic education campaign" to convince Congress and the highway interests to support the idea. ["Three Transportation Funds Recommended in Nixon's Fifth Revenue-Sharing Message," *The Wall Street Journal*, March 19, 1971]

The New York Times reported that State and local officials quickly embraced the proposal:

> The very element of the program that has attracted mayors and governors, however, may ultimately doom it in Congress, where the highway lobby is expected to strongly oppose the idea that local communities should be given freedom to spend $1.5 billion in highway funds on other projects. Accordingly, most observers give the transportation proposal no greater chance of passage than Mr. Nixon's other "special" revenue-sharing programs . . . .
>
> Each program submitted so far has evoked strong opposition from congressmen reluctant to abandon programs they helped devise, and from those who do not believe that states and cities are any better equipped than the federal government to spend the money. [Semple, Jr., Robert B., "President Urges Mass Transit Aid," *The New York Times*, March 19, 1971]

Highway boosters were not persuaded. Representative Boggs, having assumed the position of Majority Leader on January 3, 1971, called the proposal "a fraud . . . the biggest demagoguery I have ever heard of." Representative John. A. Blatnik (D-Mn.) told ARBA that the proposal was a little "late." He explained:

> For 55 years we have considered Federal-aid for Highways to be revenue sharing. Any drastic change in program concept or funding, such as that being proposed, must be given thoughtful consideration and adopted only after there is unquestionable proof that it is both necessary and desirable.

He did not believe that roads and bridges should suffer so that the quality of other modes of transportation can be improved. ["Boggs Attacks Sharing Plans," *New Orleans Times-Picayune*, March 24, 1971; "Blatnik: Beware Revenue Sharing," *Better Roads*, April 1971, p. 10]

Traffic World summarized reaction to the proposal:

> The President's proposals involving these trust funds left some doubt in the minds of many motor carrier and airline officials. Several told *Traffic World* that they were unclear as to just what would happen to trust fund money under the Presidential plan. Some felt their industries would be adversely affected . . . . The phrase that most upset motor carrier and

> airline officials . . . is that giving local governments power to spend trust fund money "as they see fit." Several industry officials interpret this as permitting local governments to spend airport/airway trust fund money on projects unrelated to air or truck transport. ["Revenue Sharing Plan for Transportation Would Give Local Governments $2.5 billion," *Traffic World*, March 22, 1971]

Aviation Week & Space Technology reported that Chairman Mills of the House Ways and Means Committee was "strongly opposed" and his view was "widely shared in both House and Senate." The magazine continued:

> [The] concept of a unified transportation fund, even without the revenue-sharing feature, has consistently met powerful opposition from committee chairman [sic] unwilling to surrender jurisdiction over their particular areas of transportation funding.

The jurisdictional issue was reflected in the fact that Senate leaders distributed the Nixon proposal to five committees for study (Commerce, Public Works, Banking, Housing and Urban Affairs, and Finance).

Even as these committees began their review, another proposal was introduced:

> Sen. Charles H. Percy (R-Ill.) submitted a series of bills last week which would establish a unified transportation trust fund comprising all current trust funds and grants-in-aid programs. The Percy legislation would involve up to $7 billion the first year, compared with the Nixon Administration's proposal which would involve $2.6 billion.
>
> Sen. Percy left unclear the means of distribution of the trust fund monies, in an effort to sidestep the volatile revenue-sharing controversy. One of Sen. Percy's measures would permit diversion of highway trust fund money "for any legitimate transportation purpose," including mass transit. [Winston, Donald C., "Nixon Transportation Trust Fund Idea Hit," *Aviation Week & Space Technology*, March 29, 1971]

An editorial in *Engineering News-Record*, which had advocated such a plan, said the "greatest single advantage" was that it "would give states and municipalities flexibility in using funds to meet their highest priority needs." It continued:

> But giving state and local officials more freedom of action would test highway proponents' constant assertions that the public desires their product above all, without diverting any portion of their trust fund . . . . The plan would also test our assertion that highway spending will not drop in the long run because highway needs continue to increase at least as fast as needs for other forms of transportation. Though commitments for public transportation might jump in the initial years of the program, they would probably ease thereafter.

> If highway proponents really believe their own promotion material, let them put it to the test while preserving their trust fund. ["Revenue Sharing—Transportation Style," *Engineering News-Record*, March 25, 1971]

For transit interests, the Nixon proposal provided new hope even beyond the authorizations supporting the Urban Mass Transportation Act. Boston's transit authority, for example, had "mixed emotions" about it. The idea of not having to match Federal funds was appealing, but under the complicated apportionment formula, the city might receive less than at present. [Plotkin A. S., "Reaction 'Mixed' For Transit Plan," *The Boston Globe*, March 19, 1971]

An editorial in the *New Orleans Times-Picayune* endorsed the concept of balanced transportation that the proposal reflected:

> If Congress goes along, hard-pressed national policymakers and local urban managers may, at long last, be placed in a position to put it all together right. ["Strike the 'Balance' in Transportation," *New Orleans Times-Picayune*, March 23, 1971]

The President had placed his proposal in the context of a balanced transportation system. On May 20, 1971, Administrator Turner addressed the topic in a National Transportation Week speech titled "Balanced Transportation – What Is It?" before the National Capital Section of the American Society of Civil Engineers:

> So, at the outset, let us get into focus what balanced transportation really means.
>
> First of all, it does not mean the expenditure of equal amounts of dollars on each of several particular transportation modes. In fact, to do so would insure the very imbalance in our transportation system which everyone is deploring.
>
> What balanced transportation does mean is that each mode is utilized and supported in such amount as to achieve an over-all integrated system in which all modes are complementary–not duplicative, nor competitive.
>
> A balanced transportation system must be designed to meet the total transportation needs of the urban area. It should do so in a way that will provide the most effective, acceptable, and economic service attainable that meets the total needs of the community, both as individuals and collectively.
>
> If it is to serve the total transportation needs, a balanced system must permit infinite flexibility of travel from any place to any other place. A balanced system must be designed not just for morning and evening rush hour travel demand, but for 24-hour usage every day. It must be designed not just for those trips when citizens are commuters, but for all the other times as well as when the same citizens and their neighbors are making their non-work trips, which trips far outnumber the work trips. It must also provide for the movement of the goods and service vehicles that are vital to all residents of any urban area whether they

> be commuters or stay-at-homes, or are totally dependent shut-ins, who don't even own or operate their own automobile.

He cautioned against the common misconception about rail rapid transit systems such as the Metro system then under construction in the Washington area:

> Unfortunately, though, there are some people who believe that with the advent of a rail rapid transit system there will then be no need for highways. Nothing could be further from the truth, and if this concept should prevail, the consequences for this metropolitan area will be nothing less than catastrophic . . . .
>
> I know that there are some people who for one reason or another say that they hate both highways and automobiles, and wish that they would just go away, to be replaced by some undefined form of Utopia where there would be no traffic problems. But there will be no disappearance of the traffic problem unless people also disappear – our urgent task is to develop the best way to live with the auto, and quit wasting our time simplistically wishing it would go away, just by putting all of our chips on another mode. We need more – not less transportation capability – and to achieve it we need both more highway and more mass transit capability – not less of either . . . .
>
> Let us not be deluded – nor deceived – into thinking that [mass transit facilities] will eliminate the urgent need for new and improved highways, or that they can provide the services, and movement of goods that highways must do.
>
> And let us not make the mistake of taking vitally needed funds from the highway mode to help finance any other mode unless a real total improvement in transportation results therefrom. Such fiscal legerdemain would merely be like all magic tricks: only an illusion accomplished by an instantaneous distracting movement of the hands and mouth, followed by immediate disappearance of the illusion.
>
> If more funds are needed for mass transportation purposes, and certainly they are, by all means let us try to find them – but not by robbing the highway program with its equal or even more compelling needs . . . .
>
> Because we know what happens when something loses its balance.
>
> It falls.

Secretary Volpe promoted transportation revenue sharing, as well as balance, in his appearances. In Watertown, New York, he said, "A greater realization is needed on the part of the American people of the need for more balance with the transportation system." Convincing people of the need for balance was one of his greatest problems. Too much emphasis had been placed on highways and airways; he stressed "the need to work in harmony with the environment." He cited bus and rail service as needed alternatives to relieve congestion and pollution, and identified the new passenger rail service Amtrak as having "a good future over the car." [Jackson, Wendy B., "Balanced Transportation Setup Stressed as Vital by Volpe," *Watertown Daily Times*, July 22, 1971]

Congress approved the President's General Revenue Sharing proposal in the fall of 1972. The State and Local Fiscal Assistance Act of 1972 authorized $30.2 billion for State and local governments over 5 years. States, which received one-third of the funds, could use their share in any way they chose. Local governments were required to use their funds to attack broadly defined "priority" areas: public safety, environmental protection, public transportation, health, recreation, libraries, and social services for the poor and aged. The legislation specified that public transportation included transit systems, streets, and roads. The funds could be used for capital expenditures or "ordinary and necessary maintenance and operating expenses," including for transit systems. In addition, the funds could be used for such activities as rail-highway grade crossing projects, parking and storage facilities serving public transportation, and even snow and ice control.

On October 20, 1972, President Nixon signed the State and Local Fiscal Assistance Act of 1972 in Independence Square in Philadelphia, site of the Constitutional Convention of 1787. The legislation was, he said, the start of a new American revolution. He explained that, "the most important point is this: In each case it will be local officials responding to local conditions and local constituencies who will decide what should happen, and not some distant bureaucrat in Washington, D.C." (General Revenue Sharing continued until the Omnibus Budget Reconciliation Act of 1985 brought it to an end.)

The transportation revenue sharing proposal met a different fate. As Elizabeth Parker summarized, the concept was in line with Nixon's philosophy and States' longstanding interest in taking over the bulk of the Federal-aid highway program, but was contrary to "virtually all of the interests involved" in transportation. Highway interests feared that highway user tax revenues would be diverted to other modal projects, while transit interests feared the mighty highway lobby would divert the limited Federal funding for transit. [Parker, p. 56]

Without support from the modal interests, the proposal went nowhere in Congress. In September 1971, President Nixon postponed the effective date of Special Revenue Sharing for Transportation from January 1, 1972, to January 1, 1973. As *Railway Age* put it:

> The postponement confirms what everyone always knew: a transportation revenue sharing plan, in a Presidential election-year with Congress besieged by demands for transportation funding of one kind or another, had about as much chance as the proverbial snowball. ["Revenue Sharing: The Plan That Was Isn't," *Railway Age*, September 26, 1971]

Terms of Battle

On December 16, 1970, the *Buffalo Evening News* published a portion of an interview with Secretary Volpe. Asked if he bought the argument that Highway Trust Fund revenues should be used for other forms of transportation, the Secretary replied:

> I don’t buy the argument that funds can be used only for the design and construction of highways. I sincerely believe that any item which is highway related can and should come out of the highway trust fund. For instance, we have an alcohol counter-measures program and our safety programs. We wouldn’t need these programs if we didn’t have highways and automobiles.
>
> So far as I am concerned, it is highway related and should come out of the highway trust fund.

He felt the same way about the highway beautification program and forest roads, but did not believe the funds should be used for general purposes such as welfare or education “because it was raised for a particular purpose.” [Warren, Lucian, “Volpe Sees Many Uses for U.S. Highway Funds,” *Buffalo Evening News*, December 16, 1970]

Congress, in developing the Federal-Aid Highway Act of 1970, had expanded the use of highway user tax revenue beyond the original intent of design and construction of highways, even to the point of paying for some transit activities. The legislation was consistent with Secretary Volpe’s view that in going beyond design and construction, additional costs should be highway-related, as in the case of buses. However, pressures to expand the idea of “highway-related” would continue through 1971, with supporters of transit pushing for access to revenue from the Highway Trust Fund in a year when Congress would not consider Federal-aid highway legislation.

In early January, Tom Wicker wrote in his syndicated *New York Times* column of the “magnificent American interstate system” now “nearing completion”:

> On any rational timetable, this is about 10 years behind time, since these great highways essentially were the transportation system most required for the Forties and Fifties. Consequently, the nation also is running 10 or more years behind in developing the modern urban transit and rapid intercity transit systems that are the next necessary stage in American transportation.

Standing against this evolution was “a political juggernaut” that had formed during the Interstate years. [Wicker, Tom, “The Highway Juggernaut is Not Easily Halted,” *The New York Times*, January 10, 1971]

Frustration with traffic congestion was prompting cities to adopt traffic bans, as discussed in a canvass of such plans published in *The New York Times* on April 25:

> America’s love affair with the automobile, a torrid romance for decades, appears to be cooling off in a number of cities. While divorce isn’t imminent, some trial separations are already under way.
>
> Encouraged in part [by] experiments like the one here this week along Madison Avenue, the cities are shutting down some of their prime downtown streets to traffic, banning on-street parking and turning the areas over to pedestrians.

Typically, people on the streets appreciated the relief from the traffic while merchants opposed the bans even when the predicted slump in commerce did not occur. Even a year earlier, a check of major cities revealed "little but apathy toward the idea," but now the movement "is clearly growing around the country." In Philadelphia, for example, officials planned to close a seven-block area to traffic in the mid-city shopping district as part of a "Take a Walk" initiative. San Francisco had gradually prohibited parking along 30 city blocks and converted others to one-way traffic, with the effect of sharply reducing traffic. Chicago was studying a traffic ban despite strong opposition from merchants. Boston planned to ban traffic on a one-day basis in May along four blocks of a downtown street to give the feel of a suburban shopping center. Washington had experimented the previous fall with a traffic ban every Thursday evening over a seven-block area, again in an attempt to revitalize shopping.

Some cities were resisting the movement. For example, Burt Lieper of the Los Angeles Traffic Department said the city had no plans for traffic bans. "We want the traffic to flow if it can, and the pedestrians to walk if they can." Detroit also had no plans for bans, although other Michigan cities, including Lansing and Kalamazoo, had limited downtown traffic or created pedestrian malls. [King, Wayne, "Cities Showing Interest in Traffic Bans," *The New York Times*, April 25]

A few weeks later, the *Times* reported on "the swelling army of [adult] Americans on two wheels who have discovered nature, freedom, forgotten muscles, deep breathing, new friends, new enemies—even romance—on bicycles." The bicycle was emerging from the era when it was primarily a means of conveyance for children until they were old enough to get a driver's license. Bike sales, especially to adults, had risen in the past 10 years from 3.7 million to almost 7 million:

> Today, to start National Transportation Week, Secretary of Transportation John Volpe led a fleet of 300 bicycle enthusiasts on a six-mile ride from the Watergate apartments where he lives past the Washington Monument and the Lincoln Memorial on the banks of the Potomac River. The Secretary told his fellow travelers that his department would make "every effort" to establish exclusive bicycle lanes in the nation's cities and along the freeways and turnpikes between cities.

Since this event was D.C. Bicycle Day, Mayor Walter E. Washington and City Council Chairman Gilbert Hahn, Jr., were among those accompanying the Secretary. Ideas for the District of Columbia included color-code streets for cyclists, cycle-only lanes, installation of bike racks at Federal installations, and creation of concessions to rent bicycles to tourists interested in seeing the city.

Signs along the route proclaimed "All Persons Have Equal Rights When Driving Cars or Riding Bikes." It was, the article explained, "a civil right with which most city motorists would violently disagree." (Secretary Volpe, a bicycling and fitness enthusiast, owned a fold-up bike and a lightweight, multi-speed racer.)

A few days earlier, on May 6, Members of Congress participated in the first "bikecology" tour of Capitol Hill on a rainy day, with Capitol Hill police clearing a path through traffic for the 13-block ride. Representative Seymour Halpern (R-NY), who had met his wife while bicycling in Central

Park, sponsored the tour partly to demonstrate how to reduce air pollution and partly for fun. Thirty-five Members had signed up for the tour and another 11 said they might participate, but only 26 participated. They could choose from 60 bicycles borrowed for the occasion. Senator Claiborne Pell (D-RI), the only Senator on the tour, indicated he had not ridden a bicycle since 1965 but on that occasion had won a race around the Ellipse.

Bicyclists were finding they could get to work on their vehicle, and many even sold their cars. Dr. Ralph Galan, an orthodontist and president of the League of American Wheelmen, cycled from his home in Lexington, Massachusetts, to his office in Cambridge:

> "That's nothing," he said, boasting that he can cover more than 100 miles a day.

Even in Los Angeles, "a center of smog and freeways," bicycle licenses were rising sharply. Charles Johnson of the Los Angeles Police Department's bike detail said:

> One of these days, you are going to see an awful lot of bikes on the streets—bikes by the hundreds. With traffic getting so heavy, they will have to change to something. Because of the traffic, because of the smog, because of the price of gas, you are going to have hundreds and hundreds of bikes on the streets. It will look just like a town in Europe. [Robertson, Nan, "Adults Swing to Bicycles," *The New York Times*, May 19, 1971; Dobbin, Muriel, "'Bikecology' Gets Ride at the Capitol," *The Baltimore Sun*, May 7, 1971; Kneece, Jack, "Transportation Week to Star Cycling Volpe," *The Washington Star*, May 16, 1971]]

The *Times* returned to the subject in August with "Bicycle Business is Booming." The subhead was:

Big Adult Market is Bringing Euphoria to Industry

The article said that "for the first time in a century," the American bicycle industry "is pinning its rosy expectations on an unlimited adult market instead of a static youth one." The article listed several factors behind the boom:

- Physical fitness consciousness. Fifteen years ago, Dr. Paul Dudley White, President Eisenhower's physician, endorsed the bicycle as a weapon against heart attacks . . . .
- The newer ecology interest. The bicycle, as the president of the Columbia Manufacturing Company has pointed out, is the only form of transportation – including the horse – that doesn't pollute.
- Encouragement for bicycle riding from municipal, state, and Federal Government programs. The Bicycle Institute of America says that 6,300 miles of bicycle paths have been laid out in 200 cities. The institute has pushed for legislation such as a law recently enacted in Oregon that permits revenues to be set aside from gasoline and road use revenues for bicycle paths. Representative Edward Koch, Democrat of New York, has introduced a bill that would permit states to use Federal highway money for paths.

- Trend-setters like Jacqueline Onassis and Mayor John V. Lindsay of New York help the fashion-status of cycling while bicycle championships and races such as the eight-day Tour of California also kindle consumer interest.

These factors were overshadowed by a more significant reason:

> The introduction of the lightweight, 10-speed bicycle by Schwinn in 1958 was as significant for the bicycle industry as the development of stereo components was for recordings.

Schwinn's Ray Caparros said, "If we were still pedaling on those 15-pound tires and foot brakes, no adults would be on bikes today."

Another factor was suggested by Eugene Sloane, whose *The Complete Book of Bicycling* had become a bestseller since its publication in October 1970:

> He attributes the bike boom to the fact that "people got sick and tired of jogging—that's got to be the most boring thing." [Bender, Marylin, "Bicycle Business is Booming," *The New York Times*, August 15, 1971; Sloane's bestselling book was published by Trident Press]

In June, former Secretary Boyd (then president of the Illinois Central Railroad) participated in a 2-day conference in Washington to explore the idea of developing a free public transit system in the United States. Over 40 national organizations sponsored the conference, including the Conservation Foundation, National Urban Coalition, and many environmental and labor groups. An article about the conference summarized Boyd's keynote address:

> It is time, Boyd said, that Americans consider the over-all cost of transportation, get rid of the myth that busses [sic] can be paid for out of the fare box and consider that free transportation might involve the least cost. Boyd said in a keynote address that the public was subsidizing a private transit system in which the public used automobiles to reach downtown areas. Urban areas, he said, cannot tolerate an unlimited influx of motor vehicles.

Under Secretary of Transportation Beggs told the conference that 94 percent of all urban travel was in an automobile. Mass transit use was only a fourth of what it was after World War II, and was still declining:

> This overdependence on the automobile as the solution to people's transportation needs has reached the point in our country where we now have almost as many vehicles as we do people. We have one car for every 50 yards of highway.

He called attention to the Urban Mass Transportation Assistance Act and the highway transit provisions of the Federal-Aid Highway Act, although he also warned about overemphasis on rail rapid transit. Rail might be feasible in the 10 largest cities, but elsewhere, the answer was bus transit.

Theodore W. Kheel co-chaired the meeting. A lawyer, and labor mediator from New York City, Kheel had helped settle many strikes in New York City and elsewhere. In 1964, President Johnson had asked Kheel to help mediate the negotiations to prevent a nationwide rail walkout. Transportation, however, was one of his many interests.

Kheel pointed out the trend since World War II to abandon mass transit in favor of the automobile. The resulting war between mass and private transportation had resulted in incalculable injury. "Those who have switched to personal from mass transportation now suffer from traffic congestion and air pollution just as riders of mass transportation suffer from poor service and dilapidated facilities." He urged the Department of Justice to force General Motors out of the business of manufacturing buses. "General Motors, the largest maker of private cars, is likewise the largest maker of buses. These two methods of transportation are in deadly competition with each other. [Wyant, Jr., William K., "Free Public Transit Called Urban Solution," *St. Louis Post-Dispatch*, June 2, 1971]

In 1971, Kheel became advisory committee chairman of the Highway Action Coalition, which environmentalists had formed in the wake of the defeat of Representative Fallon and other "Dirty Dozen" Members of Congress. The coalition held its first press conference in Washington on September 23. Professor Tom Lewis described the group:

> Claiming to represent 750,000 people across America, Highway Action Coalition was actually a loose alliance of those who supported environmental causes like the Sierra Club, Environmental Action, Friends of the Earth, and Zero Population Growth. A year earlier they had joined together with the common goal of persuading Congress to ground the supersonic transport plane, a project that Volpe and the Department of Transportation had long championed. Fresh from that victory [Congress ended funding for the project in March 1971], they reconstituted themselves as an anti-highway coalition with the single goal of "busting the trust." [Lewis, p. 225]

(The House voted 215-204 to end funding for development of the SST on March 18, 1971, but the Nixon Administration hoped to revive the project in the Senate. On March 24, the Senate voted 51-46 to bring SST development funding to a halt. The President called the vote a "severe blow" to the aerospace industry, leaving the SST to Europe. The following day, a spokesperson for the Office of SST Development in the Department of Transportation said, "We're out of business." A consortium of Air France and British Airways continued development of the Concorde SST, which began commercial service in 1976 and continued until a decline in business ended the flights in 2003.

(Volpe had backed the SST, even meeting with the President during March to bolster his flagging support. "How would you like," Volpe told the President, "to go out to Dulles Airport and see an SST with the words 'Made in the USSR' on it?" Despite the defeat in the Congress, Volpe kept a model of the SST on his desk for the remainder of his term in office. [Kilgore, p. 189])

Kheel said of the coalition:

> We are determined to take on the most powerful lobby this country has created—the automobile industry; insurance and real estate companies; the road builders and construction industry; the oil companies and all their cohorts at the Federal Highway Administration—and start demanding that this Administration and the ones that follow it put a stop to this carnage on our roads and in our cities.
>
> The Highway Trust Fund is going to be "busted open." We must begin to use this fantastic resource in cities and states for the kind of transportation that serves people, not machines.

The Interstate System, he said, "has wreaked havoc in our countryside and in urban areas; it must be declared completed and halted now." He wanted to open the Highway Trust Fund to public suggestions on the best use of its revenue. He advocated a moratorium on urban highway construction "until we can begin to re-dress the past imbalance and provide public transportation that is cheap, pollution-free, efficient and available to all who need it."

In a press conference in Washington on September 23, he expressed special concern for the disadvantaged:

> The poor are walled in by concrete monsters we call superhighways; he cannot afford the luxury of an automobile to travel to outlying suburbs where the jobs are. The handicapped [are] forced to live a restricted life because adequate public transportation is either not available or so expensive as to make it unacceptable. The young are denied mobility except through media demands that they fulfill their sex life through the roaring, gadget-filled automobile. ["Kheel: Block Road $," *The New York Post*, September 23, 1971]

The coalition was focused on the legislation that would be needed in 1972 to reauthorize the Federal-aid highway program. For the highway community, *The Christian Science Monitor* noted, "its road may be rougher than ever before." It said:

> Strong forces are gathering for another bid to divert some of the more than $5.6 billion a year that pours into the trust fund to support other transportation projects, especially building new mass-transit systems. In the past, highway interests have been able to turn back decisively efforts to spend the money generated by highway-user taxes for anything but roads. But this time they may have to make some tactical concessions.

The coalition saw positive signs, including the presidential election in 1972. "Voter enchantment with highway building has been fading ever since interstate-system construction stopped concentrating on long-haul expressways and began pushing through urban neighborhood." The newspaper predicted that, "Democratic presidential hopefuls will rival each other with plans for tapping trust fund revenues to build balanced transportation systems." [McKinsey, Philip W., "Environmentalists Challenge Highway Lobby Over Funds," *The Christian Science Monitor*, December 23, 1971]

The contrast between the Highway Action Coalition and the highway lobbyists who frequented Capitol Hill was stark, as Lewis pointed out:

> To some, the coalition's staff looked like sixties flower children who had gone to seed. Tie-dyed shirts, jeans, and sandals seemed to be the uniform for the staff of four. Mangy furniture, guitars, and grime were the most prominent features of their shabby seventh-floor offices on Dupont Circle [in Washington]. The contrast with their more established and wealthy adversaries could not have been more striking. Officials of the American Association of State Highway Officials and the American Road Builders Association generally dressed in dark suits and conservative ties. The road builders had built their quarters close to the new Department of Transportation building, while the highway officials preferred a gleaming building on North Capitol Street, close to the offices of the senators and representatives whom they so ardently courted.

John D. Kramer, the executive director of the coalition, took home a weekly salary of $75, which was lower than the lobbyists' daily expensive accounts:

> Yet Kramer had been brash enough to suggest in December 1971 that "in maybe just two years, we can open up the Highway Trust Fund to broader purposes, like mass transit." The executive director made up for the coalition's lack of funds by tapping the growing reservoir of resentment about urban Interstates. [Lewis, p. 225-226]

As of late October 1971, the coalition had raised only about $500 to run its Washington office. Barbara J. Reid, a codirector of the coalition and legislative director of Environmental Action, told *National Journal* that her group was "no match in terms of resources for the all-powerful highway lobby." They could not duplicate the lobby's tactics:

> We don't buy votes. We don't buy politicians. We are trying to educate people to turn their politics around so that their thinking will have an impact in Washington.

The coalition would not endorse pending bills, all of which were considered inadequate. Instead, *National Journal* listed what Miss Reid called the main elements of the sound, balanced transportation plan the coalition advocated:

- a transportation trust fund in place of the Highway Trust Fund.
- a system in which highway-user taxes from urban areas are devoted to transportation expenditures in urban areas.
- a government declaration that the interstate system is complete "so that the 80 per cent of federal ground transportation funds which annually go to construct the system" can be used for other kinds of transportation.
- more citizen participation at all levels and federal grants to assist citizens' groups in collecting technical data and formulating planning concepts.
- increased taxes on trucks to pay for their wear and tear of highways.
- no more new rights of way for urban freeways.
- payments from the new transportation trust fund for all social, environmental and economic costs of transportation, including traffic control systems, safety programs, maintenance of present transportation systems, capital expenditures and operating costs of public

> transportation, beautification, air and noise pollution programs, relocation costs and the upgrading of commuter railroads.

As mentioned earlier, legislative proposals had been introduced during the year that would shake up the status quo. Senators Kennedy and Representative Koch had introduced a bill in January that would combine revenue credited to the Highway Trust Fund and the Airport and Airways Trust Fund into one trust fund for all transportation. The automobile excise tax would be transferred from the general Treasury to the new Transportation Trust Fund. Senator Percy also had introduced a transportation trust fund bill. In addition, Senator Gaylord Nelson (D-Wi.) had introduced a bill that would allow States to use Highway Trust Fund revenues for urban mass transportation proposals, while Representative Ryan had introduced a comparable bill.

The Governor's Conference also had adopted a new policy on the Highway Trust Fund. In 1969, the Governors had proposed that the Department of Transportation study transportation policy, but rejected inclusion of consideration of a Transportation Trust Fund. In 1970, the Governors had strongly endorsed the Highway Trust Fund, but also a Mass Transit Trust Fund and limited flexibility for Governors to transfer funds among the Trust Funds. The new position, adopted in September 1971, said:

> We call for the creation of a unified transportation trust fund incorporating existing transportation revenues earmarked for use within a specific mode of transportation or by beginning a phased program of percentage transfers from the highway and aviation trust funds and other funds made available for transportation into the proposed unified national transportation trust fund.

Conference special assistant H. Michael Dye told the *National Journal* that the Governors wanted to reassert their decisionmaking authority in the face of efforts by State highway officials in the State legislatures.

The magazine interviewed Under Secretary Beggs about the issue:

> Beggs said the transportation trust fund, long favored by Transportation Secretary Volpe, has been shelved temporarily in favor of the President's special transportation revenue-sharing plan sent to Congress on March 17.
>
> Volpe on several occasions has outlined a plan to convert the Highway Trust Fund to a transportation trust fund with designated accounts for air, rail and ground systems. Under the plan, each mode would have its own source of revenue from user taxes, with some spillover allowed from one account to another.
>
> "I am sure that Secretary Volpe would push the transportation trust fund idea again if transportation revenue sharing were not enacted."

Even ARBA, which only the year before had wanted to extend the Highway Trust Fund through FY 1985, was at least considering the idea of a Transportation Trust Fund. An advisory group had recommended that ARBA's board of directors support creation of a Transportation Trust Fund. Director of Public Relations T. Randolph Russell explained that the advisors knew that OMB opposed the Highway Trust Fund. "We feel it is in the cards that some modifications of the trust fund are coming up. Consequently we felt that we ought to take the lead in supporting a transportation trust fund." The board, however, rejected the idea because it "scared some people right away."

Another factor was the change in congressional leadership. In the House, Representative Blatnik was the new Chairman of the Committee on Public Works. Senator Birch Bayh (D-In.) would be chairman of the Senate Subcommittee on Roads, a position that Senator Randolph had held in addition to his role as Chairman of the Public Works Committee. Observers considered Representative Blatnik and Senator Bayh to be "open-minded" on expanding the Highway Trust Fund, although Blatnik thought such proposals were premature. [Hirschberg, Vera, "Transportation Report/Mass-Transit Proponents Gather Support for Attack on Highway Trust Fund," *National Journal*, October 30, 1971, p. 21-28]

In an interview with the Highway User Federation's magazine, Blatnik said he thought the public, overall, supported the highway program, especially the Interstate System:

> It has taken a long time to build this new system, 15 years so far, and during the course of its construction some people have lost sight of the overall benefits and others, unfortunately, have had their lives adversely affected by it. We cannot ignore or blame either group for not being more enthusiastic. We can and should do more to keep the public better informed as to the need for improvement of highways and the benefits to be derived from their use.

Asked if he expected pressure for new uses of the Highway Trust Fund, including highway beautification and other modes of transportation, the new chairman said:

> There have always been pressures for expanded uses for the Trust Fund, from its inception in the 1956 Act, and you are quite correct that the 91st Congress widened the application of the fund somewhat in enacting the Federal-Aid Highway Act of 1970. I can't envision these pressures diminishing in the immediate future, and, in fact, the trend seems to be the other way. There is even a movement underway to replace the Highway Trust Fund entirely and set up in its place a national Transportation Trust Fund . . . . While I try to keep my own mind open to change, I do feel that any drastic change in that direction ought to be brought about only after there has been developed a case strong enough to justify it.

He thought that "some valid and thought-provoking arguments" could be made in support of allowing States to transfer a certain percentage of Highway Trust Fund revenue among modes as the National Governors' Conference had proposed in 1970 or a transportation trust fund as suggested by Secretary Volpe. He did not think Congress should "be blind" to the arguments for such an approach, but said that, "Our overriding concern must be what is best for the nation." Although he thought the facts would support the "continuing need for funding highway programs pretty much as we have and possibly more . . . we must keep an open mind to all features, including the methods of financing."

The public, Blatnik thought, supported the use of Highway Trust Fund revenue for highway-related activities, such as replacement housing, but might initially object to the use of the revenue for nonhighway modes. He reserved judgment in the absence of a specific proposal. [O'Toole, Stephen E., ". . . a forward look . . ." *Highway User*, February 1971, p. 8-10]

During 1971, several anti-highway books were published, including:

- Burby, John, *The Great American Motion Sickness: or Why You Can't Get There From Here*, Little, Brown.
- Kelley, Ben, *The Pavers and the Paved: The Real Cost of America's Highway Program*, Donald W. Brown, Inc.
- Robinson, John, *Highways and Our Environment*, McGraw-Hill Book Company.
- Schneider, Kenneth R., *Autokind vs. Mankind: An Analysis of Tyranny, a Proposal for Rebellion, a Plan for Reconstruction*, W. W. Norton.
- Stone, Tabor R., *Beyond the Automobile: Reshaping the Transportation Environment*, Prentice-Hall.
- Williams, Jr., Ernest W., Editor, *The Future of American Transportation*, Prentice-Hall.

Burby, whose book was cited earlier, covered the range of transportation modes, but Thomas R. Reid III summarized the book's viewpoint in a review in *The Washington Post*:

> In fact, as John Burby's book makes clear, the Department of Transportation's greatest failing has been its propensity to spend too much money promoting the wrong modes of transportation. In doing so, the department is carrying out the wishes of its political masters in Congress, who generally seem to be more concerned about the business interests of the transportation industry than about the needs of the public. [Reid III, Thomas R., "The Unregulated Transportation Mess," *The Washington Post*, August 3, 1971]

Mainstream magazines entered the debate. *Fortune* covered the debate in its July 1971 issue, quoted earlier. Juan Cameron acknowledged the scope and significance of the Interstate System, quoting Daniel Patrick Moynihan, then known as a former White House advisor, as saying future generations would "almost certainly judge [the Interstate System] to have had more influence on the shape and development of American cities and employment than any initiative of the middle third of the twentieth century." He added, "If anyone had realized the sheer magnitude of the interests affected by this road system, it is impossible to imagine that it would ever have been built."

Fierce opposition was now threatening the remaining mileage, as Cameron explained:

> The great irony of the Interstate is that opposition evoked by the changes it had brought now threatens to prevent completion of the System . . . . [The] mid-1960's saw the emergence of what has become a virtual highway rebellion. Today it is almost impossible to get a major Interstate project approved in most U.S. cities.

Cameron quoted Administrator Turner as downplaying the opposition as the "carping of a few dedicated critics" who "are blinded by their desire to discredit" the Interstate program.

Noting that the Highway Trust Fund had been called "a guaranteed annual wage for the highway industry," Cameron discussed the States' $320 billion worth of post-Interstate needs. James Dingwall, chief engineer of the Texas Highway Department, explained why these needs should be met. "In Texas the automobile is a way of life . . . . Until someone overcomes gravity our people are going to be on rubber tires." Cameron also quoted Alfred E. "Alf" Johnson, AASHO's executive director, as sniping at "policy makers" in Washington and other urban centers who "haven't any idea of what transportation is in the rest of the country":

> Among the policy makers he has in mind are the transportation planners on Secretary Volpe's staff and the influential John Ehrlichman, a White House assistant who formulated President Nixon's recent proposal to tap the highway trust fund for other kinds of transportation projects that governors might decide were needed. Johnson fumes, too, at the diversion of federal trust-funded monies away from construction as a result of legislative changes in recent years. Environmental and social aids, he notes, now absorb a substantial portion of federal highway money. "The relocation assistance, your double hearings, your environment, your conservation, your urban designs, your equal opportunity—those are all things that cost money. And a lot of these costs are for cosmetics, whose value is dubious."

What seemed clear was that a reordering of transportation priorities was on the horizon, possibly sooner than later. "The challenge is to cope with increased flows of people and goods without building more of the same—to make more efficient use of existing highways and to strengthen public transportation." [Cameron, p. 28-33]

Business Week profiled the Highway Action Coalition in the issue of December 11, 1971. "The militancy of the critics and the broadening base of public involvement in mass-transit issues will force the government to make a substantially better effort." Although some observers" thought the coalition could make better use of its energies boosting UMTA, the group's spokesman, John Kramer, thought the time was right for a frontal assault. "We know such funds can be abused, as uses are thought up to keep them going. But we like the guarantee of massive funds in the initial stages of a capital-intensive program like mass transit." ["Ecologists Attack the Highway Trust Fund," *Business Week*, December 11, 1971, p. 8-10]

Jack Anderson, the widely read muckraking columnist, wrote in January of a "blistering" study by the Urban Law Institute about the clash between the Federal-aid highway program and the Federal model cities program. The column began:

> The federal government has let two of its most promising projects strangle each other like "a brainless octopus ignorant of the activity of its own arms." This "foolish and wasteful" conflict between the multi-billion dollar federal highway system and the model cities program is costing the taxpayers hundreds of millions of dollars.

Charles Sevilla, author of the report, declared:

> The poor . . . pay with their homes and community so that the suburban commuter can make his daily sojourn in and out of the city. Highways are choking inner-city streets with traffic,

> enticing transit riders into their automobiles . . . and thus killing transit companies, and consuming billions of dollars each year that might be more efficiently used for mass transportation.

Anderson said that the loser in these conflicts was usually the Model City program, "despite federal laws that the state must guarantee adequate housing to displaced inner-city residents." The report described the problem:

> There appears to be a nationwide trend by state highway departments to falsify certifications to the federal highways officials of the existence of adequate housing. The collusion of federal officials in this process is a sorry commentary on the vigor of our national commitment to right the wrongs the highway program has inflicted on the poor.

At the heart of the problem was the requirement that Highway Trust Fund dollars must be spent on highways. Sevilla suggested the solution would be to let inner-city residents decide when they need urban highways. Anderson wrote:

> Some federal officials have refused even to sit down with inner-city leaders and discuss the highway plans.
>
> The study concludes that the city's highways, "its circulatory system," is "proving cancerous" through traffic jams, auto pollution and deafening noise. [Anderson, Jack, "Poor are Paying for U.S. Highways," The Washington Merry-Go-Round, *The Washington Post*, date unknown, early January 1971]

Anderson returned in September with a leaked document revealing a plot inside the Transportation Department "to block the construction of new rail systems to relieve the traffic in our congested, car-clogged cities." The highway lobby had instigated the opposition because it "wants the government instead to build more freeways."

The subject of the leak was Administrator Turner, "who always jumps when the highway lobby honks." He was "eager to entangle America in freeways and to pave over anything that gets in the way." Turner had frequently spoken about the value of mass transit in the form of buses, and had often criticized rail transit plans. Now, during a flight from Atlanta on "the Secretary's sleek Coast Guard jet," Turner had taken advantage of the opportunity "to fill Volpe's ear with arguments against subways." Arriving in Washington, Turner thought he had the Secretary's approval to draft a policy statement ending new subway starts – "all he needed was the routine acquiescence of Urban Mass Transportation czar C. C. Villarreal."

Turner, Anderson wrote, drafted a five-page memorandum for Volpe's signature agreeing to "discourage construction of entirely new rail-transit systems in cities that presently do not have any existing or under construction." Villarreal returned the draft to Turner "with a sharp note saying Turner's views were inconsistent with his own." Reached by Anderson or a member of his staff, Turner acknowledged the draft was one of his internal documents. His staff wrote numerous memoranda, he said, but that one "bears my name, and I have to take the responsibility for it." He was trying to resolve the differences with Villarreal. [Anderson, Jack, "Anti-Subway Plot," *The Washington Post*, September 11, 1971]

To counter criticism from across the broad spectrum of the media, the highway interests had merged three of their lobbying organizations. Beginning in January 1970, the Automobile Safety Foundation, the National Highway Users Conference, and the Auto Industry Safety Committee became the Highway Users Federation for Safety and Mobility (HUFSAM). The stated purpose of the consolidation was to create a strong organization to lead in the "development of adequate highways and the advancement of highway safety." The new group was headed by D. Grant Mickle, who had been with the Automotive Safety foundation since 1943. He also had been the first Deputy Federal Highway Administrator, taking the oath of office for the new position on October 17, 1961, and serving into 1963.

Burby wrote:

> With a name like Highway Users Federation for Safety and Mobility, from the outset the new group had to waste a great deal of its energy denying it was a new umbrella group put together to lead the highway lobby's fight to save the Trust Fund. The denials sounded rather feeble after the federation's first piece of literature appeared on June 1, urging civic groups, politicians, writers and others on a mailing list of thousands to ". . . Act Now! The Highway Trust Fund should be continued on a permanent basis for highways – with none of its money diverted. Now is the time to say, loud and clear, I want the money I pay for highways used for highways." [Burby, p. 311-312; ""'Consolidation," *Better Roads*, December 1969, p. 10]

Two weeks later, Anderson reported on another leak, this time regarding a plan by the highway lobby to dispatch "truth squads" to conduct a "name-calling" campaign against the environmentalists:

> The lobby will use a false front, ironically, to spread its version of the "truth." A phony "Speakers' Bureau" will send out highway spokesmen, disguised as legitimate lecturers, to attack the ecology movement. Their speeches will be carefully written for them by the lobby. Its chief propagandist, John Gibbons, estimated in a confidential memo that "at least half a dozen 'different' speeches" would have to be written. These canned speeches are supposed to provide a "hard-hitting, name calling refutation of the current highway myths." The reason for naming adversaries, Gibbons explained, is to attract attention. "Only this invitation to controversy," he wrote, "can be expected to get the attention of the media which is desired."

The HUFSAM campaign would focus on cities "where conservationists have been most effective at stopping the encroachment of highways and freeways," according to Anderson. He quoted Gibbons as saying:

> Forces are building up both inside the federation and outside, which demand we do something big and now to counteract the constant bombardment of highway critics.

The lobbyists would focus on name-calling environmentalists who talked about "air pollution; land use; destroying urban life; the evil highway lobby . . . housing dislocation; and assorted ecological (subjects) involving parks, wildlife, natural resources, etc." [Anderson, Jack, "Road Lobby to Assail Ecologists," *The Washington Post*, September 25, 1971]

One of the surprising new factors working against highways, both in project development and as a subject for media debate, was the National Environmental Policy Act of 1969 (NEPA), signed by President Nixon on January 1, 1970. At the time of passage, Congress, the President, and most observers thought its main provision was creation of the Council on Environmental Quality (CEQ). Instead of waiting for environmental disasters and then reacting to them, CEQ was intended to plan how to avoid problems before they occurred or turned into catastrophes. Little notice, even during debate in the House and Senate, was paid to the "action-forcing mechanism" that would soon be known as the environmental impact statement. By requiring a review for each major Federal action, NEPA provided an opening for opponents to take State highway agencies and FHWA to court to block projects under the Administrative Practices Act.

Opponents had been using environmental laws in the courts to block highway projects, but NEPA transformed the opposition. Environmental groups with attorneys took over project opposition from property owners who had led the battles of the 1960s. FHWA's Kussy recalled the transition:

> The evolution of NEPA from a short, seemingly innocuous charge to generally consider the environmental consequences of federal actions, to the procedurally precise, overarching requirement that it has become is one of the major events in environmental law.
>
> To underscore how unexpected the development of NEPA really has been, it does well to consider that at the time of its enactment, congress estimated that the cost of NEPA, including the amount of staff time needed to implement the act governmentwide, would be $1 million/year. When I began my legal career with the Pennsylvania Department of Transportation in 1971, major environmental litigation under NEPA was just starting, and the department's initial way of improving its NEPA documents was to hire a science writer. The environmental staffs that soon became the norm were only beginning to be set up. NEPA became effective on January 1, 1970. However, by administrative action, FHWA sought to delay its effective date for 1 year. This resulted in a lawsuit that was settled by requiring literally hundreds of documents to be prepared to make up for the delay.

At the time of Kussy's presentation, approximately 6,000 cases had been filed under NEPA, with roughly 10 percent of them involving the Federal-aid highway program. [Kussy, p. 12]

(For the origins of NEPA and how FHWA and the State highway agencies implemented it, see "Addressing the Quiet Crisis: Origins of the National Environmental Policy Act of 1969" at http://www.fhwa.dot.gov/highwayhistory/nepa/index.cfm.)

To bolster its case, HUFSAM published a 40-page brochure by Peter G. Koltnow called *Successful Cities* citing Grand Rapids, Milwaukee, Phoenix, San Diego, Tulsa, and Winston-Salem for the way they addressed their transportation problems. A brief review of the pamphlet in the November 1971 issue of *The American City* said of the cities:

> All apparently have a vigorous state freeway program, a traffic engineering [sic] that is considered good, control over operation of the arterial street systems and a stable and competent staff. Mass transit is not a prime consideration in these success stories—unfortunately. [Book Reviews and Report, *The American City*, November 1971, p. 58-59]

Two AASHO panels, held a year apart at annual meetings, illustrate how highway supporters viewed the shifting ground. During AASHO's November 1970 annual meeting, one of the featured events was a panel discussion with Members of Congress, including Representatives Fallon and Kluczynski. Virginia's Douglas Fugate, AASHO's outgoing president, moderated the discussion. He asked several questions about the Federal-Aid Highway Act of 1970, then pending in Congress. More broadly, he asked:

> In your opinion, is there any probability that Congress will yield to the anti-highway pressure and start cutting back on the program with highway revenues being diverted to finance other modes of transportation, and if there is to be a total transportation fund, will revenue sources from other transportation modes, in pro rata amounts of the respective needs, go into such a trust fund?

Representative Kluczynski reassured AASHO:

> I do not believe that Congress will yield to anti-highway pressures . . . . Down the road we may have a so-called total transportation fund. If such develops, however, I would believe that the programs placed in it . . . will retain their separate identities and that the Highway Trust Fund would continue to exist as a separate entity in a total transportation fund. [*American Highways*, January 1971]

A year later, on the eve of consideration of the next 2-year reauthorization legislation for the Federal-aid highway program, the highway community knew its foes had become stronger. On December 6, 1971, AASHO held a similar panel during its annual meeting. In an opening statement, Representative Harsha pointed out that "highway critics seem to be growing not only in intensity and volume and activity but they are also developing rather ingenious methods with which to invade the Highway Trust Fund." In part because of the media's focus, 1972 would be "a very crucial year for the Federal-aid highway program." The anti-highway attacks were having their effect, he said, and Members of Congress "who have not been aligned heretofore with the anti-highway coalition, now seem to be aligned with it."

In his view, 1972 would be "a year of reckoning insofar as a so-called 'after '75 highway program' is concerned." He added:

> As I say, if we do not do it next year it may be two or more years before the legislation can be considered, and this gives the opponents of the highway program an opportunity to enhance their ranks and to increase their arguments. [*American Highways*, January 1972]

The Highway Action Coalition agreed, as Kheel explained:

> At long last, Americans are becoming aware of a new version of crime in the streets: The pollution of our cities and carnage on our highways. I mean the distorted governmental preference for the auto and the dominance of highways in federal transportation policy. ["Ecologists Attack the Highway Trust Fund," *Business Week*, December 11, 1971, p. 8]

Thwarting the Will of Congress

Even as President Nixon sent the transportation revenue sharing proposal to Congress, he revived the hard feelings about impoundment. Appearing before the House Appropriations Committee in late February, OMB Director Shultz released a preliminary estimate that the Administration would impound $8 billion, mostly in domestic funds. While Members of Congress and interests affected by the likely freeze criticized the action, Senator Ervin's Subcommittee on Separation of Governmental Powers held hearings on the issue.

On March 23, 1971, former Secretary of the Interior Steward L. Udall appeared before the subcommittee to urge Congress to force "a confrontation with the President" on the practice. Chairman Ervin agreed the practice was objectionable, whether the President was Republican or Democratic. He said that $12.2 billion in appropriated funds were being held up. ["Nixon Asks $8 billion Added Funds," *The Washington Post*, March 24, 1971]

The Senator's total included $5.5 billion in highway funds. When Federal Highway Administrator Turner appeared before the subcommittee that same day, he described previous actions, including the most recent:

> On September 4, 1969, President Nixon directed a 75 percent reduction in new construction by the Federal Government. Also, the President urged the States and local governments to follow the example of the Federal Government by cutting back temporarily on their own construction plans.

After pointing out that the States initiated Federal-aid projects, Turner continued:

> No further steps were taken to prescribe a specific curtailment of the Federal-aid highway program, pending developments in connection with the voluntary action of the States in complying with the President's request.

He explained how FHWA implemented impoundments:

> The control step that we take within FHWA is to defer the letter authorizing the State highway department to advertise for bids. We set maximum limits on the total amount of new obligations which the State would be permitted to enter into within a given period of time–usually on a quarterly basis . . . . I would like to emphasize that no limitation has lasted long enough to affect any lapsing of funds . . . .

Turner mentioned the Missouri lawsuit and pointed out that the authority for impoundment of Federal-aid highway funds had been addressed in two major legal opinions in recent years:

> The first was by the Comptroller General. Senator Randolph and Representative Fallon, former Chairman of the House Public Works Committee, asked the Comptroller General [Elmer B. Staats] for his opinion of the legality of the 1967 limitation. The Comptroller General replied on February 24, 1967, in opinion B-160891. He emphasized that the opinion was advisory only and was binding on no one. The Comptroller General advised that he found the limitation to be legal as a proper exercise of executive authority [and] so long as the executive did not reduce already outstanding Federal obligations (which no limitation has done), it had no duty to spend all that Congress appropriates or authorizes to be obligated.
>
> The other opinion on this matter was issued by the Attorney General [Ramsey Clark] on February 25, 1967, in answer to the Secretary of Transportation's request for a clarification of the legal issues involved. The Attorney General upheld the legality of the limitation as applied to the Federal-aid highway program, at least insofar as the limitation did not affect Federal obligations already outstanding.

On March 24, OMB Deputy Director Weinberger appeared before the subcommittee to defend the President's right to impound funds. He described congressional appropriations as "a direction to be followed whenever it's possible to do so" and said that impoundments were "not a means by which the President attempts to thwart the will of Congress." The President could not be expected to automatically spend every appropriation; he "has to be more than a rubber stamp or a messenger boy running over to the Treasury." The goal was not to thwart Congress but to keep spending and borrowing within limits to economize or fight inflation. In some cases, the constitutional requirement that the President "take care that the laws be faithfully executed" might require him to impound funds, but it was not a responsibility, Weinberger said, "to be taken lightly, nor do we take it lightly." ["Fund Impounding by Nixon Backed," *The New York Times*, March 25, 1971]

The impoundment that Director Shultz had discussed in February turned out to involve $12 billion, including funds for urban construction, dams, water projects, and highways. Citing the President's war powers, his general authority under the Constitution, and specific language of the 1951 Anti-Deficiency Act as justification, the Administration said it was taking action to combat inflation, particularly in the construction industry, and stay within congressional limits on the size of the public debt and on Federal outlays for the current year. In addition, according to an OMB source, about $10 billion was being withheld as a matter of policy because the Administration opposed the spending at this time.

A *Washington Post* article about reaction to the impoundment reported:

> But the withholding has brought angry criticism from men like House Speaker Carl Albert (D-Okla.), Senate Appropriations Chairman Allen J. Ellender (D-La.), Chairman Joe L. Evins (D-Tenn.) of the House Public Works Appropriations subcommittee, and Sens. Sam

> J. Ervin Jr. (D-N.C.) and John J. Sparkman (D-Ala.). In comparison with [previous] freezes, they complain, the amounts being withheld by Mr. Nixon are unprecedented.

Senator Ervin considered the action "an unconstitutional assertion of the right of an item veto." Critics suspected the freeze was bait for enactment of revenue sharing or a slush fund to be released in 1972 to pump up the economy and the President's reelection hopes. Senator Ervin was planning legislation to require the president to report any proposed impoundment to Congress and giving Congress 60 days to veto any such presidential proposal. (As noted earlier, a version of the legislation would be enacted in 1974.)

On August 31, 1971, Secretary Volpe announced three steps, including release of $400 million in impounded highway funds, "to increase highway safety and stimulate jobs in areas of high unemployment." He also released the regular FY 1972 second quarter Federal-aid highway funds, totaling $1.145 billion, and authorized the FY 1973 apportionments to the States early to allow States that had used their FY 1972 funds to get an early start on FY 1973 aid.

Troubled Transit

As 1971 began, AASHO President and Wisconsin State Highway Engineer W. J. Burmeister had a message for the highway community:

> One can't help wondering "what should be the position of AASHO toward solving our future transportation problems, particularly in these urban areas."
>
> Obviously, AASHO can't solve the problem alone, but can help show the way through cooperation with organizations involved in complementary transportation systems, through an informed Congress and State Legislatures, and through an earnest effort on the part of the member departments to fully inform the public of the need for a completely integrated transportation system. Highways certainly will play a vital role in whatever form our future transportation needs dictate . . . .
>
> Speaking for AASHO, I would urge everyone involved in highway development, and especially the member departments, to be cognizant of our responsibility to recognize the social and economic impact of highway development, to continue to give due recognition to ecological and environmental features, and to keep the public fully informed of the need for continuing highway development in both the urban and rural areas to complement total transportation. By so doing, we can gain the public acceptance so vitally necessary to permit completion of the 42,500-mile Interstate System, to improve the most vital sections of the Primary and Secondary Systems, and to develop an Urban System to provide the traffic circulation so essentially necessary to the urban areas. [Burmeister, W. J., "Looking to 1971," *Better Roads*, January 1971, p. 37-38]

Even as the highway community tried to regain public support, State and local officials around the country were desperately seeking ways to pay for urban mass transportation systems that could not pay their way through farebox collections. New York City, the Nation's leader in mass transit, illustrated the problem, as *The New York Times* reported in March:

> The 2.5 million people who ride the subways, buses and commuter railroads to and through New York City each weekday will pay $150-million less this year than it costs to run the transit systems.
>
> Next year, transit officials estimate the deficit, attributed to rising costs and declining patronage, will increase by at least 40 per cent. For now, the officials say they do not know where they will get the money except by increasing fares sharply.
>
> Virtually all of metropolitan New York's major mass transportation lines are in financial straits. The Transit Authority faced a 1971 operating deficit of at least $100-million. Before Jan. 1 it will enter tough negotiations with transit workers that could drastically increase this deficit in 1972.
>
> The city transit fare—which rose from 20 cents to 30 cents just 14 months ago—seems certain to climb to 40 cents or more Jan. 1 unless the Transit Authority can find approximately $150-million in new subsidies beyond the more than $125-million that it now receives in indirect subsidies from the city and the Triborough Bridge and Tunnel Authority. [Lindsey, Robert, "Transit: Ink Gets Redder," *The New York Times*, March 8, 1971]

Metropolitan areas around the country faced variations of the problem, with all seeking ways to pay operating expenses, preferably without raising fares or taxes. One option the States considered was bond issues, but they came with a price, as a *Times* editorial pointed out:

> New Yorkers will be given a Hobson's choice later in the year in the form of a transportation referendum without alternatives. If they want to approve a bond issue, they will have to sanction a split that apportions $1.35 billion for mass transit but $1.15 billion for highways. A voter may feel that the former is a dire necessity and the latter a largely wasteful blight on the land, but he will have to take both or neither.

The price of highway funding was extracted by legislators representing upstate districts outside the metropolitan area. The editorial lamented the choice:

> A procedure that can give the people of this state the mass transit they need only if they resign themselves to more of what they don't need—destruction of the countryside, air pollution and waste of natural resources—is a procedure in need of drastic re-examination. ["What Price Transit?" *The New York Times*, July 16, 1971]

As the November 2 vote approached, Governor Nelson Rockefeller and Mayor John Lindsay, both liberal Republicans but often at odds with each other, launched a last-minute all-out drive to save the referendum, which polls indicated was doomed. Thomas Kheel led the opposition. He contended that the State was already $7 billion in debt and could not afford the additional burden. In response, Governor Rockefeller called Kheel a "political exhibitionist."

The voters defeated the bond issue by a wide margin, with upstate opposition combined with surprising defeats in the New York City boroughs of Brooklyn, Staten Island, and Queens. The Governor said, "There's going to be a lot of suffering in the state because of this," with transit upgrading and highway projects threatened. The defeat also left Governor Rockefeller's plan to build a bridge across Long Island Sound from Oyster Bay to Rye without a source of funds. [All from *The New York Times*: Lynn, Frank, "Fate of Bonds Shaky in Tomorrow's Vote," November 1, 1971; "State Bond Plan the Major Issue for Voters Today," November 2, 1971; "State Transit Bond Issue is Voted Down Despite Rockefeller-Lindsay Campaign"; and Prial, Frank J., "Rockefeller and Lindsay Differ on Ways of Saving Transit Fare; Bond Loss Deepens Fiscal Crisis," November 4, 1971]

On January 5, 1972, the city increased the subway fare from 30 cents to 35 cents.

Transit systems in other big cities were facing similar problems. Chicago Mayor Daley discussed the issue in a speech before the 3-day Fifth International Conference on Urban Transportation in Pittsburgh in September 1971:

> I know [I speak for] all mayors in not questioning the need for building highways, but we do question the priorities they have received and more important, what they continue to receive. The preferential treatment for highways should be ended, especially since it appears that the future of the expressway system is rather dim without the use of an efficient mass transit system . . . .
>
> I believe that before considering expansion of the interstate highway system we should give realistic federal aid to mass transit systems, including the development of correlatory [sic] facilities, such as parking lots, park-and-ride facilities, new rolling stock for busses [sic], improved terminal facilities, and the improvement of our arterial streets.

He criticized Federal funding levels for transit as well as the view that the "users of mass transit should assume the whole burden of paying for it, and if mass transit could not compete with the automobile, that was just too bad." He regretted that the President and OMB had not approved Secretary Volpe's full recommendation for transit ($900 million instead of OMB's $600 million) and said that "federal financing is not only too little but it fails to provide one of the basic elements we need, the contract authority essential for realistic planning and construction."

James M. McConnon, chairman of the Southeastern Pennsylvania Transportation Authority (SEPTA), criticized President Nixon's decision to eliminate the automobile excise tax, arguing it would put more cars on the road. As reported in *The Journal of Commerce*, he recommended equal matching shares for Federal transportation dollars:

> "There can be no defensible basis," he said, "for federal insistence upon one-third local matching funds for public transportation at the same time only 10 per cent local financing is required for interstate highway construction . . . ."

> Mr. McConnon said that states and cities should utilize their regulatory powers to control and limit urban traffic and promote public transportation. He suggested restricting selected streets and areas for public transport, improving and enforcing parking ordinances, provision of selected bus lanes in multiple lane roads in suburban regions, assessment of special fees for private traffic in some urban areas, and rigid control of through traffic on city center streets. He also asked for an end to federal prohibition against local community collection of tolls on federal roads.

UMTA Administrator Carlos C. Villareal told the conference he expected the Federal Government to obligate $1 billion for mass transit between January 1, 1971 and June 1972. This was possible, because OMB had increased the obligation level to $900 million as Secretary Volpe had recommended. [Creedy, Judith, "Mass Transit Financing Draws Sharp Criticism," *The Journal of Commerce*, September 13, 1971]

Vice President Agnew addressed the conference on September 8 to discuss balanced transportation policy with emphasis on "attractive alternatives" to what he called "do-it-youself commuting":

> I believe we have now learned in this country that transportation is not a matter of either good highways or a good urban transit system. We need both, one tying in with the other, if it is to be an effective system and really move people. And moving people is what it is all about . . . . We should concentrate on the individual and how to best get him from his home to school or to work or to the store or to the sports stadium or theater—at a price he can afford and without taking all day—whether he drives his own car or rides a bus or train.
>
> For too long we thought in terms of having either rapid transit or automobiles and trucks as the backbone of a city's transportation. We now know, as our friends overseas have accepted all along, that it is a combination of both. We cannot eliminate the motor vehicle. But we can reduce the dependence on it by enhancing the attractiveness of other forms of transportation.

The Vice President suggested the cities seeking relief consider Sweden's progress in building new towns in connection with improved mass transit systems:

> What a wonderful opportunity this exciting concept offers for solving the problems of overcrowding people as well as automobiles in our own American cities. The creation of new towns and satellite cities is our best hope for planned urban expansion and relief of many of the problems we now face in the impacted areas of our cities.

He explained that Stockholm had 18 satellite cities, each with a population between 10,000 and 50,000. These were planned cities with a transit line providing easy access to downtown. Sweden, he said, had the highest per capita ownership of automobiles outside the United States, but 90 percent of its inhabitants reached downtown Stockholm by the transit system.

He reported that the Nixon Administration had doubled mass transit expenditures to $435 million in 1970, and that figure would reach $900 million in 1971. He pledged the Administration's continued support of urban mass transit systems, which he said could play an important role in developing "new towns and satellite cities."

This emphasis on mass transit did not mean the Administration was going to ignore highways. Mass transit systems were needed in urban areas, but highways remained vital. "The automobile is still man's best method of personalized transportation and it can continue to serve that purpose for many years to come if we lick the pollution problem and if we keep our highways and streets open."

Earlier that day in Pittsburgh, Secretary Volpe had announced a $60 million UMTA grant to the Allegheny County Port Authority for Skybus. It was an innovative transit concept developed by Westinghouse Electric Corporation of Pittsburgh. The plan involved a fleet of driverless, rubber-tired electric transit cars operating under remote control on a 10½ mile roadway, most of it elevated, between Pittsburgh and South Hill Village. The project included two exclusive roadways totaling 12½ miles for commuter buses and improvements to two streetcar lines. The grant, Secretary Volpe, was the largest ever made to a local mass transit system, and he pledged up to $155 million in total grants for the $228-million project. [United Press International, "Agnew Says Transit Can Save Cities," *Youngstown Vindicator*, September 9, 1971; "The Vice President on Transportation," *The Washington Post*, September 12, 1971; Lindsey, Robert, "Pittsburgh Given Federal Grant for Automated Transit Project," *The New York Times*, September 9, 1971]

(As news coverage of the Volpe announcement made clear, Skybus was controversial. The Port Authority board supported Skybus but was divided on the plan, as was the County Commission. Mayor Peter F. Flaherty opposed the project. Opponents argued that available funds should be used to improve existing railroad lines, not on an untested concept. In 1975, with the estimated cost of the initial project up to $400 million, Governor Milton J. Shapp withdrew his support and the Skybus plan came to an end. Although local officials hoped to use the Federal funds for other transit projects, UMTA withdrew the $60 million awarded in September 1971.

(The Stockholm model cited by Vice President Agnew was a well-known urban planning concept that contrasted with the model adopted by BPR in its reports to Congress on *Toll Roads and Free Roads* (1939, which included the first attempt to describe what became the Interstate System) and especially in *Interregional Highways* (1944, which refined the masterplan described in 1939). The BPR model involved a series of circumferentials, including one around the central business district, and radials linking the circumferentials as part of a plan to relieve congestion and revive city fortunes. Sven Markelius's General Plan of 1945-52 for Stockholm proposed a balanced transportation system that included a high-capacity circumferential supplemented by a new subway system built in radials outward from downtown. The city had been buying unoccupied land as early as 1904 and, by the time of the Markelius plan, owned virtually all such land within the city limits. That land was the ideal location to solve the city's severe housing shortage. Professor Peter Hall described the result:

> During 1945-57 the first Tunnelbana [subway] line was built and, based on it, the first satellite grouping at Vällingby was completed. It took the form that was to be repeated in every subsequent case: a central high-level shopping and service centre . . . serving 80,000-100,000 people, was supplemented by local district centres; all were connected by the

> subway; residential densities were highest around the major centre, high around the local centres, progressively lower away from the centres, so as to bring the maximum number of people within walking distance of shops and services, implying that nearly everyone would be housed in apartment blocks. This standard prescription varied only slightly through the 1950s and 1960s, reflecting changes in fashion and the fruits of experience: very high high-rises around an open pedestrian mall at Farsta, with three times the car-parking that had been provided at Vällingby; a tighter, more enclosed pedestrian mall and low-rise high-density apartments at Skärholmen, with a further expansion of parking into a vast multi-storey [sic] garage for 3,000 cars, the biggest in Scandinavia; an enclosed mall, with direct access into the subway station, at Mörby.

(Urban planners who came from the United States and other countries to see this concept in practice were impressed:

> And, a visiting sociologist found, in the classic early satellite of Vällingby most people seemed well content: as compared with American suburbanites in Levittown the men had more time with their children, the women and teenagers found it easier to get around without a car, the children had better-planned open space and special services. Even then, polled, most said that they would prefer a house to an apartment: a conclusion that the sociologist, clearly moonstruck by the quality of Stockholm life, felt must reflect a fault in the poll. [Hall, Peter, *Cities of Tomorrow: An Intellectual History of Urban Planning and Design in the Twentieth Century*, Basil Blackwell, 1988, p. 310-311; the visiting sociologist was David Popenoe (*Suburban Environment: Sweden and the United States*, University of Chicago Press, 1977, p. 177-201, 236)]

(These concepts were influential in the United States, but that poll was not flawed. As car ownership increased, it affected the willingness to continue expanding based on the Markelius plan:

> In Sweden, single-family homes zoomed from 32 per cent of new housing construction in 1970 to 55 per cent in 1974 and to over 70 per cent by the late 1970s, responding to individual preferences that showed as many as 90 per cent of Swedes preferring houses to flats [apartments] . . . . So the car in Europe, as in its first homeland, was an agency of suburbanization. [Hall, p. 315])

The issue of a transportation trust fund reached the President during a question-and-answer session before the Economic Club of Detroit on September 23, 1971. Robert F. Hasting, the head of architect/engineering firm Smith, Hinchman, and Grylls Associates (now SmithGroup), asked:

> Mr. President, the American Institute of Architects is preparing recommendations for [a] national urbanization policy which we believe is compatible with your national growth policy. Central to our recommendations is the use of a national transportation [trust fund] to implement such a policy. Would you, Mr. President, feel disposed to support a proposal that the Highway Trust Fund expand into a general transportation fund in order to build such a national transportation system?

The President replied:

> Mr. Hastings, as you are probably quite aware, you have hit upon about [sic] one of the most sensitive political issues we have in this country. I just met with a group of Governors, incidentally, enlisting their support, and we have their support in support of the wage price freeze.
>
> If there is one sensitive issue, Governor [William G.] Milliken [of Michigan] will tell you in his State it is: "What are you going to do about that Highway Trust Fund?" The same is true with regard to the Congress.
>
> On the other hand, looking toward the future, looking toward a comprehensive transportation policy for the country, I believe that we cannot be rigid with regard to the Highway Trust Fund. I believe that if the only effective way of solving our mass transit problems, our problems of congestion and the rest, is through some approach which would use some of these funds in other directions, I think we have to consider it.
>
> I don't have a specific proposal before me and until I have one, I, of course, will not approve it. But I don't think we should enter this problem with a closed mind.

Although the President was noncommittal, his references to not being rigid about the Highway Trust Fund or approaching the issue with a closed mind were encouraging for diversion supporters.

Efforts to crack open the Highway Trust Fund were intensifying. On behalf of the Highway Action Coalition, Kheel observed during National Highway Week in September that his organization was determined to “bust the highway trust fund”:

> We are determined to take on the most powerful lobby the country has created—the automobile industry, insurance and real estate companies, the road builders and construction industry, the oil companies and all of their cohorts at the Federal Highway Administration.

The group had only about $500 to work with, but said in a statement:

> The greater our distorted commitment to the private auto, the greater the inconvenience and discrimination experienced by the vast numbers of Americans who either cannot or will not drive. There are more than 110 million wage earning heads of households who have incomes under $4,000 a year. A fifth of all American families do not own a car and over 100 million Americans do not have drivers’ licenses.

The coalition wanted a moratorium on urban freeway construction as well as “the interstate system be declared completed and stopped now.” Speaking of the Highway Trust Fund, Kheel said, “We must begin to use this fantastic resource in cities and states for the kind of transportation that serves people, not machines.” [“Kheel: Block Road $,” *The New York Post*, September 23, 1971; Kole, John W., *Milwaukee Journal*, September 26, 1971]

On September 23, the Senate Committee on Commerce held a hearing on three transportation bills. Chairman Magnuson introduced the first bill, which authorized the Secretary of Transportation to provide for comprehensive regional planning and development of transportation (S. 2279). Second was Senator Kennedy's bill from the previous Congress to establish a national transportation trust fund, now numbered S. 295. The third, S. 1344, would establish a national transportation trust fund, but also call on the Secretary of Transportation to formulate a national transportation development plan that considered the views of representative public organizations and included a formula for allocating funds among the modes.

Senator Kennedy, the first witness, urged the committee to combine the best features of the three bills: a national transportation trust fund; comprehensive multimodal regional planning; and "a system that insures an allocation of Federal funds in proportion to the critical transportation requirements of this Nation in this decade, with the first priority being adequate funding to the transportation needs of the urban areas." Under the present "hydraheaded system," the "signs of major illness within our transportation system are not hard to discover." The signs included the fact that the Federal Government "spent $3.3 billion on interstate highways last year, yet nearly every major public transit system lost millions of dollars and their pleas for Federal assistance to cover right-of-way maintenance went unheeded." No State or region could develop a comprehensive plan for allocating resources:

> The Federal Government, through law and practice, has prompted a rigid misallocation of resources as a side effect of its attempt to stimulate the construction of an Interstate Highway System and long-distance air travel.
>
> It is to end this distortion and to permit a flexible response to changing conditions that I strongly urge creation of a national transportation trust fund.

He acknowledged that the benefits of the Nation's highways were "enormous," but cities could "no longer afford to give up two-thirds of the land to the accessories of the automobile, to the highways, to the roads, to the parking facilities."

He summarized the sources of revenue for his proposal, namely the existing trust funds and the 7-percent excise tax on the purchase of new automobiles, for an annual total of about $8 billion. To receive funds from the new trust fund, each State must have a single transportation agency that designs comprehensive, multimodal, statewide transportation plans that cover urban areas over 50,000 population. He suggested that the final bill "spell out in detail the requirement that the pass-through mechanism assure adequate funding within the State to urban areas, permitting them block grants to carry out their comprehensive transportation plan." Through this same pass-through mechanism, urban areas should receive funds for comprehensive transportation planning.

The goal was to rectify the fundamental problem of the past 15 years:

> [The] States and cities have a simple choice foisted upon them by . . . Federal legislation: build highways or build nothing. They are lured by the availability of 10-cent Federal dollars, if they build highways. And so they build highways and the Nation's changing transportation needs go unmet.

He concluded his statement to the committee by saying:

> Mr. Chairman, we have seen the failures of separate transportation planning and single mode financing in the past, and the time is long overdue for a coherent national transportation policy which will remedy these failures. I believe the enactment of legislation incorporating comprehensive, multimodal planning at regional, State, and local levels and the creation of a national transportation trust fund would place this Nation on the path to resolving its transportation needs in the coming decade.

Senator Howard W. Cannon (D-Co.), who chaired the hearing in Chairman Magnuson's absence, said that he had helped create the Airport and Airways Trust Fund and recalled "the battles that we had [in order] to get as far as we did." As an example, he said:

> One of the concessions we had to make was the elimination of airport access roads as being eligible under the Airport-Airways Act. We had to concede on that to try to get something, and we have even yet not enough funds to keep up with the development of the airports and airways themselves.

He recalled this struggle as a preface to this comment to Senator Kennedy:

> So I think we would have a very difficult time in trying to combine everything into one trust fund, the so-called users' trust fund, to make this type of a broad pool, let's say, to solve all the needs out of one budget. I think we would have a very difficult time legislative wise.

He asked if Senator Kennedy "as a practical matter" thought he "could actually sell to people" the idea that they should pay for one mode of transportation but the revenue should be used for other modes.

Senator Kennedy suggested that consumers paying into the Airport and Airways Trust Fund might be convinced that "the most difficult part of flying from Boston to Washington is in getting from his home to Logan Airport." If the consumer could be convinced of the value of using mass transit to get to and from the airport, "then I think they would be willing to have airport taxes go to mass transit." Another argument might be to point out that "those that live in the urban areas wonder why only $1 out of every $2 in highway user taxes collected from them comes back to the cities." By pointing out such inequities, he thought public support might grow for a single transportation trust fund. [*National Transportation Act of 1971*, Hearing before the Committee on Commerce, United States Senate, 92nd Congress, 1st Session, September 23, 1971, Serial No. 92-87, p. 67-73]

Senator Kennedy based some of his comments on transportation in Boston. Governor Sargent, who appeared before the committee later that day, reinforced Senator Kennedy's observations. He explained that the National Governors' Conference had adopted policy positions during a meeting in Puerto Rico a week earlier. He emphasized two of the positions. "States should continue to establish departments of transportation to provide for consolidated and coordinated transportation policy." In addition, Congress should create a single unified transportation trust fund "to give the

Governors the authority to transfer funds among various programs to meet their States [sic] transportation needs in addition to special revenue sharing for transportation."

The National Governors' Conference had supported a unified trust fund for several years because it would allow give each Governor the "option of spending their transportation allocations in areas of vital need, be it mass transit, airports, or highways."

The National Governors' Conference opposed S. 2279 "as it permits the creation of regional authorities that could in effect supersede the Governor in defining each State's transportation priorities." Governor Sargent explained:

> The State role in transportation planning and implementation is of major importance, both technically and financially, as States attempt to develop comprehensive programs to meet the current needs of society . . . . The States' awareness of the complex issues in the transportation field is evidenced by the growing number of State Departments of Transportation . . . . Because of the comprehensive approach needed, the Governor and the State must play a very active role in meeting these responsibilities. To shackle him with a veto by the local units of government will not provide him with the capability to respond to the needs of a more than small geographic area.

Everyone understood "the difficult problem and the challenge that we face" in trying to "keep our Nation's transportation system not only the envy of other nations, but also totally responsive to our needs." Those needs varied from State to State. "I ask you today to give us the ability and the assistance that is vital in solving our transportation problems." [*National Transportation Act of 1971*, p. 86-88]

Theodore Kheel appeared before the committee on behalf of the Highway Action Coalition. He introduced a lengthy prepared statement for the record, but spent much of his initial comments on the Port Authority of New York and New Jersey. The discussion illustrated how the proposed regional authorities could not be confined within State boundaries or even a grouping of States. Distinctions had to be made, Kheel said, between the transportation of people and goods as well as between short-haul and long-haul transportation:

> The airplane is not in competition with the subway. But the automobile is in competition with the subway and the bus and commuter railroad. Our major crisis is the crisis of cities created by the inability of people to get from their homes to their jobs and back to their homes again.
>
> And when we talk about a balance in coordinated systems of transportation, it is that balance that we have to have because in the last 21 years, since the end of World War II, which really marks the beginning of the automobile age in a big way, and 1949 is really the key year, because it took 3 years for the automobile companies to tool up and get the cars out after the war had ended . . . we have gone on an automobile binge since that time.

His prepared statement indicated that "the crisis in mass transportation must rank at the top of the most serious problems this nation faces." He recognized "the understandable affection for the automobile," but this affection had been "played upon by the promotional skills of the highway lobby." Meanwhile, the Nation neglected "the form of transportation still indispensable to enable most people to get to and from work." The result was that "we face the twin and related problems of congested and polluted streets and deteriorated and deficient mass transportation."

He said the "most dangerous consequence of imbalance in transportation policy is the decline of public transportation systems." While transit companies went out of business and public lines operated at a loss, the Nation was "subsidizing the automobile commuter by an amount at least ten times as great as the subsidies occasionally provided the users of mass transportation." The situation was not only unfair but "self-destructive." He continued:

> At long last, however, Americans are becoming more aware of a new version of "crime in the streets": the carnage on our highways, the pollution of our cities, the destruction of our parks and open spaces, the disruption of neighborhoods and another item on the list of discriminations against the poor, the young, the old and the minorities. I refer to the distorted government preference for the automobile in American life and the dominance of highway building within federal transportation policy.

In the Interstate era, the Nation forgot about social costs. "We have covered our land with concrete ribbons designed to transport vehicles from one point to another." The rural segments of the Interstate System were "important to facilitate movement from one part of the country to another." However, the result in the cities was "a strangling congestion that threatens the well being of all urban residents." Further, he said:

> In all of this road building and planning we have forgotten that the objective of a transportation policy is to move people and goods, to provide a healthy environment in our cities, to enable the development of communities and their economic base with the least disruption, to assure people the means of getting to work.

Now, nearly 20 years later, "we have paid a high price." Kheel outlined the costs. We had created a society dependent on the automobile. The superhighway and the automobile had helped create "sprawl city." We have overlooked those without a car, including the young, the disabled, and the elderly. And far from "paying for themselves" as the highway lobby always claimed, roads imposed great costs on the States and especially the cities for such services as maintenance, traffic police, courts, and ambulance services.

The Urban Mass Transportation Act of 1970 was intended to rectify the imbalance, but "the response by the Administration has been to talk it up in public and cut the budget in private." Last year, he said, OMB had allocated only $400 million of the $600 million the legislation authorized. And while the Administration and Congress ignored the promise of a 5-year, $3.1-billion program, the Highway Trust Fund had grown from $1.482 billion in 1957 to a "whopping total of $5.469 billion in 1970."

Instead of commenting on the three bills under consideration, Kheel's statement summarized the Highway Action Coalition's plan for balanced transportation. Item #1 was that Highway Trust Fund revenues "must be made available for any valid ground transportation use" and "should be expanded into a Transportation Trust Fund." Since 50 percent of the revenue comes from cities, a comparable amount must be made available to cities. In addition, the Interstate System "must be declared completed and stopped now."

Transportation must be democratized by encouraging citizen participation. The resulting metropolitan and statewide plans muct be approved by the appropriate political officials at the local or State level. In addition, transportation planning should consider not only transportation options but their environmental, social, and economic costs; the new Transportation Trust Fund must pay these costs, including operating costs. Parks and wilderness areas must be protected, with the "burden of proof in this land use debate . . . shifted from the citizen to the would-be highway builder." Further, "Citizens must have the right to go to court and enforce the new law."

Cities should be able to levy tolls and taxes on highway use as well as parking facilities. Taxation of trucks must be increased to pay their fair share and no changes in truck size and weight limits should be approved. [*National Transportation Act of 1971*, p. 96-106]

(The committee would hold additional hearings in 1972 on March 16, April 10, and May 5.)

The Boston Revolt

The 1939 and 1944 reports to Congress on the Interstate System described the needed interregional express highway network, but also the urban expressways that would address urban problems such as congestion, suburbanization, and deterioration of housing stock around the city core. A series of circumferential highways, beginning with an inner belt around the central business district, and arterial links among them were the key. Urban planners in the 1940s and 1950s developed plans for such a network for cities around the country.

The officials who conceived the Interstate System recognized that the urban segments could not, by themselves, relieve congestion. In October 1947, AASHO held its annual meeting in New York City where Commissioner of Public Roads MacDonald discussed progress on the Interstate System. Just 2 months earlier, on August 2, the Federal Works Agency and the Public Roads Administration had designated the rural mileage:

> This network, comprising 37,681 miles of the 40,000-mile eventual extent of the entire system, includes 2,892 miles in cities, forming the principal extensions into and through the connected cities. The remainder of 2,319 miles has been reserved to permit addition in the larger cities of distribution and circumferential routes, essential as terminal connections of the system; designation of this further mileage in cities, now under way, requires the close cooperation of city, State, and Federal authorities.

Although highway transportation would remain "the common denominator in the over-all transportation field," MacDonald encouraged the State highway officials to "invite the active participation of the other transportation industries in the formulation of plans for future development" to establish "an efficient transportation system adequate for its commerce and the national defense."

Except during World War II, MacDonald said, transit volumes had been declining since the 1920s:

> In a large and unfortunately increasing measure, the great tidal movements are inefficiently accomplished in private motor cars. In large but undesirably decreasing part, they are served by mass transit facilities . . . . As we approach the problem of arterial improvement in the cities, we cannot fail to recognize the vastly larger element of mass transit [compared with rural roads] in the urban passenger movement. We shall have to learn to think of mass transit as highway traffic, and as a form of highway traffic especially in need of improvement. Whatever we can do to promote the patronage of mass transit and reverse the past trend toward the preferential use of private automobiles will be a contribution of great benefit in the solution of urban traffic problems. Unless this reversal can be accomplished, indeed, the traffic problems of the larger cities may become well nigh insoluble. We will make this highly desirable contribution only if, in the planning of our urban arterial improvements, we incorporate the special provisions that are needed for the service of express mass transit in its several appropriate forms.

This discussion reflected the data MacDonald's agency, in cooperation with State and local officials had accumulated. Beginning in 1945, the Public Roads Administration worked with State and local officials to develop urban expressway networks in accordance with the concepts described in the 1944 report, *Interregional Highways*. They used origin-and-destination surveys and sampling polls to determine need, then developed networks to meet it.

According to a 1963 report by the Mass Transportation Commission of Massachusetts, "the most extensive field study made to date" began for the Boston area in 1945. Using techniques created by the Public Roads Administration and the Census Bureau for sampling in major cities, the traffic survey use "home interviews within the study area bounded by Route 128 as it exists today, and driver interviews for vehicles at the cordon lines." These techniques were "standard for the period."

Because the field study began in the autumn of 1945, just after wartime gasoline rationing had come to an end, the results overestimated future mass transit use:

> There were 979,000 mass transportation trips in the study area as compared to only 812,000 vehicle trips. The shortage of gasoline and tires as well as the cessation of private automobile production during the war accounted for this transitory pattern.

The Master Highway Plan approved in 1948 formed the "basis for the Boston area expressway system." The 1963 report added:

> In the tradition of highway studies the Master Highway Plan contained a section on public transportation entitled "Coordination With Transit Improvements." Among the items touched upon was the possible use of express buses on the expressways system, particularly

> over the Mystic River Bridge and the Southeast Expressway. All intercity buses were expected to use the Central Artery. Several bus terminals were planned for the downtown area. The report suggested use of consolidated right-of-way for both highway and rail facilities although it made no specific recommendation. Although none of these recommendations were adopted, there has been recent interest in permitting bus service on expressways and in providing joint rights-of-way for highway and rail facilities . . . .
>
> Unfortunately, this report . . . failed to foresee the approaching decline in mass transportation patronage. Traffic volumes were underestimated and mass transit overestimated because no consideration was given to shifts in mode of transportation.

With post-war estimates in hand, the planners believed "that the recommended expressway system would be inadequate to handle future traffic volumes unless these transit improvements were made." [*The Boston Region*, The Boston Regional Survey for the Mass Transportation Commission, April 1963, p. 90-92]

(Federal highway officials worked with State and local officials around the country on similar studies before announcing urban segments of the then-40,000-mile Interstate System in September 1955. For information on these surveys, see "Designating the Urban Interstates" at http://www.fhwa.dot.gov/infrastructure/fairbank.cfm.)

With additional study over the years, key elements of Boston's Interstate and non-Interstate expressway system were refined:

> **Outer Circumferential Highway** – The outer ring, designated I-495, was built in segments from 1959 to 1982.
> **Circumferential Highway** – This second ring, designated State Route 128, was completed in 1959. (It was originally called the Circumferential Highway, then renamed the Yankee Division Highway after World War II to honor the 26^{th} Infantry Division of the Massachusetts Army National Guard.)
> **Southeast Expressway** – Included in the 1948 master plan as a link between downtown Boston and the South Shore/Cape Cod, the 11.8-mile expressway traversed heavily populated sections of the metropolitan area. Construction of the six-lane expressway designated State Route 3 between State Route 128 and Massachusetts Avenue began in 1954 and was completed in June 1959. In November 1975, the expressway was designated as an extension of I-93 in the November 1975.
> **Southwest Expressway** -- Designated I-95, the expressway linked State Route 128 south of Boston with the Inner Belt. Turning east, I-95 formed the last section of the Inner Belt before crossing Boston Harbor via the planned Third Harbor Tunnel into East Boston. Across the harbor, I-95 continued north out of the Boston area, eventually crossing the Circumferential and Outer Circumferential Highways.
> **Inner Belt** – This route, designated I-695, connected the Southeast Expressway, Southwest Expressway, I-90 (Massachusetts Turnpike) from the west, and I-93, which entered downtown from the northwest on the 1950's era elevated Central Artery. The Central

> Artery provided the northern end of the Inner Belt while the southern end was to be a short segment of I-95.

A 1962 study of the network within State Route 128 reviewed the physical effects and project costs of the routes still to be built:

> The report has aroused wide interest in the Boston area for at least three reasons. (1) Construction of the recommended expressways would involve traversing the most densely populated portions of the region and would create substantial dislocation. (2) Construction of the projects recommended will require an expenditure of $325 million over a proposed 10-year construction period. (3) Tremendous benefits to the Boston area would result from the completion of the expressway system. [*The Boston Region*, p. 94]

The two most controversial segments would prove to be the I-695 Inner Belt and I-95 in the city. By the early 1960s, problems had begun to surface, as the 1963 regional report acknowledged. It said of I-95:

> Between Route 128 and the Inner Belt, I-95 will probably be completed toward the end of the Interstate program. Several alternate locations have been studied but a number of problems remain unsolved. The large scale land taking involved in construction of the recommended route has already resulted in strong opposition from residents and neighborhood groups. In addition, the precise linkages with Boston urban renewal areas and the possible combination of rights of way for rapid transit and railroad and highway facilities have not been resolved. [*The Boston Region*, p. 113]

As for the Inner Belt, it had "been the subject of a great deal of controversy" and "progress has been slow." Only a half-mile section was under design and another 1.3-mile section was in the surveying and mapping stage:

> In 1960 the State legislature passed a bill giving certain communities a veto power over the location of the route within their jurisdictions. These communities include Cambridge, Somerville, Brookline, and Boston, the four to be traversed by the Inner Belt. While Boston initially agreed to a tentative location in Charlestown and Roxbury, Brookline, Cambridge and Somerville have objected to the proposed route because of the anticipated disruptive effects on established neighborhoods and have effectively used the veto power to block construction. Cambridge and Somerville officials have protested that in its recommended location the route would require extensive land takings which would remove substantial amounts of taxable property and dislocate about 4,000 families.
>
> It can be assumed that eventually a workable solution will be found to the Inner Belt location problem. However, as a result of delays it will probably not be completed until the 1970-1975 period, although some segments, particularly those in Boston, may be completed sooner. [*The Boston Region*, p. 114]

By the time of the 1971 book *Rites of Way: The Politics of Transportation in Boston and the U.S. City*, the authors described the routes in starker terms. The Inner Belt "had been academic" for 8 years since its inclusion in the 1948 Master Highway Plan because the State and city did not have the funds to build it. However, when it was included along with the I-95 Southwest Expressway as part of the Interstate System to be built with 90-percent Federal "cost to complete" funds under the Federal-Aid Highway Act of 1956, planning began on the Inner Belt:

> Once the federal money was assured, the Belt was subjected to years of squabbling, at first between road-building agencies and later among planners, residents, politicians, and agency heads. But most people were really fighting over how and where the road should be built. Very few at first were questioning the need for the road.

As for I-95:

> It would run through the predominantly white working- and middle-class communities of Hyde Park, Roslindale, and Jamaica Plain and would join with the Inner Belt in the black district of Lower Roxbury in a five-story interchange . . . .

The authors continued:

> About 43 percent of the families directly affected by those two roads were financially eligible for public housing, but no public housing was being built for families . . . .
>
> I-95 would connect with the Inner Belt in an eight-lane interchange, taking up thirty-five acres in the shadow of two public housing projects, three planned low-income developments, and a campus high school in Roxbury. Ultimately, an estimated 160,000 cars a day would use that interchange, and no studies existed to indicate what the effect would be on the health and well-being of the residents and school children. [Lupo, Alan; Colcord, Frank; and Fowler, Edmund P., *Rites of Way: The Politics of Transportation in Boston and the U.S. City*, Little, Brown and Company, 1971, p. 13-14, 26]

Author Dan McNichol, writing many years later, explained the plan:

> [A] stretch of new highway, I-95, was again slated to run straight through the heart of the city. Its beltway, I-695, would create an iron ring around the city's downtown. The new highway would be a partially elevated structure about 10 miles long, nearly four stories high, with 13 interchanges plowing through 18 heavily populated neighborhoods. In concept it was a miniature beltway encircling the business district, a noose around the neck of Boston . . . . Along the path of I-95, hundreds of homes had already been taken and demolished in a working-class Irish neighborhood called Jamaica Plain and in a predominantly black neighborhood known as Roxbury. [McNichol, Dan, *The Roads That Built America: The Incredible Story of the U.S. Interstate System*, Barnes and Noble, 2003, p. 147, 150]

As Commissioner of Public Works and Governor, Volpe had supported the plan. After Governor Volpe became Secretary of Transportation in 1969, Lt. Governor Francis W. "Frank" Sargent became Governor to complete Volpe's term. Governor Endicott Peabody (1963-1965) had appointed Sargent one of five Commissioners of Public Works, in charge of the Division of Waterways, in 1964. Governor Volpe elevated Sargent in 1965 to be chairman. When Governor Volpe proposed a major reorganization of the department, Sargent opposed it. As Kilgore explained, the reorganization "would be too risky at a time when he [Sargent] needed all the support of his department to get the Inner Belt and Southwest Expressway completed on schedule." The Governor was strongly committed to the reorganization but he had to balance priorities:

> Unlike the modern highway departments of California and Texas, the Massachusetts DPW still lacked enough highly skilled personnel to do its own design work and relied heavily on expensive consultants. Faced with a choice between concentrating on the visionary goal of revamping the department and the very real possibility of completing the Inner Belt, however, Volpe chose to push on with highway construction.

The way seemed to brighten in July 1965 when Sargent secured passage of a law abolishing the local veto of Federal-aid highway projects. At the time, he said:

> I don't see how, realistically, the New Boston and several communities can afford not to have these two roads. Without the Southwest Expressway, in four, five, or even ten years time it will be unbelievable—jammed with traffic that will take hours to straighten out. The city will be strangled. [Kilgore, p. 141-142]

As Chairman, Lt. Governor, and now Governor, Sargent had supported the planned highway network. Mayor Kevin White had supported it as well.

Initially, residents in the path of the I-95 and I-695 segments of the Inner Belt were fatalistic as homes were taken and demolished in white Jamaica Plain and black Roxbury. However, beginning around 1967, a coalition began to seek changes—a coalition of home owners, community activists, professors from Harvard and M.I.T., lawyers from the predominantly Jewish suburb of Brookline, and others. First they tried to change the path of the highway. When the DPW refused to move the highway, the coalition began to protest the highway itself, with Mayor White eventually joining the protestors.

By the time Governor Sargent took office on January 23, 1969, Mayor White had reached a decision. He asked the new Governor to withdraw the Inner Belt and Southwest Expressway plans.

On January 25, 1969, just 2 days after taking office, Governor Sargent saw the face of the protestors. The newly formed Greater Boston Committee on the Transportation Crisis (GBC), with the support of the Cambridge and Boston City Councils, organized "People Before Highways Day" on the Boston Common. Lupo described the event:

> There was a ballgame atmosphere to the parade and the rally. The Peace and Freedom Party, ever trying to cement an alliance with the workingman, passed out pamphlets attacking city officials, among others, thereby immediately causing arguments with the working-class protestors. Cambridge Model Cities residents carried a coffin to symbolize

> the death of that program if the Inner Belt were to slice through East Cambridge. One man walked his dog, which wore a banner proclaiming, "I need a belt, but Cambridge doesn't."
>
> Fire Chief William Cremmins, leading a contingent of fifty off-duty Cambridge firemen, said, "Some of the men live in the area. Some of us grew up in those neighborhoods. It's one of the few integrated neighborhoods in America."
>
> Mayor Walter Sullivan flew in a helicopter from Cambridge onto the Boston Common to symbolize the poor traffic situation, which, he argued, would worsen with an Inner Belt. A Democratic state representative from Somerville joined the parade and said her mayor was wrong to support the Belt. A sixty-year-old workingman who forty years before had left County Limerick for America rationalized, "This is a reasonable thing to do. I live too close for comfort to the route. It's all for the outside of Cambridge. Let them wait for a few minutes longer in the traffic."
>
> A young girl carried a sign reading, "Pave Volpe's Bedroom, Not Mine."

Governor Sargent emerged from the State House to address the protestors. He was greeted with boos, but the protestors quieted when he began to speak, as Lupo described:

> At the Common, the rally went on for about an hour before Sargent, tall and tanned, surrounded by aides, emerged to address the throng . . . . He said he too was concerned about "the problems that bring you here today." He said he had called Secretary Volpe—a name greeted by a few boos—and asked that no federal action be taken until he could meet with the protestors . . . . The speech received light applause until Sargent declared, "Never, never will this administration make decisions that place people below concrete." Then they cheered.

He met with community representatives in the State House:

> Through it all, the Governor sat, sometimes fiddling with his fingers, but always concentrating on each speaker. Occasionally, he would ask a question or make a small joke.

At one point, he said:

> "I don't want you to feel when you leave here that all highway construction is ending now, because that isn't the case." Translated into specifics, this meant that the Governor was not about to declare a moratorium on highway projects. Demolition in Roxbury and Jamaica Plain would continue as would work on the Charlestown segment of the Inner Belt.
>
> Sargent closed the meeting at 2 P.M., an hour after it had begun. "Thank you very much," he said, "I've learned a lot. I assure you I'll look into every one of these matters."

Much work remained to be done by the protestors and the Governor:

> But the "People Before Highways Day" had accomplished a number of things. It had brought together diverse groups of people to create a more permanent alliance. It had dramatically demonstrated that the transportation issue was regional and political as well as emotional and technical. It attracted publicity for the cause. It forged links between the protestors and the Governor's office.

(Lupo indicated that, "Unknown to the press and most protestors," Governor Sargent and his staff had been aware of plans for the protest. The GBC had talked with aides to the Governor, who agreed to receive the petitions and listen to the protestors' arguments. [Lupo, p. 42-49]

On February 11, 1970, Governor Sargent appeared on local television for a 10-minute address. Just 4 years ago when he was DPW Commissioner, he said, "Nearly everyone was sure highways were the only answer to transportation problems for years to come." He added, "But we were wrong." He was going to "reverse the transportation policy of the Commonwealth of Massachusetts." He ordered a freeze on property taking along the Southwest Expressway, and called for a study, not just of "where and how to build expressways," but whether to build them. The Southwest Expressway and Inner Belt were among the proposed expressways covered by the new study. [Lupo, p. 106-107]

Kilgore said of Secretary Volpe's reaction:

> Volpe was furious. The land had already been taken, people relocated, and homes destroyed, and Volpe felt the highway and rapid transit line that would have used the same right of way were badly needed to ease Boston's traffic problems. But Volpe could do nothing except remember [State Commissioner of Public Works William] Callahan's prediction that the Inner Belt would never be completed in their lifetimes. Volpe did not speak to Sargent for six months after the moratorium. At last, with Sargent's election campaign imminent, the Massachusetts governor sought Volpe's support. The two men met in Boston and made their peace, but Sargent's reversal on one of Volpe's dearest projects bothered Volpe long after the highway was forgotten. [Kilgore, p. 183]

Sargent was, he would later say, surprised by Secretary Volpe's eventual reaction to the decision:

> I expected more of a screech and a holler than I got. He's certainly changed his thinking about building highways through cities. ["We Need Balanced Funding for a Balanced Transportation System," *Railway Age*, April 13, 1970]

Governor Sargent proposed a change in Federal law that would allow Highway Trust Fund revenues to pay 90 percent of the cost of any kind of transportation facility a State decided it needed. He called the new proposal "balanced funding for balanced transportation," adding that, "if 90-10 money had been available for other modes, I think we'd have a very different transportation system." Among the Nation's Governors, he had found considerable support for the idea, particularly among Governors from States with large cities.

He supported the Nixon Administration's proposed urban mass transportation bill, but preferred a much expanded bill. It was a turning point, he thought, but the Nation must start investing in short-haul and long-haul rail passenger service.

The Governor had met with the State's congressional delegation and found them supportive. Senator Kennedy was notably enthusiastic. Still, Sargent recognized the challenge he faced. "Some steps could be taken this very year," he said, "but to change the whole system would take several years." ["'We Need Balanced Funding for a Balanced Transportation System,'" *Railway Age*, April 13, 1970]

In August 1970, the Governor's Conference considered adopting a resolution embodying Governor Sargent's idea, but decided against it. *Engineering News-Record* explained why:

> Reportedly, governors from rural states overpowered their colleagues from urban states by a tally of 23 to 12 (more showed up later). Also, there was strong pressure from representatives of automotive industries and associations. When the proposal was recommitted to the transportation committees, it's [sic] chairman, Washington's Gov. Dan Evans (R), remarked that the governors "don't need the help of special interest groups" to reach decisions."

Instead, the Governors adopted a resolution saying each State should be able "to transfer, on a limited basis, funds among the various federal transportation trust funds and grant programs to meet his own state's priority transportation needs." They also endorsed "a national public transportation trust fund as part of a flexible transportation fund." This support provided limited backing for Secretary Volpe whose address to the conference had mentioned his concept of a unified trust fund:

> If I don't have the governors with me, I might not be able to tackle it. I might not go to Congress. It will take a lot of persuasion.

He expected to formally propose a unified trust fund later that year. ["Governors Seek Some Discretion in Transportation," *Engineering News-Record*, August 27, 1970]

Two years later, *The New York Times* referred to the efforts in Boston "as a textbook case for similar efforts around the country." It had been a 14-year struggle:

> What began as a handful of concerned citizens in Cambridge grew into an organization that drew ghetto blacks, blue collar ethnics and upper class suburbanites into a coalition and persuaded a Governor who, in 1965 had lobbied against a community veto of highway projects, to privately tell his highway commissioner in 1969: "The old highway building game is over."

The process had been gradual, with politics at the heart. With Governor Volpe moving to Washington, Governor Sargent needed to establish his own political image for the gubernatorial election in 1970, while Mayor White campaigned for the job. The area's academics were influential in gathering information to support the anti-highway forces. While a "community of interest" was forming within the city, the State's decision to route a highway through a wildlife sanctuary in the suburbs brought in conservationists and environmentalists—"the middle and upper class suburbanites who had in existence a powerful lobby at the State Capitol," according to the Reverend Thomas Corrigan, an anti-highway leader. Inside Mayor White's office, his top assistant, Barney Frank, was working with other officials to coordinate relations between the anti-highway lobby and the Mayor.

Professor Alan Altshuler of M.I.T., who participated in the Governor's task force to study area transportation and became the State's Secretary of Transportation (1971-1975), saw the Governor's February speech as "part of a developing commitment on the part of the Governor . . . and, he has slowly come to see the commitment to a balance between the demands of transportation, the demands of the community and the environment as a theme and image for his administration."

The *Times* found that:

> Governor Sargent has now committed himself and his administration to work at all levels—with community groups and local governments, petitions and proposals to the Federal Government, and lobbying with other Governors and state organizations—for the development of a system of transportation that uses highway, rail and air systems in a more efficient balance and to examine alternatives to all these.
>
> "The big question now is: can we meet the real needs of a community for transportation and a decent environment?" asks an aide to the Governor. "We're committed to finding the answer and focusing national attention on the problem." [Kovach, Bill, "Drive in Boston May Bring a New Urban Transit Mix," *The New York Times*, July 25, 1971]

Based on the Boston Transportation Planning Review, Governor Sargent announced on November 30, 1972, that his moratorium on construction of the Inner Belt (I-95 and I-695) would be permanent. He would route I-95 around the city on the existing circumferential, Route 128, while I-695 would be scrapped. Describing the Boston expressways as chains imprisoning the city, he said in a statewide television address that 40 years of reliance on highways had "defeated our own purpose, and we have been caught in a vicious cycle—drasticmore cars meant more highways, which meant more traffic jams, more traffic jams meant the need for more highways . . . ." Worst of all, he said, it hadn't solved the problem that started it all, namely "how best to get from one place to another." [Kovach, Bill, "Mass Transit Plan for Massachusetts," *The New York Times*, December 1, 1972]

To replace the Interstates while addressing area congestion, he preferred a series of measures, as summarized in *The Washington Post*:

> He would upgrade some existing arterials (notably U.S. Rte. 1 to the north), build a circumferential transit line that bypasses downtown, expand and modernize the rapid transit network and rejuvenate the commuter railroad network, perhaps linking the city's two rail terminals.

> He would have the Port Authority build a two-lane tunnel beneath Boston harbor to let taxicabs, buses, limousines and trucks reach Logan Airport, the region's only civilian jet facility. And he would develop a network of satellite airport limousine terminals around the region.
>
> To reduce the incentive for auto travel, he would bar new parking facilities downtown and at the airport . . . .
>
> Massachusetts . . . is proposing to undertake as a deliberate long-range policy the subsidizing of transit deficits. Sargent has proposed to pay half the system's losses, $70 million this year . . . . [Eisen, Jack, "The Boston Freeway Halt," *The Washington Post*, December 24, 1972]

An editorial in *Engineering News-Record* called Governor Sargent's decision "a triumph not only for those who resisted the roads but for the transportation planning process that took into account their views." The decision reinforced "the need for flexible funding for transportation." The editorial concluded:

> As we've said before, a single transportation trust fund will allow each state to determine its own transportation priorities and move ahead with the job of providing better transportation. ["A Victory for People," *Engineering News-Record*, December 7, 1972]

Public Enemy No. 1

Governor Sargent was not alone in abandoning expressways—and the money that came with them. Interstates in urban areas had generated so much controversy that mayors, city councils, and other local officials wanted to reject the highways, but did not want to lose the millions in Federal and State dollars that went along with highway construction.

In Hawaii, for example, opponents of Interstate H-3 through Moanalua Valley as well as local officials were seeking a way to transfer the Interstate funds (then an estimated $250 million) to other transportation purposes. Senator Daniel Inouye (D-Hi.), who first won election to the Senate in 1962, favored a more balanced transportation system. He was, he said, "prepared to introduce legislation" that would exempt Hawaii from the restrictions on the use of Highway Trust Fund revenues. He recalled that the Nixon Administration had given "serious consideration" to the idea of a unified transportation trust fund, but "The idea was shunted aside . . . in favor of a revenue sharing agreement." He continued:

> It is apparent that revenue sharing has very tough sledding ahead of it, and it may be that general legislation to permit the use of highway trust funds for other transportation purposes, which now has considerably [sic] support, may gain even more in the future.
>
> Certainly, state flexibility in the use of these funds would appear to be prudent and desirable, and I shall support that principle.

He was thinking of introducing legislation, but recognized the realities:

> I am informed that similar legislation has been introduced by a large number of members of Congress relative to the trust fund use in their state. To date none of this legislation has received favorable consideration. I am convinced, however, that Hawaii has unique justification for an exception from the present limits of the highway trust fund uses. ["Inouye Backs Protests on Road Fund Limitation," *Honolulu Star Bulletin*, July 28, 1971]

As reflected in the battle over the New York bond issue, officials around the country were searching for ways to pay for the transit facilities they had taken over from the private sector. The universal reality was that transit could not pay its way at the farebox. Raising fares to equal costs would discourage use, especially by the lower income riders most in need of the service. Doing so also would create reelection issues for State and local officials who wanted to go before voters without having to explain fare increases.

A survey by *The New York Times* in late 1971 and early 1972 found that cities around the country were wrestling with the same problem as New York City, although on a different scale:

> Cities around the nation are turning increasingly to special property, sales and gasoline taxes to subsidize soaring deficits on their mass transit systems. With local variations, the same kind of fiscal squeeze facing New York this week, as state and city leaders haggle over ways to keep down transit fares in the face of a mounting deficit, is occurring in communities from Boston to San Diego . . . . The growing losses are prompting lawmakers around the country to turn more and more to the general taxpayer to make up the difference—even though, on the average, less than 10 per cent of the public uses the transit service in most cities.

In Minnesota, the legislature gave the Minneapolis-St. Paul Metropolitan Transit Commission the authority to levy a transit property tax that was expected to raise $5 million to pay operating costs. The Florida legislature allowed Miami's bus system to subsidize operations with State gasoline taxes that had been restricted to highway construction. California approved a 5-percent sales tax on gasoline, which was previously exempt from the tax, to go into effect on July 1, 1972, to pay for transit construction and operation. A new Missouri law permitted Kansas City to levy a half-cent sales tax for mass transit. In Atlanta, voters had approved a 1-cent increase in the sales tax (from 3 cents to 4 cents) in two counties to pay for transit, while in Dayton, Ohio, voters approved a 1-mill property tax increase to pay for acquisition of a private bus company and subsidize its operation as a public system.

(The 1971 vote to increase the Atlanta sales tax would be cited many times in coming years. Voters in DeKalb and Fulton Counties approved the increase by a margin of 400 votes, with around 700,000 voters--only about 50 percent of those eligible—casting votes. Voters had turned down the increase in 1968.)

As the *Times* survey found, some efforts had failed. Michigan had shelved a proposed gasoline tax to subsidize transit. In Massachusetts, Boston Mayor White was working with other communities to divert State gasoline tax revenue to meet transit deficits, but highway interests were blocking the effort.

Part of the problem was that it was such a new issue that had grown before officials realized the scope of the deficits:

> Cities and states have subsidized transit for a decade or more, but in that period the number of cities doing so and the amount of money they have been asked to furnish has soared. In 1961, transit systems in only 21 cities received direct public aid; currently, more than 80 do so.
>
> Until recently, subsidies were relatively modest. But within the last three years or so, the dual pressures of soaring labor costs and a falling number of passengers have vastly increased the demand for public aid . . . .
>
> There is some question as to whether massive doses of public assistance in most cities can make economically viable an industry that typically reduces service, raises fares and loses riders when costs go up, that each year loses more and more riders to the automobile, and that must operate increasingly in sprawling, horizontal cities with long, thinly populated routes.

The growing deficits were putting pressure on Congress to provide subsidies:

> However, this move has raised questions from its opponents as to why the Government should subsidize local transit deficits any more than it subsidizes other municipal services such as police, fire and sanitation. The Nixon Administration believes the Government should help cities buy buses, build subways and meet other capital costs, and it sponsored a $3.1 billion mass transit aid program that was enacted last year. But it opposes Federal subsidies for operating losses other than as part of its proposed omnibus revenue sharing program. [Lindsey, Robert, "Cities Levy Extra Taxes For Subsidizing Transit," *The New York Times*, January 5, 1972]

While searching for funds, cities were expanding their transit networks. Atlanta was developing a subway and express busway system. In December 1971, the Southern California Rapid Transit District (RTD) unveiled plans for a 14-mile elevated subway line to connect downtown Los Angeles with the African-American "ghetto" of Watts, the first leg of a planned system. (It was hoping to use the revenue from the new sales tax for the line after voters had rejected a bond issue in 1968 that would have supported a $2.5-billion rapid transit system.) The Bay Area Rapid Transit would open its first leg on September 11, 1972, while Metrorail was under construction in Washington, D.C. (the first 4.6-mile segment of the Red Line would open on March 27, 1976). Transit systems were under development in Baltimore, Dallas, Denver, Detroit, Honolulu, St. Louis, and other cities.

Many of the urban areas developing rail rapid transit lines were counting on UMTA to pay two-thirds of construction costs. However, as the *Times* found, the Urban Mass Transportation Act of

1970, with its $3.1 billion in Federal matching funds, could not keep up with the explosion of transit expansion:

> In some cases, Administration officials have suggested the use of buses on reserved express lanes on highways instead, because they would cost less. This is an argument that rail transit interests say has been fostered by highway lobbyists.
> The Administration had drafted and circulated a proposed list of criteria—including certain minimum passenger volumes that would have to be served by a proposed system—that it said it planned to use in deciding whether a city qualified for grants for building subways or above-ground rail lines. The proposal has drawn blistering protests from the transit industry and big-city lobbyists. As a result, the draft was withdrawn and is now being revised. It has not yet been published in its final form.
>
> "We are against attempts to impose any criteria," said Dr. William J. Ronan, chairman of New York's Metropolitan Transportation Authority, who is president of the Institute for Rapid Transit, the principal lobbying group for pro-rail transit interests. "Why should there be criteria for rapid transit systems where that are none for [Federal funding of] highways, none for airways or waterways?" Dr. Ronan asked. He asserted that rail transit systems were by far the most efficient way to move large numbers of people.

Under Secretary Beggs argued that, "There has to be an analysis of the economics of what has been proposed, some indication of what percentage of the public will ride a system." An unnamed Transportation Department official put the dispute this way:

> The problem is that rapid transit has become too much like motherhood. You can't discuss it rationally, at least in public. If you say, "Well, maybe some cities don't need rapid transit and are better off simply to rely on the automobile," you're called a tool of the highway lobby.

One critic of rail expansion was Economics Professor George W. Hilton, a transportation specialist at the University of California at Los Angeles who had been a chairman of President Johnson's Task Force on Transportation Policy, a consultant to the World Bank on Transportation, and Acting Curator of Rail Transportation for the Smithsonian Institution. He called plans for a rail system in the low density Los Angeles area "a fiasco." He said, "There is just no market for it. It's just wishful thinking that you can go back into the past when the central business district served the whole area and people didn't have cars. All the forces in cities today are for diffusion."

He also was critical of plans in other areas, such as Atlanta and Baltimore, that were planning rail systems:

> What they're doing is making a huge investment in a declining market. Every place you look, the number of trips into the central business district is the most rapidly declining segment of urban transportation. [Lindsey, Robert, "Dozen Cities Planning or Building Transit Lines," *The New York Times*, January 30, 1972]

One option that was at least discussed was providing free mass transit, an option that advocates justified by transit's many benefits. Urban consultant Robert A. Aleshire made the case for free service in *Nation's Cities*, the magazine of the League of Cities:

> The automobile is choking the city and destroying its air. Cars cannot be stored, disposed of, parked, or given a place to drive. There must be a radical conversion in transportation modes from cars to mass transit. Sanctions such as barring cars from downtown areas are incomplete solutions and somewhat politically infeasible. An incentive approach which recognizes the true social costs of the car by making mass transit free is the most direct way to encourage rapid conversion.

Displacement of cars by buses would double highway capacity. Other benefits of a major modal conversion included reduction of the amount of land and money, as well as facilities and businesses dislocated, needed to build roads; air pollution, traffic noise, and the waste of time in traffic congestion would decline; land would be freed for open space or housing; barriers to inner city poor workers seeking jobs in the suburbs should be lowered. In short:

> Free mass transit would provide unlimited access by all citizens, rich and poor, young and old, minority and majority, to the full range of public services, recreation, jobs, and housing.

Aleshire acknowledged that cost "would seem the main argument against free transit." That was a narrow way of looking at the idea:

> [All] the factors must be put in the public cost equation. The costs of air pollution; auto deaths; land and resources for highways; leisure and productive time; people's houses, lives, and communities; unemployment; and racial polarization must all be charged against the present system. When all the factors are in the equation, the benefits of free mass transit far exceed the cost. [Aleshire, Robert A., "Why Not Free Mass Transit?" Excerpted in *The Washington Post*, November 7, 1971]

A new book, James C. Nelson's *The Future of American Transportation* (Prentice-Hall), took up the issue of social costs. Nelson, a Washington State University economist, found that present pricing policies were irrational and defeated competition among the modes. Like Aleshire, Nelson thought that highway user fees should cover the true cost of highway use, including air and noise pollution, displacement of homes and businesses, and disruption of other modes of travel without adequate subsidies. If transportation were priced honestly, he said, "the shippers and travelers could rationally choose between or among the modes, with the result that socially efficient divisions of traffic would result, more efficient investments among the modes would come about, and transport costs and rates could be lowered for the shippers and the general public." ["Pricing Transportation," *The Wall Street Journal*, November 8, 1971]

Bicycle Revival

The automobile had become the enemy, with transit and bicycles the favored alternative. U.*S. News & World Report* confirmed the trend in December 1971 when it reported that bicycle sales were "skyrocketing" with "no signs of slacking off" despite "a host of problems." Americans bought about 8.5 million bicycles in 1971 compared with 3.7 million in 1960, with nearly 80 million bicycle riders, twice as many as a decade earlier. Months-long delays in delivering bicycles after purchase were common. This growing phenomenon left the manufacturers, bicyclists, and government officials "in the same boat." They aren't quite sure how to cope with the nation's 'pedal power' craze." Planning of facilities to accommodate the surge was being combined with the search for ways to increase bicycling safety. Many cities—Boston, Chicago, Miami, New York, Omaha, and San Francisco among them—were designating bike routes. ["Bike Boom: A Way Out for Commuters?" *U.S. News & World Report*, December 6, 1971]

The boom would continue in 1972 and 1973. The downside of the boom was a boom in deaths and injuries, as *The Wall Street Journal* reported in August 1972:

> According to the National Safety Council, about 880 bicycle riders are likely to be killed this year in bike-auto accidents. Such fatalities have risen steadily in recent years, from 490 in 1961 to 850 last year. The National Transportation Safety Board estimates that about 130 additional bike-related deaths will occur.
>
> Nonfatal injuries also are soaring. Local police departments and hospitals say the problem has become acute.

The article mentioned introduction of the Bicycle Transportation Act of 1971 in both Houses of Congress that "would permit states and communities to use federal highway funds to develop bicycle commuter systems." [Brecher, John S., "The Boom in Bicycling Brings With It a Surge In Accidents and Deaths," *The Wall Street Journal*, August 15, 1972]

Covering the boom, *The Washington Post* recalled the original bicycle boom from about 1880 to 1910:

> Huge cyclist clubs were the first to lobby successfully for decent roads. Soaring bicycle sales brought mechanical improvements which helped spark new tools and machines for the development of the newborn auto. And when Henry Ford began mass producing his little Model-T, the bicycle went into a 60-year decline. Now it has come back and cyclists again want their share of the road . . . .
>
> Much of the back-to-the-bicycle movement is generated by environmentalists who claim those gas-eating monsters jamming the highways are doing everything from poisoning the atmosphere to rapidly diminishing the earth's natural resources.

In addition to reporting on safety concerns, the article discussed an increase in bicycle thefts:

> The bike boom also has generated a rise in thiefs. Although there are no national figures available, bicycle thievery amounts to millions of dollars. In California alone, police estimate the 1971 value of bikes stolen at $22.3 million.

> With the resale value of a good multispeed bicycle figured at $70 and up, theft rings are growing, police say . . . . Bicycle thefts are so prevalent in New York City that some youths have resorted to assembling "trash bikes"—old, beat up machines with water pipe handlebars and rusty frames. "Who'd want to steal one of these?" said the owner of one. [Mullen, Donald E., "The Bicycle Boom: From Executives to Junior Hell's Angels," *The Washington Post*, September 3, 1972]

A Statement on National Transportation Policy

Section 3(a) of the Airport and Airway Development Act of 1970, signed by President Nixon on May 21, 1970, called for formulation of policy:

> Within one year after the date of enactment of this title, the Secretary of Transportation shall formulate and recommend to the Congress for approval a national transportation policy. In the formulation of such policy, the Secretary shall take into consideration, among other things—
>
> (1) the coordinated development and improvement of all modes of transportation, together with the priority which shall be assigned to the development and improvement of each mode of transportation; and
> (2) the coordination of recommendations made under this title relating to airport and airway development with all other recommendations to the Congress for the development and improvement of our national transportation system.

Section 3(b) called for an annual report to Congress on implementation of the national transportation policy called for in 3(a). The annual report was to include the Secretary's specific actions "with respect to (1) the coordination of the development and improvement of all modes of transportation, (2) the establishment of priorities with respect to the development and improvement of each mode of transportation, and (3) the coordination of recommendations under this title relating to airport and airway development with all other recommendations to the Congress for the development and improvement of our transportation system."

On September 8, 1971, Secretary Volpe submitted *A Statement on National Transportation Policy* to Congress as required by Section 3(a). His transmittal letter stated that some elements of prevailing government policy "are not appropriate to transportation as it presently exists." He continued:

> On the whole, the transportation policy which has evolved, both consciously and unconsciously, represents an uneven fabric ill-suited to today's needs, and is, itself, a major contributor to the problems facing transportation today.

He saw three 1970 laws as each representing a "unique landmark in transportation policy": the Airport Act, the Urban Mass Transportation Act, and the Rail Passenger Service Act (creating Amtrak):

> For the future, the revenue sharing program for transportation will endow State and local governments with a great capability to cope directly with important transportation problems in ways most consistent with their own philosophies and requirements . . . .

The report identified the transportation system's symptomatic problems, which included "urban highway congestion, the severe deterioration of local public passenger services, airport and air traffic congestion, hazards to safety, environmental degradation, and the financial distress of important segments of the transportation industry." [p. 9] Underlying these symptoms were four fundamental systemic problems: the unevenness and inconsistency of transportation plans, programs and developments; the poor distribution of transportation services and facilities; the state of transportation labor relations; and the transportation regulatory structure. [p. 17]

Multi-modal transportation planning had been lacking. "Each mode's overriding preoccupation with the promotion of its own improvement and growth has dominated the growth of the transportation system." The result was maldistribution of services and facilities based on the funds each mode could command rather than planning of modal choices to serve needs. For highways, cost-benefit analysis revealed that rural areas received more in roads than rural residents paid for in user charges – a net loss to urban areas:

> [The] real question is not whether the apparent "overinvestment" in rural roads should be reallocated to roads in urban areas, but whether such overinvestment in fact exists and, if it does, whether it should be spent on urban transport facilities other than roads. Transportation revenue sharing is designed to let State and local governments come to grips with this fundamental issue.

For intercity freight, diversion of certain kinds of traffic from truck to rail could result in significant economic and social cost savings. The competition between truck and rail was distorted by Federal investment in roads:

> The overall policy and program implications of the poor distribution of transportation services and facilities are substantial for the economy and for society at large. Highway investment levels may well be too high, implying that some of that investment might better be used elsewhere in the transportation system . . . . Rationalization of the freight system would change the relationships of the rail, waterway and trucking modes, the chief question being how best to allocate, spread and finance the transitional costs equitably and in such a way as to minimize the dislocations to those involved. [p. 22]

The result of these and the other fundamental problems was that "the old ways of doing things are inadequate and unresponsive to society." The need to rethink the system was dictated by reality:

> This would not be so if there were fewer people, if they were less affluent, if they had not increasingly clustered in large urban complexes, and if they were willing to put up with the noise and smoke of an earlier era. [p. 27]

In this world that does not exist, the present system would be sufficient, but for the next three decades in the real world, "all indicators point to more people, more affluence, more urbanization and a rapidly escalating intolerance for poor system performance and for the generation of undesirable environmental side effects." Solutions of transportation's problems can be categorized as major capital investments in plant, equipment, or technology and noncapital-intensive policy changes. Technological advances offered solutions to many problems, but are often "prohibitively expensive, and have frequently generated problems more severe than those they were designed to solve."

Further, the price of transportation's unpleasant side effects, such as noise, air pollution, congestion, and crashes, is not included in its market price. The private sector had little or no incentive to invest in remedial technologies, leaving government to pick up the cost. "The failure of the market to recognize and reflect these costs is the major justification for government intervention and public investment in the development of new transportation technologies." Much of the increased funding for research and development (R&D) had gone to the air mode in recent years, but air transport and highways had traditionally "been accorded primacy." Transit R&D was 6.4 percent of Federal R&D outlays in 1970, up from virtually nothing in 1965, while rail R&D outlays totaled 3.5 percent. Policy changes were needed "to reorder the transportation system's performance by changing or rearranging the rules under which it operates, including those governing investment." [p. 27-29, emphasis in original]

To address these problems, the Federal Government must embrace two major themes: governmental reform and balanced, equitable economic growth. In the State of the Union Address on January 22, 1971, President Nixon had proposed reorganizing the Executive Branch. Four Departments would remain as is: State, Defense, Justice, and the Treasury. The other Departments would be merged into four "Super-Cabinet" positions: Economic Affairs, Human Resources, Natural Resources, and Community Development. The Department of Community Development would absorb FHWA and UMTA programs. Department Secretaries would be Counselors to the President working out of the White House, thus giving the President greater control of the Executive power structure:

> By organizing departments along mission-oriented lines, such as national economic development or local community development, their previous narrow preoccupation with function or constituency can be broadened to deal with the increasingly complex and interrelated issues confronting modern society. The close interrelationship between urban transportation and urban development is obvious, but today the responsibility is lodged in separate departments.

The transportation revenue sharing proposal, the report said, was "a long overdue admission that the Federal government is not able to provide answers to all the problems and that much decision making should be shifted to governmental levels closer to the people and the problems." The plan would result in transportation policy shifts as local governments determine policy, such as whether to use Federal funds for transit operating subsidies, formerly set at the Federal level. Together, government reorganization and transportation revenue sharing would stimulate greater productivity, formulation of national growth policy, major health and welfare reforms, consumer protection, coherent land use, environmental protection, integration of technology, and reclamation of cities. [p. 33-34]

Despite the emphasis on local determination, national objectives remained. In the past, they had been defined as: economic efficiency, environmental quality, safety, and support of other national interests, including national defense, economic growth, social development, and scientific research Now, a fifth objective must be added: facilitating local determination by decentralizing decisionmaking and fostering citizen participation. [p. 35-36]

To address present problems, "the need for a major policy reformation is readily apparent." [p. 37] The executive reorganization proposal and transportation revenue sharing were among the initiatives leading to "more effective approaches to the problems confronting us as a Nation . . . ." Restructuring or economic regulation of the transportation industry was another initiative that would bring "market forces to bear on competitive transportation industries . . . ." [p. 39-40]

The historic function of transportation, the report concluded, had been "to tie this vast country together." That function was essentially complete. "Society's new task, as a mature industrial economy, is of a somewhat different nature—providing service to the millions who want to use the transportation system."

The traditional "infrastructure-oriented approach of government" was not to be forgotten, but "the era of indiscriminate, massive, open-ended construction programs is largely coming to a close as the realization grows that there are wide variations in local, state and regional needs." Today's approach would have to be "redirected to accord with the times" as explained in the statement's final words:

> The Administration's approach to these challenges is rooted firmly in a deep awareness that the needs of our people in the final third of this century will require vastly different solutions than those appropriate in past decades, and its proposals are designed to guide and nurture a fruitful and productive Federal transportation policy in the future. [p. 40-41, emphasis in original]

The plan was not well received. It was, as *The New York Times* put it, "long delayed" because of differences within the Nixon Administration and "the opposition of the trucking industry." (Under the Airport Act, the report had been due in May 1971.) *Business Week* agreed about the delay:

> On taking office, the Nixon Administration had put such a policy statement at the top of its priority list. Yet Volpe's department missed one deadline after another, apparently because of the difficulty of getting diverse transportation interests to agree to policy proposals.
>
> Transportation watchers, whether or not they were sympathetic to the Administration, had been anticipating a bold and sweeping approach to transportation philosophy. What they finally got was a major disappointment—an overly generalized and relatively vapid "nonstatement," as one industry lobbyist characterized it.

Policy planners had found that "industry lobbyists who wanted to preserve the status quo carried more weight at the White House, as well as on Capitol Hill." The result was that the policy was released with little fanfare. Secretary Volpe was in Pittsburgh for the 5th International Conference on Urban Transportation. He was announcing the $60 million grant to the Allegheny County Port Authority for a controversial transit system while Assistant Secretary Charles D. Baker conducted a hastily convened press conference about the new statement of transportation policy.

Chairman Hartke of the Senate Commerce Committee's Surface Transportation Subcommittee, was among those underwhelmed by the report:

> Ever since this administration took office, it has held out an illusion that soon it would present the Congress and the nation with a transportation policy . . . . I hope this does not represent the final effort of this Administration because, if it does, we are in worse shape than I had thought.

He added that transportation revenue sharing was a "joke" while the reorganization plan was viewed on Capitol Hill as an "illusion" designed to make the Administration "look like it is doing something when it is not." [Lydon, Christopher, "Transportation Agency Backs Easing of Regulation," *The New York Times*, September 9, 1971; "A Weak National Plan Chugs in Behind Schedule," *Business Week*, September 18, 1971]

Engineering News-Record described the statement as, "Long on generalizations and short on specifics." The article added:

> As revealed in the statement, the Administration is chiefly concerned with regulatory reform that would restore greater market competition, and efficiency, among different modes. It is also concerned with creating or reestablishing balance between different types of transportation and the role the federal government can play.

It quoted Baker as saying that, "the considerable absence of cost-based pricing makes it impossible for the various modes of transportation to operate at their most efficient levels."

The magazine reported finding little support within the transportation community. An ARBA spokesman said the statement had not "adequately responded to the mandate of Congress for some direction on policy as spelled out in the airport act requirement." AASHO Executive Director Alfred Johnson challenged the contention that the highway system is overbuilt. The one sympathetic comment was anonymous, noting that the Administration's policies had preempted Secretary Volpe's goal of a general transportation trust fund. ["Transportation Policy Makes a Sketchy Debut," *Engineering News-Record*, September 16, 1971, p. 71]

(As noted earlier, the transportation revenue sharing plan would be cast aside by Congress. Reorganization of the Executive Branch received some consideration, but also would fail to secure enough votes in Congress. Neither plan had a constituency willing to fight for it; the interests preferred the status quo. That was also true initially for deregulation, but Presidents Nixon, Gerald R. Ford, and Jimmy Carter would make considerable progress in deregulating the rail, airline, and trucking industries. Mark Rose, Bruce Seely, and Paul Barrett tell this story in *The Best Transportation System in the World* (Ohio State University Press, 2006). The title of their book comes from the constant refrain through the 20th century of those with a vested interest who opposed deregulation. With the current regulatory structure, they pointed out, the country had the best transportation system in the world—why risk deregulation?)

A Question of Proper Mix

Throughout 1971, the mighty roadbuilders, the feared "road lobby," was running scared. Their public relations outreach was being overwhelmed by the forces arrayed against them. Opponents blocked much-needed Interstate highways. Organizations such as the Sierra Club were joining the battle. The courts were proving receptive to the anti-highway forces. Local officials were bending to citizen complaints about highways. Governors and Mayors were desperate for Federal money to pay for transit. Academics were siding with transit advocates. Newspaper reports seemed to favor the opponents. The forces chipping away at the Highway Trust Fund in support of transit, especially rail transit, were getting the upper hand.

Through the 1960s, highway officials had been convinced that all their problems could be solved if only they could find the right combination of PR moves that would get the public to understand how beneficial the highways network, when completed in its entirety, would be.

AASHO's Johnson never abandoned that idea. He was a career highway man who had been Chief Engineer of the Arkansas State Highway Department where he became friends with Frank Turner. He had been president of AASHO before becoming its executive director and had worked in the mid-1950s with the Governors' Conference to gain support for President Eisenhower's highway program. He had represented AASHO before countless Capitol Hill hearings and in meetings with Members of Congress. Now, in 1971, he saw peril for his beloved program from forces that were weakening it, blocking the projects that would prove its worth, and undermining public support for highways. He tried to put the situation in context during a speech to AASHO's regional Mississippi Valley Association on March 12, 1971:

> In order for the [highway] administrator to properly carry out his official responsibility as a public servant, he must keep the public completely informed as to highway needs, the condition of the system, financial requirements, etc., so that the public can make the necessary decisions regarding the program. Therein lies a void at this time!

He urged his colleagues to put their present problems in historical context:

> It is the history of all public works programs, that when a basic need is so overwhelmingly evident in the beginning, you have strong public support and activity. However, long before the program completely satisfied its primary and basic function, a number of years pass and during that time a level of tolerable service is usually achieved and another generation or two have come upon the scene, and they begin to take the great accomplishments of the program as a matter of fact and the public support lags and becomes apathetic.

> In addition . . . others want to get into the act, sophistication and appendages are added to the program ostensibly to improve it or better it for various reasons most of which are rather expensive and time-consuming, but sometimes of questionable value.
>
> After the public becomes apathetic and turns into a tacit force, the critics, motivated by various reasons, then are able to establish their identity because they are articulate, aggressive forces and, in time, they gather supporters and it can become a fad to oppose the program and disenchant the public with it.
> This is the spot we are in right at this moment.
>
> Usually, the cycle is completed by the level of service of the program becoming so inadequate that public interest is rejuvenated, and the pendulum swings again. This could take a long time with effort on your part.
>
> Much of the situation that we face today is a direct product of highway officials not adequately educating and informing the public that they serve.

He dismissed the criticism of city officials, saying "it is because the highway program has been so successful and cities underfinanced." He was "shocked at the headway that the anti-highway movement is making." The new environmental requirements could "well be the straw that breaks the camel's back in stalling the highway program." He continued:

> We have college professors all over the country analyzing the itemized checklist in the environmental requirements of the highway program and developing instructions for bringing litigation and stalling highway projects with injunctions.

From April to June 1971, *Better Roads* ran a reader forum on "How Do the States Fight Anti-Highway Propaganda." Highway officials from around the country responded to the following situation:

> Recent anti-highway comments by groups and individuals have been leading the public to believe that all highway funds come from general tax revenues.
>
> The Questions:
>
>> As a highway official and engineer, have you found it necessary to rebut this misinformation?
>> What means have been available to you for presenting the real facts concerning the highway financing?
>> Which method have you found to be the most effective?

Each issue featured responses. In the April 1971 issue, for example, New Hampshire's Reuel W. Webb said he used "real facts" in appearances before the State legislature and during speaking engagements to argue against a constitutional amendment that would allow the State to use some of its highway user tax revenue "for purposes other than highway reconstruction, construction and maintenance," as had been the case since the State adopted a 1938 constitutional Good Roads Amendment.

D. M. Faircloth of the North Carolina State Highway Commission had spent more time justifying the 2-cent State gas tax increase in 1969 than the Federal Highway Trust Fund, but had spent considerable time defending non-diversion at the Federal level. The State had a speaker's pool to refute false claims. "The most effective method so far defending our true position regarding funding, both federal and state, has been a combination of facts taken from the fact sheet by the media and used in feature form, and our speaker's pool.

George H. Andrews, Washington State's director of highways, said anti-highway forces in his State were well aware of the sources of highway funding, and were not spreading misinformation but arguing that highways should be funded out of general tax revenue so they were subject to continuing legislative priority decisions. Most people "have no idea at all how the funds are raised" for highways or anything else. Editorially, most of the State's newspapers favored diversion. As for countering negative press, Andrews said:

> We have found no method really effective in getting information to the public. The minute you start dealing in figures, the public mind turns off and switches to the sports pages.

Other respondents discussed public hearings and publications containing "true facts," employee speeches, tours of legislative districts, effective use of publicity units, reports to legislators, meeting people, pro-highway film production, cultivating cooperative press, and outreach to good roads organizations.

In Frank Turner, the highway community had a leader who understood the need to reach out to the public. In June 1970, he released a report on *Benefits of Interstate Highways*, which he converted into numerous press releases. "Interstate and other highways influence the growth of the economy by improving mobility for economic and social activities." User benefits from the Interstate System, estimated to be $107 billion, would more than pay for its estimated cost of $70 billion. These benefits included reductions in travel time, operating costs, and accidents. General economic and community benefits included enhanced land use and increased land value; industrial and commercial advances; opportunities for community change ("displacement for highway right of way is being used as an opportunity to upgrade housing and community services"); diversion of traffic from residential areas; reduction of air and noise pollution, and encouragement of growth centers and new towns.

Turner also released a series of news releases about the environmental measures incorporated into Interstate and other highways. For example, work on a four-lane I-65 bridge across the Tennessee River near Decatur, Alabama, had been halted for several months because 65,000 ducks and geese from the northland had settled at Wheeler National Wildlife Refuge (press release, December 16, 1969). Another press release reported that Beverley's Mill in Thoroughfare Gap, Virginia, dating to George Washington's time, had been in the path of I-66 until the right-of-way was shifted to preserve the historic building (May 24, 1970).

Turner compiled all the information into an internal 500-page looseleaf *Resource Book on the Federal-Aid Highway Program* (September 1971) that FHWA officials could adapt for speeches, letters, interviews, and other occasions to rebut criticism.

He also addressed highway groups throughout his tenure, often in "preaching to the choir" vein. On September 23, 1971, for example, he was in Arlington, Virginia, to address the northern Virginia Chapter of the Virginia Motor Vehicle Conference. He shared the stage with Senator Harry F. Byrd, Jr., who had been appointed to take his influential father's seat in November 1965 and won reelection to serve through January 3, 1983. Byrd told the group that "public transportation has an important role to play," but "despite the need for better mass transit, improved highways are still essential." He said that "we cannot afford to ignore highway construction requirements," and if we did so, the "only results of that kind of policy would be bigger traffic jams . . . and bigger potholes."

Turner's speech, called "The Road Ahead," began with the observation that 1956 "would have to be regarded as 'a very good year'" because it was when "the most gigantic public works program the world has ever known" was launched. Although only 75 percent of the network was open, it was already "paying untold benefits to this Nation . . . ." Improvement of other roads had received less attention but he explained, "No apology is needed for this past emphasis on Interstate System construction, for I am convinced that it was a wise and correct decision."

Even as the final mileage was completed in the next few years, "we must be readying ourselves to move into two known areas of great need – the cities and the primary routes between them . . . . There must be no lag, no delay, no indecision, for the time to move is now." To address these needs, "there must be no appreciable drop in the overall level of highway funding . . . ." The funding being spent on the Interstates—about $4 billion a year—will be needed for road improvements to address these two great needs. "The record is clear" that the Federal-aid primary highways had to be brought up to "acceptable standards of safety and efficiency." In cities, "highways and streets are their very lifelines." This was "obvious to anyone whose eyes and mind are open to the facts."

For cities, highway upgrades and better use of existing facilities were essential as were adapting the network for buses, including busways such as the restricted lanes on the Henry G. Shirley Memorial Highway near the Marriott Twin Bridges Motel where the conference was being held (the Shirley Highway was designated I-95 at the time, but the portion inside the Capital Beltway is now part of I-395). FHWA, Turner said, had been working with the States and UMTA on several bus transit programs around the country. "More are on the way."

For the primary highways, he thought a "Junior Interstates" program was needed to "upgrade or replace them with something more than a two lane road." Although they would not meet Interstate control-of-access standards, the Junior Interstates "<u>will be</u> divided highways, and as such they will be immensely safer than the existing two-lane roads they will replace." (Emphasis in original.) [Curry, William Nye, "Rapid Transit Use of U.S. Funds Scored," *The Washington Post*, September 24, 1971]

Highway groups provided information to their advocates to rebut what the November 1971 issue of HUFSAM's *Highway Users* magazine called a "Web of Myths." The article rebutted the following myths with "a Dash of Truth Serum," in summary:

- Highways are Paving Over the Country—Streets and roads in the U.S. occupy less than 1 percent of the land area. In urban areas the average is 25 to 30 percent, about the same as before the automobile.
- Highways are Ruining the Cities—Urban freeways presently planned will require less than 3 percent of land in the cities.
- Highways are Destroying the Environment—In 1969, over a half-billion dollars was spent on Federal-aid highway projects for elements of direct benefit to the environment.
- Highways Erode the Tax Rolls—Highways such as I-80 in Pennsylvania, Route 128 circling Boston, and U.S. 81 in Yankton, South Dakota, were economic boons.
- Highways are Unsafe—FHWA estimates that the original 41,000 miles of Interstate highways would save 7,500 lives, and prevent 347,000 injuries, 823,000 accidents, and $250 million in property damage.
- Highway Interests are Against Mass Transit—Highway engineers recognize the value of buses and encourage their use; FHWA urged its engineers in the 50 States to "encourage the greatest use of buses in preference to individual automobiles."
- Americans are Being Taxed Unfairly for Highways—Highways are paid for by the people who use them in proportion to the miles they travel over them.
- Highways Destroy Houses and Businesses—Changes in Federal law had expanded relocation assistance benefits.

The industry had been rebutting these myths for years, but now had a "script" based to a large extent on information compiled by FHWA.

When officials saw an article or editorial they did not like, they responded. For example, an editorial in the November 13, 1971, issue of *The New York Times* ("One for the Road") objected to the Senate Finance Committee's decision, without public hearing or discussion, to amend the Administration's tax bill by diverting the 7 percent of the Federal excise tax on whiskey to the "already swollen" Highway Trust Fund. The shift was compensation for the bill's repeal of the 10-percent excise tax on light trucks:

> This transfer makes no budgetary or transportation or legislative sense. It is yet another greedy power play by the voracious highway lobby, engineered by Senator Randolph of West Virginia and Long of Louisiana.

The Highway Trust Fund had "an accumulated surplus of $3.6 billion" and would add $786 million in 1971:

> With the Conference of Mayors clamoring for $350 million in emergency funds for mass transit, does it make any transportation sense to transfer exactly that amount to the already swollen highway fund?

> The pending tax bill is a revenue measure, not a transportation bill. Does it make any legislative sense to make what is in effect a critical transportation policy decision in this covert and circuitous fashion?

Members of both parties, including Republican Senator Percy, planned to oppose the amendment on the Senate floor, but if it survived, the House members of the conference committee might not object to it:

> Are these shenanigans democratic?
>
> The highway lobby and their political allies have become drunk with power. Only they could have dreamed of characterizing a tax on alcohol as a "highway-user tax." It is time for the Senate to sober them up.

In a letter printed on December 8 with the heading "Transportation: A Question of Proper Mix," Senator Randolph said the editorial "reveals the same kind of shortsighted refusal to face facts that you attribute to me as a so-called political ally of the 'voracious highway lobby.'" The alleged surplus was "artificial," the result of "administrative withholding of funds obligated to the states" the past 4 years. Their release was essential "to redeem the pledge made by Congress in 1956 to build a modern highway system." The diversion of whiskey tax revenue was simply "compensatory revenue" needed because the House of Representatives had proposed to repeal of the excise tax on light trucks. In fact, he said, the Highway Trust Fund "could easily be faced with a deficit in the very near future" without compensation for lost revenue.

As for the proper mix, he wrote:

> In many minds, the issue became one of highways versus mass transit, as if taking money from the Highway Trust Fund would make it available to help meet the many critical mass-transit needs of the cities. Resolving all of our country's transportation problems is not a matter of choosing between highways, subways, buses, trains or airplanes. It is instead a matter of determining and providing the proper mix of all these through what is called a balanced transportation program. I am an ardent supporter of such an approach and continue to work for elimination of the financial inequities that exist among the various transportation programs . . . .
>
> Dissipating the Highway Trust Fund does not solve the problems of mass transit, and in fact impairs effective mass-transit operations in the many cities where they are carried out by buses . . . . America depends heavily on motor vehicles. There continue to be widespread demands for better roads over which to move the people and products of this nation. It is unfortunate that The Times cannot see the country for the skyscrapers.

Even as highway officials searched for hopeful signs amid the gloom, transit interests were finding their expectations unrealized. The funds authorized by the Urban Mass Transportation Assistance Act of 1970, subject to appropriation, were not flowing according to authorization levels. Secretary Volpe and UMTA Administrator Villareal were supportive but the White House and OMB were seeking only partial appropriations for FYs 1971 and 1972. The Administration claimed that transit systems were not ready for the money, in part because they did not have the matching funds. An unnamed Administration policy official described the transit proposals coming in for funding as lacking "any merit at all" in terms of planning. The few plans ready for big sums, such as those for New York City, would take so much funding that nothing would be left for other cities and towns.

To these rationales, one transit authority official griped, "If you don't want to spend the kind of money Congress has approved you can come up with all kinds of reasons why nobody's ready for it."

Most funding, thus far, had gone to saving or improving bus systems, many in smaller towns. When a big city transit system requested funding for rail improvements, UMTA suggested that the system request bus money instead. It wanted to fund activities that would become a reality quickly, not long-term rail improvements that wouldn't be completed for years.

Then there was the political calculation as summarized by *The Wall Street Journal*:

> Some key administration officials have been saying in their own councils and in talks with transit leaders that they see little political value for Republicans in pouring money into transit systems of traditionally Democratic big cities. "The cities aren't going to vote for Richard Nixon in 1972 no matter what we do," says one transportation official. [Karr, Albert R., "Transit Boosters Complain That Administration is Holding Back Funds Already Okayed by Congress," *The Wall Street Journal*, December 27, 1971]

Although funding for capital improvements was important, local officials were just as concerned about the growing burden of operation costs. As the House Committee on Banking and Currency put it in its report on the Urban Mass Transportation Assistance Act of 1970:

> The committee received a great deal of testimony concerning the need for a new program of Federal grants to assist States and local public bodies to defray operating deficits incurred by public or private mass transportation companies in providing commuter service . . . . Many communities . . . are faced with the need to provide public subsidies to cover operating deficits in order to preserve adequate transit service at reasonable fares.

The report discussed the "considerable" dangers of Federal subsidies:

> First, there is a danger that such subsidies would reduce the incentive of cities to make capital improvements in their systems, and, second, there is little doubt that such subsidies would require close Federal scrutiny of operating details and practices of transportation companies. [*Urban Mass Transportation Assistance Act of 1970*, House of Representatives 91st Congress, 2d Session, Report No. 91-1264, p. 9]

To address the issue, Section 9 of the 1970 transit legislation called on the Secretary of Transportation to study the feasibility of Federal assistance to help defray the operating costs of mass transportation companies in urban areas. The study also was to cover any changes in the

Urban Mass Transportation Assistance Act of 1964, as amended, that would be necessary to provide such assistance.

Secretary Volpe submitted *Feasibility of Federal Assistance for Urban Mass Transportation Operating Costs* to Congress on November 22, 1971. "No one can dispute," the report stated, "that there has been a serious decline in urban mass transit over the past decade or that the industry is currently in a critical financial state, a state approaching crisis in many localities." The decline was reflected in ridership, which had dropped from 23 billion revenue passengers in 1945 (the last year of World War II rationing that reduced automobile usage) to 11 billion riders in 1955 and 7.3 billion in 1970. Other problems included curtailment of services, increased costs, growing deficits, and the failure of transit companies. Public acquisition to prevent the abandonment of transit service shifted the burden from private owners who had been unable to turn a profit to public agencies. [*Feasibility*, p. 10]

More broadly, the report found that "the present condition of transit has also been significantly affected over the longer run by trends in urban development and related public policies." The post-war boom spurred the acquisition of increasing numbers of automobiles and a shift to suburban living:

> The explosion of American population into suburbia was accelerated and reinforced by Federal housing policies that made mortgage money relatively more available, by Federal income tax deductability of mortgage interest, by increasing auto ownership, and by the development of extensive systems of express highways. This system of highways accelerated the dispersal of residences, business and industry. [*Feasibility*, p. 26]

The decline in public transportation mirrored the rise of the automobile:

> The increased ownership and utilization of the automobile have reshaped communities so as to greatly reduce the usefulness of <u>conventional</u> mass transit (fixed routes on fixed schedules, typically oriented to the CBD). While public transit once had a major influence on the distribution of population, jobs, and commercial activity, this is no longer so. Cities and their suburbs have sprawled in such a way as to preclude the relatively high densities required for the economic operation of <u>conventional</u> transit, and new forms of public transit compatible with these changed circumstances have not yet emerged.

The "under-pricing of the auto mode relative to transit" was another factor in the decline of transit. Counting direct and indirect costs of urban expressway construction, economists agree that "user charges (primarily gas taxes) incurred by peak period users of such facilities do not, in fact, cover the increase in costs associated with providing the extra lanes needed for peak loads. Land acquisition and construction costs may be covered, but "the intangible costs of disrupting established communities and living patterns can be enormous, not to mention the impact of noise on residents and activities that are not relocated." The cost of air pollution ("largely from automobiles") is another incalculable cost generated by the automobile. [*Feasibility*, p. 27, emphasis in original]

The report discussed the shift from private to public ownership:

> Generally, the motive for public acquisition has been the same as the motive for local subsidization – i.e., transit is a needed public service and should be maintained and publicly supported . . . . But public ownership does not in itself change the basic economics of rising costs and declining ridership; it may provide some financial relief due to reduced tax liabilities, but these reliefs could also be offered to private carriers.

The report acknowledged that the privately owned transit companies often were perceived as seeking profits over service:

> Public transportation in urban areas was caught up in the reform movement that brought public service and public utility industries under direct governmental regulation. These industries were considered to be natural monopolies from which the public needed protection against watered securities and the extraction of monopoly profits.

The regulatory mindset was "basically passive," dealing "only with market entry, routes, fares and service levels," rather than the adequacy of services for all users or the possibility of differential pricing techniques.

Now, as transit shifted to public ownership, traditional regulation had been "overshadowed by other governmental entities whose policies have substantially affected transit." Government intervention in the form of such activities as safety and pollution standards, insurance requirements, labor practices and wages had affected operating costs, often as a result of agencies and authorities without responsibility for mass transportation. These agencies and authorities included parking authorities, traffic engineers, zoning appeals boards, and of course highway planners. [*Feasibility*, p. 30-31]

Only 17 States had programs to subsidize transit operating costs. Most had been enacted as emergency measures after private transit systems went out of business. Only New Jersey and Pennsylvania had significant subsidy programs. [*Feasibility*, p. 36] From 1961 to 1971, "the number of municipalities that provide operating assistance to transit systems has increased nearly 300 percent (from 21 to 81)." Like the State subsidy programs, the local programs "are relief measures designed to preserve existing transit service, with little or no attempt to achieve any additional substantive policy objectives through financial assistance." [*Feasibility*, p. 44]

Whether the Federal Government should help with operating subsidies depended on the answer to several major issues as well as a choice among mechanisms for aid. First, what are the objectives? How do they correlate "with the primary goals of the community and . . . the process of comprehensive development planning directed toward implementation of those goals"? Beyond this, was a long list of possible objectives, such as mobility for urban populations, including non-drivers, the poor, the old, and the disabled; stabilization or reduction of fares; stimulation of ridership; reduction of the deficit; offsetting subsidies for the automobile; and relieving the financial burden on cities and States.

Government intervention carried risks. The private operator provides only the service that users are willing to pay for. Public owners discard the market mechanism in determining service and fare, leaving government to decide what is needed and what is reasonable. Following government acquisition, a major issue is "preserving or creating incentives for management and labor to provide efficient and responsive service." With government paying the bills, "it may be difficult to ensure that transit managers would operate henceforth in a prudent and reasonable manner." At the same time, the subsidizer must decide the extent of control to be exercised to comply with existing or new standards. In short, if Federal subsidies are to be provided, what requirements should be applied in return for the funds? [*Feasibility*, p. 52-55]

Further, if Federal operating subsidies were to be approved, officials would have to decide on the appropriate mechanism for doing so. Based on field work by the National League of Cities/U.S. Conference of Mayors, the report identified several methods of subsidy:

- Deficit Subsidies – Addressing the gap between a system's total costs and total revenues leaves open questions about what costs and revenue are to be counted (for example, return on capital, depreciation, overhead, specific services?)
- Input Subsidies – Funds would cover an absolute amount or percentage of total costs or some particular element of cost. Explicit standards would be needed to ensure the additional funds result in improved service rather than "a mere windfall." The effect on service would be hard to predict and could distort service based on which elements of cost are subsidized.
- Output Subsidies – These payments would be based on system outputs such as ridership or transit service offered. Identifying the outputs to be rewarded would be difficult, and output subsidies "are not really an effective means of eliminating deficits." [*Feasibility*, p. 56-62]

Further decisions would have to be made about the recipient of the subsidy. Should it go to the transit operator and if so what factors could be considered in deciding the amount of the subsidy? Should it go to consumers in hopes of increasing ridership? As an alternative to either option, should the current capital assistance program for mass transportation be modified, for example by increasing the Federal share, to reduce financial burdens on operators. Shifting aid from existing categorical programs to the Administration's revenue sharing proposals also should be considered as an alternative to subsidies since State and local officials could then decide whether to use Federal revenue for subsidies or other purposes. [*Feasibility*, p. 62-66]

In a three-page section, the report considered service and policy innovations to improve mass transit and overcome the obstacles in its path. What was needed were "changes which may be so fundamental and so comprehensive as to involve the operations of an entire system rather than modifying service in only part of a system." Time would be needed to pull together resources from all levels of government to allow sufficient scope "to ensure inclusion of potential variables, to obtain reliable information, and to induce transit managers and local officials to experiment with innovative changes."

Tests were needed on the "regulatory, pricing, tax and other measures and incentives that would be employed" to identify the best ways to improve service and ridership. Innovations might include:

- Preferential treatment for buses, demand responsive services, improved off-peak use of labor and equipment, differential pricing by zone or time of day, provision of fringe parking;
- Increased parking rates for automobiles in the central business district (CBD), increasing or introducing tolls for autos entering the CBD, banning autos altogether in the CBD at all or selected times, metering autos onto freeways and streets, preferential treatment for carpools;
- Staggered work hours, special services for the "transportation disadvantaged," and greater integration of transportation and land use planning;
- Subsidies could be tested in different forms, such as a subsidy based on ridership or based on miles traveled and/or services provided, a stamp program so the "transportation disadvantaged" can travel at a discount, or a per capita grant.

The Department would continue evaluating such programs before deciding whether to make necessary recommendations to the Congress. [*Feasibility*, p. 67-69, innovations summarized]

The report concluded that, "Little has been done to determine whether transit can compete with the automobile under present conditions":

> Fundamentally, the revenue/expense squeeze in which transit is caught results from its lack of success in adapting to new patterns of urban development, responding to changes in public preference and expectations, and competing effectively with the private automobile. Faced with increasing dispersal of residential, employment and shopping centers in metropolitan areas and the personalized conveniences of the automobile, transit has held to its concept of fixed, line haul service into dense central core areas – even though the financial viability of that type of service seems to be rapidly diminishing. [*Feasibility*, p. 2]

State and local subsidies "have not reversed the decline in ridership or prevented increased operating deficits, although the decline in riders is substantially less than the national average." The subsidies kept some service from being eliminated, but " it is a debatable question" whether they improved service for those dependent on public transportation, prevented fare increases, stimulated innovation or experimentation, or increased awareness of commitment among those involved in solving transit's problems. [*Feasibility*, p. 2-3]

The Federal Government had taken steps to strengthen urban mass transportation, including "assistance for capital investment in right-of-way, structures and vehicles, provided through both the UMTA capital grant program and, with respect to rights-of-way, through the Federal-Aid Highway Program." Transit operators also had been exempted from certain fuel and vehicle excise taxes imposed on other highway users:

> Available experience and analysis suggests that further extension of Federal support in the form of operating subsidies in and of itself would not contribute to the significant alleviation of the underlying difficulties of which the transit deficit is symptomatic. [*Feasibility*, p. 3]

In the end, "there is not enough reliable or behaviorally validated information available at present for anyone to advocate with confidence a definitive solution to the problem of urban transit or to gauge accurately the long-range effect of a Federal subsidy program." Further exploration was needed to support urban transportation policy decisions.

Therefore, the report contained two recommendations. First, Congress should enact the President's Transportation Special Revenue Sharing proposal along with his General Revenue Sharing plan. The President's proposal to eliminate separate categorical aid programs would allow States and metropolitan areas to use Federal funds "in accordance with local concepts of need and priority." The funds could be used for transit operating subsidies if State and local officials concluded that doing so would address "a pressing need."

Second, the report indicated the Department of Transportation would "continue to evaluate the desirability and practicality of service and policy innovations . . . and to study the important questions relative to operating subsidies . . . ." The results of this continuing study would determine if the Department submits legislative recommendations to Congress. [*Feasibility*, p. 4-5]

The report did not address the source of revenue for operating subsidies. Under revenue sharing, it would come from existing programs. Beyond that, the report did not discuss the longstanding issues of funding from the general Treasury or diversion from the Highway Trust Fund. It also did not discuss creation of a Transportation Trust Fund or a separate Mass Transit Trust Fund.

AASHO's annual meeting in December 1971 in Miami Beach featured another congressional panel. Representative Harsha summarized what everyone on the panel and in the audience knew:

> I think that the year 1972 is going to be a very crucial year for the Federal-aid highway program. I say this not only because of [media attacks] but because of the various attacks on the highway program that are coming from other segments of our society; because members of congress who have not been aligned heretofore with the anti-highway coalition, now seem to be aligned with it for various and sundry reasons; and because of some of the recommendations of my own administration in Washington.
>
> This has led me to believe that the year 1972 is to be the year of reckoning insofar as a so-called "after" '75 highway program is concerned.

He was worried that the Department of Transportation, OMB, and the White House would ignore FHWA's recommendations. He did not see a need for the President's Executive Branch reorganization plan, under which FHWA would end up in a new Department of Community Development.

Highway critics, he said, "seem to be growing not only in intensity and volume and activity but they are also developing rather ingenious methods with which to invade the Highway Trust Fund. He mentioned the Bicycle Transportation Act of 1971 as an example of the ingenious plans. [*American Highways*, January 1972]

Secretary Volpe also addressed AASHO on December 6. He struck a warning tone in saying that the Interstate System must be completed as rapidly as possible "except in those instances where local or State officials decide they just do not want them." He added, "I do not think we are going to force it down their throats." He endorsed the President's special revenue sharing plan for transportation ("the greatest good for the greatest number") and the Executive Branch reorganization ("wholeheartedly").

Like highway officials the past few years, he had been thinking about how to counter the criticism they faced. If they wanted to improve their image and create a better transportation system, they must:

- Present facts to the public to disprove the stereotype that highways are built without regard for environment or displaced families.
- Develop an efficient mass transit system that people will want to use. This system would increase the use of existing facilities.
- Develop an integrated system of roads and interstate highways that will effectively link section of the country without hurting the environment.

Highway officials "must always stress that protection of the environment is a goal, not a constraint."

He summarized, "We must do a better job of proving that highway construction can be compatible with environmental values. The facts are our strongest defense." [Payton, Sheila, "Volpe: 3 Challenges Face Road Builders," *Miami Herald*, December 7, 1971]

Part 3
The Year of Reckoning

Planning for Reelection

From the start of the Nixon presidency, the economy had been deteriorating from the effects of Kennedy and Johnson Administration policies and congressional inaction or ineffective action. Professor James MacGregor Burns described the situation facing President Nixon as he began planning his reelection campaign for 1972:

> Inflation was running at about 5 percent a year when Nixon took office. In accord with sound Republican doctrine, the new Administration must throttle down the social spending and the budget deficits for which they had castigated Humphrey and his fellow Democrats in the 1968 election campaign. But Nixon was wary. He still felt the scars of his defeat by Kennedy in 1960, when he had been beaten in part by the Eisenhower recession, or so he believed . . . .
>
> For over two years Nixon teetered between his two fears, tried to fine-tune the economy with a mix of monetary and budgetary policies, along with exhortation from the White House. It was hard going every inch of the way. Fine-tuning would have been difficult even for a united government. The President had to share economic policy-making with the very independent Federal Reserve Board under its imperious chairman [William McChesney Martin, Jr., who had served as chairman since the Truman Administration, and would leave office on February 1, 1970, replaced by Arthur F. Burns] and with the Democratic-controlled Congress. By spring 1970 both prices and unemployment were rising sharply—a remarkable combination. The federal deficit was soaring, interest rates climbed, and then the stock market took its steepest plunge since depression days. In June 1970 came the collapse of the Penn Central Railroad, called by [business columnist and *Times* editorial writer] Leonard Silk the greatest business failure in history.

As the situation continued to decline on the international front as well, the President held a series of secret meetings at Camp David. He faced "a painful dilemma," especially since the best options went against the President's conservative views:

> He would have to move on both the domestic and the global front, in particular because the convertibility of paper into gold and allowing the dollar to depreciate would stimulate price rises at home as the dollar price of imports mounted. Hence it would be necessary to establish mandatory price and wage controls. But if there was any man who had, year in and year out, vociferously denounced controls, it was Richard Nixon. His aversion was based in part on conventional Republican doctrine but even more on his brief working experience with price controls in the Office of Price Administration during World War II.

On August 15, 1971, he emerged from Camp David to announce his New Economic Policy:

> [The] President bit both bullets—indeed, several bullets. He imposed a ninety-day freeze on prices, wages, and rents, suspended the convertibility of dollars into gold, and placed a 10-percent surcharge on imports. He asked Congress to repeal the 7 percent excise tax on cars, to speed up personal income-tax exemptions, to put off welfare reform for a year, to postpone revenue-sharing programs with the states for three months, to pass a 10 percent "job development credit"—a tax credit to business for investment in new plants and equipment—that would drop to 5 percent after one year. [Burns, James MacGregor, *The Crosswinds of Freedom*, Vintage Books, 1990, p. 555-556]

The President's speech on August 15, 1971, announcing his New Economic Policy was called "The Challenge of Peace." In view of the "progress" made toward ending the Vietnam War, he said, it was "an appropriate time for us to turn our attention to the challenges of peace." He explained:

> Prosperity without war requires action on three fronts: We must create more and better jobs; we must stop the rise in the cost of living; we must protect the dollar from attacks of international money speculators.

The 90-day freeze on all wages, rents, and prices was phase 1 of the plan. Phase 2, beginning in December, was a less stringent but mandatory system of price and wage controls, but with latitude for increases upon Administration approval.

President Nixon pointed out that Congress "has already delayed action on two of the great initiatives of this Administration." He now asked Congress to delay his proposals for 3 months in the case of General Revenue Sharing and 1 year for welfare reform.

As Burns mentioned, the President proposed to repeal the 7-percent excise tax on automobiles, effective August 15:

> This will mean a reduction in price of about $200 per car. I shall insist that the American auto industry pass this tax reduction on to the nearly 8 million customers who are buying automobiles this year. Lower prices will mean that more people will be able to afford new cars, and every additional 100,000 cars sold means 25,000 new jobs.

Congress did not complete work on the legislation until late in the year. President Nixon signed the Revenue Act of 1971 on December 10. It repealed the 7-percent automobile excise tax retroactive to August 15, the 10-percent excise tax on light-duty trucks (those weighing 10,000 pounds or less gross vehicle weight used primarily for personal transportation), and the manufacturers' tax on urban transit buses. In signing the bill, he said:

> [Just] to give an example, over 3 million automobiles have been sold since the announcement on August 15 was made. That means that an average of $200 per 3 million people will be rebated as a result of the action of Congress. We can see that approximately $600 going to those who purchased automobiles around this Christmas season will be a good shot in the arm for the economy.

The new law required auto manufacturers to refund the automobile excise tax to customers and then claim reimbursement from the Department of the Treasury. Revenue from the excise tax, which previously went to the general Treasury, had been coveted by highway and mass transit advocates but was no longer available for these or any other purpose.

Revenue from the excise tax on light-duty trucks and buses had been credited to the Highway Trust Fund. Elimination of the tax on light-duty trucks was expected to cost $280 million in FY 1972 and $360 million in FY 1973. In addition, repeal of the excise tax on trailers with a gross weight of 10,000 pounds or less used with light-duty trucks would cost the Highway Trust Fund about $3 million. The only offset, about $25 million a year, would come from extension of the tire tax to imported vehicles (bicycles excepted). [*General Explanation of the Revenue Act of 1971*, Public Law 92-178, Prepared by the Staff of the Joint Committee on Internal Revenue Taxation, 92d Congress, 2nd Session, December 15, 1972, p. 84-85]

The Senate amendment transferring a portion of the alcohol tax to the Highway Trust Fund to compensate for the loss of light-truck tax revenue was not in the final bill.

(As for the implication that peace was just around the corner, the Paris Peace Accords on ending the war were signed on January 27, 1973, officially ending U.S. military involvement in the war later that year. The Vietnam War would end in April 1975 with the collapse of South Vietnam.)

Cracks in the Lobby

Throughout 1971, the unified highway lobby was showing cracks in an unlikely place. In Detroit, Michigan, the Ford Motor Company was gradually breaking away from the unified opposition to diversion of Highway Trust Fund revenues. On April 6, Ford vice president Allen W. Merrell had written to Michigan Governor Milliken in response to his proposal to increase the gasoline tax by 2 cents, with a half cent of the increase for mass transit in Michigan's cities:

> While we agree that a portion of the highway funds for urban areas should be available to improve public transportation service we believe that the proposed creation of a special urban transportation discretionary fund separately financed by a one-half cent increase in gasoline taxes would further complicate an already complex financing system.
>
> We believe that the definition should now be broadened to permit limited use of these funds as a supplement to other local, state and federal funds to encourage more intensive use of streets and highways for public transportation including building of shelters, loading platforms, special ramps and lanes for buses, and parking facilities.
>
> We also support use of such funds to aid in purchase of buses.

The company opposed the use of State highway user tax revenue for rail rapid transit, but where it is needed in densely populated urban areas, "we believe that rail transit would be more logically supported by general state or local revenues than by taxes on highway users."

In September, after President Nixon's comment about the Highway Trust Fund during his appearance before the Economic Club of Detroit, Henry Ford II, company chairman, had said that, "slowly and surely you are going to see some of this money used for other purposes." He did not "know whether we're yet ready to suggest that mass transit get money out of the highway trust fund . . . ." However, James M. Roche, chairman of General Motors, said he could see the possibility of highway user tax revenue for transit where "some overlap" of interests existed between motorists and riders of mass transit. Lynn A. Townsend, chairman of Chrysler, also said he thought some special cases might justify diversion, but said after the President's remarks that "a general release of the money for mass transit would be a misuse of these funds."

Now, in the first week of January 1972, Ford brought the subject up again. On January 6, he said during a news conference in a new Ford plant in Flat Rock, Michigan, that he thought some Highway Trust Fund revenue should be diverted toward mass transit. Appearing with company president Lee A. Iacocca, Ford said he did not have a specific amount in mind:

> I don't know whether we're going to be able to sell our ideas . . . . We're in favor of mass transit but it's got be a viable system and can't cost the general public a fortune. We've got to start slowly and take some of the highway trust fund money and use it for research and experimentation . . . maybe build one system if it is a new type to see whether it works before you say you want to earmark X-dollars from the highway fund. [Irvin, Robert W., "Ford Nudges Industry on Tax Use for Buses," *Washington Evening Star*, January 16, 1972]

In a surprise move on January 25, the Big Four auto companies (General Motors, Ford, Chrysler, and American Motors) came out in support of Governor Milliken's gas tax proposal. The companies changed their position for three reasons, as summarized in *The New York Times*:

> [R]ealization that better mass transportation system [sic] was needed if downtown Detroit was to be revitalized; plans by the auto concerns to develop mass transit systems that they eventually hope to manufacture and sell to urban areas, and the rising opposition to cars in downtown areas expressed through street closings and redevelopment plans that exclude automobile traffic. [Salpukas, Agis, "Auto Makers Back Gas Tax for Transit," *The New York Times*, January 26, 1972]

These changes of attitude on the part of traditional highway allies were seen as significant for the pending battle in Congress over the future of the Highway Trust Fund. In a *Times* op-ed ("In Goes Money, Out Comes Concrete"), free lance writer Wade Greene put it this way before the auto companies changed their position on the Michigan gas tax increase:

> Besieged from without by a growing body of urbanists and environmentalists who are bent on stemming what they regard as the reckless graying of America through excessive highway building, the trust fund's supporters now find their own ranks eroding . . . . If Ford's defection is the most dramatic in the highway lobby's defenses, it has not been the only one. Mobil Oil, in an ad in this newspaper, considered the possibility that "special earmarked funds are no longer the best approach" to the country's transportation problems. At its gathering last year, the National Governors' Conference, once a pillar of support for

> the trust fund, voted for incorporating it into an over-all transportation fund, to be used as the states saw fit. And in a direct parallel to the national situation, at least two States, California and Maryland, recently saw fit to permit highway-oriented state taxes to go to nonhighway uses; similar moves are now being debated in other states.

The defeat of Representative Fallon in 1970 and his replacement by Representative Blatnik as chairman of the Committee on Public Works was seen as a hopeful sign for anti-highway forces because Blatnik was viewed as having "a good deal more flexibility about the fund" than his predecessor. Similarly, the defeat of Senator Randolph's proposal to shift alcohol tax revenue to the Highway Trust Fund to make up for loss of revenue from taxes on light trucks was seen as another sign that the sacrosanct Highway Trust Fund no longer had as solid support as in the past.

These signs did not, however, guarantee a change in the use of Highway Trust Fund revenues:

> While opponents of the trust no longer face a monolithic antagonist, they are far from dismissing the persuasiveness of those who are still intent on keeping the fund as it is. "One thing that's fairly obvious," says H.A.C. director John Kramer, "is that these people have an awful lot of money available and this is a campaign year and candidates do need an awful lot of money." [Greene, Wade, "In Goes Money, Out Comes Concrete," *The New York Times*, January 16, 1972]

In February 1972, *The Wall Street Journal* wrote about the highway industry's counter-offensive. In "The Highway Lobby Aims to Prove There is No Highway Lobby," the newspaper described "an intensifying counterattack" aimed at "environmentalists and other critics who contend that highways gobble up land, besmirch the landscape, stimulate traffic congestion and pollution, rip up neighborhoods and soak up taxes." The "new drive and urgency" was inspired by the importance of 1972 as a highway reauthorization year with the question of opening up the Highway Trust Fund to mass transit to be decided. HUFSAM, the article stated, had decided to "take off the kid gloves" to ensure the American people "hear the truth about highway transportation":

> So federal officials are on the attack, seeking to sway the public with prepared speeches, news releases, "fact sheets," brochures and bumper stickers, and singling out certain critics by name. Among them are Helen Leavitt, author of the book "Superhighway-Superhoax" and journalists and columnists whose work has appeared in such publications as the Reader's Digest, Saturday Review, Field & Stream, The New York Times, and The Wall Street Journal.

HUFSAM staff and 17 regional representatives had delivered 140 speeches since the campaign began in the fall of 1971:

> They have debunked, among other things, the superhighway "myth" of the "bulldozer invasion," the "urban-strangulation" myth, the "paving-over-America" myth and even the "myth of the highway lobby." ("If you call those who benefit from highways 'the highway lobby,' then it is the entire American public.")

The industry also had formed TRIP (The Road Information Program) to release radio and newspaper advertisements. TRIP had raised $250,000 in late 1971, but was hoping to raise $1 million in 1972. The *Journal* described one TRIP radio ad:

> In one TRIP radio spot, a woman's voice says: "I almost went off the road today—at that blind curve where the old highway meets Ridge Road." She tells her husband she read about 200,000 miles of primary highways with "blind curves, narrow lanes, things like that!" She says she plans to write the TRIP people and highway officials about fixing the curve, whereupon the announcer chimes in: ". . . Your highways. You've got a lot riding on them."

The article described the origins of FHWA's Resource Book:

> The Federal Highway Administration, meanwhile, has launched a lower-key campaign of its own. About a dozen FHWA officials recently had some meetings to discuss their critics and the criticism itself, then compiled a manual of handy rebuttals . . . . "We didn't want a negative document—we wanted to put together a group of factors to support a highway program," says Steiner M. Silence, an FHWA officials who helped develop the book.

HUFSAM cited a public opinion poll that found that about 80 percent of Americans had a "very or fairly favorable" attitude toward highways. D. Grant Mickle, HUFSAM's president, said the survey "proves so-called public animosity towards highway transportation to be a fiction."

The Highway Action Coalition took exception to that survey, as the article noted. Ben Kelley, the former FHWA public affairs officials, spoke on behalf of the coalition (he was "regarded as a turncoat in highway circles ever since he wrote an antihighway book, 'The Pavers and the Paved'"):

> [Using] other figures from the federation's survey, he says results show only 23% of those interviewed were "very favorable" to highways, while 57% "took the noncommittal middle course of choosing 'fairly favorable.'"

Kelley, the article said, was "a particular bugaboo" for HUFSAM. After he appeared on NBC's *Today* show to criticize highways, a HUFSAM regional official sent a memo to headquarters:

> He complained that the show would get "a hell of a lot of people—especially nincompoop housewives . . . all hot and bothered about the pollution, misuse of *their* taxes – blah, blah, blah." [Karr, Albert R., "The Highway Lobby Aims to Prove There is No Highway Lobby," *The Wall Street Journal*, February 17, 1972]

Just as the pro-highway forces were preparing for what they knew would be a major battle for Federal-aid highway reauthorization in the presidential election year of 1972, the pro-diversion forces were planning their lines of attack. The Highway Action Coalition was ready. An article in Washington's *Evening Star* described the state of readiness:

> Ecological groups, flexing their muscles after helping to down the supersonic transport plane this year, are getting set for a new battle in 1972, this time over highways. Highways, they contend, are slowly strangling the nation. Their theme runs like this:
>
>> Highways grab off more than their share of the federal transportation dollar, seal off urban slums, pollute the air we breathe, contribute to the growing shortage of fuel for heat and light – and breed more highways.

Environmental Action and the Sierra Club, the article stated, were the principal forces behind the Highway Action Coalition, but they were joined by: Americans for Indian Opportunity, Committee for Humane Legislation, Friends of the Earth, Mexican-American Youth Organization, Natural Resources Defense Council, Washington Planning and Housing Association, Wilderness Society, and Zero Population Growth.

> Their goal: To chop off what they call "the monster's head" – the highway trust fund.
>
> Their immediate target: To break loose for other forms of transportation the unused billions of dollars in the trust fund as Congress considers new highway legislation this year.

An article in the coalition's newsletter, *The Concrete Opposition*, stated, "It's a self-perpetuating thing. The more you drive, the more gas you use and the more money flows into the Trust Fund, and more roads are built which encourages you to drive more."

The coalition wanted to open the Highway Trust Fund to all forms of ground transportation in ways, such as the same Federal share, that made the alternatives as attractive as highways:

> The coalition notes that since 1963 more than 100 transit systems have folded. Last year, they say, mass transit nationwide suffered a deficit of $332 million, and the trend is continuing.

As 1972 began, the coalition was "optimistic that public pressure [and] growing official awareness of the problem will come together in 1972 to shift priorities." Members were encouraged by signs of progress. For example, the Senate plan to divert 7 percent of Federal alcohol tax dollars to the Highway Trust Fund in the 1971 tax bill had been killed in conference with the House. "Coalition co-director John Cramer [sic] hailed this as a first defeat for the highway lobby and claimed it showed a growing disenchantment on Capitol Hill with the direction of the highway program." As further evidence, Kramer cited the Proxmire Joint Economic Committee's support in 1970 for abolishing the Highway Trust Fund and the bills introduced in recent years to make Highway Trust Fund revenues available for transit.

One thing was clear. The coalition promised a major legislative initiative in January to keep the momentum going. Kramer said, "Once a sufficiently large, informed and determined constituency is formed and effectively directed toward changing national transportation priorities, our task will be close to completion." The coalition would "bolster local efforts by pooling strength" because the job would not be easy:

> Fighting freeways is not unlike battling with an octopus. One by one you can struggle with and cut off all eight of its arms. But as long as the head is left, the arms are capable of quickly regenerating themselves. [Elder, Shirley, "Ecologists Load Guns for Fight Against Highways," *Washington Evening Star*, December 26, 1971]

The media continued to take aim at the automobile and highway, with early 1972 seeing publication of more critical books:

> Jerome, John, *The Death of the Automobile: The Fatal Effect of the Golden Era, 1955-1970*, W. W. Norton & Company, 1972.
>
> Buel, Ronald A., *Dead End: The Automobile in Mass Transportation*, Prentice-Hall, 1972.

Jerome, whose book was published in January, had been editor of *Sports Car Digest* and *Car and Driver* magazines "in what we self-importantly called automotive journalism." He said he quit "not out of pique or any cold-eyed rational rejection, but because my ardor had simply cooled." After leaving the magazines, he had initially abandoned ownership of a car but purchased one after moving to New Hampshire. Now that he was in the country, he had no choice. He added, however, that "Car ownership nowadays is too difficult, too expensive. Too hard on the conscience." In short, "The premise of this book is that the automobile must go." [Jerome, p. 18-19]

He offered no hope for those who thought the automobile could be improved to eliminate its negative side effects:

> Technology isn't evil, but the uses of technology often are. The car is a bad machine—and the solution is not to build a better bad machine, but rather not to build bad machines. Yet this huge, wealthy nation is trapped with what is virtually a single transportation system, and to suggest simply abandoning that system is to suggest paralyzing the nation. We have become addicted to automobiles; they have become literally a necessity for sustaining life. [p. 21-22]

In his chapter on "The Road," Jerome discussed the role of roads in history, symbolism, and literature. "America is a road epic; we have even developed a body of road art, Huck Finn to *The Grapes of Wrath* to *Easy Rider*, cutting loose to pursue the dream." Now, however, road building had "accelerated to the point of self-parody." He continued:

> With no place else worth opening up, we began building roads to get to roads, roads on top of roads. We ceased to build in service to the noble motivations of interchange and communication. We stopped building roads *to* places. We began building roads *for* automobiles.
>
> It is no coincidence that the initiation of what the Bureau of Public Roads is fond of calling "the largest single public-works project in the history of the world" occurred just as the golden era of the automobile industry was getting under way.

In the mid-1950s, "we seemed capable of coping by conventional methods," but "nobody could misread the production figures emanating from Detroit." The Interstate legislation failed in 1955 "by a whisker" in Congress:

> In 1956—aided, no doubt, by the pressure from 10 million more vehicles—imaginations were a little more fertile. The Interstate Highway System was launched, backed to the hilt by a generous and clever device called the Highway Trust Fund, which decreed that all federal taxes collected on motor vehicles, gasoline, and ancillary equipment would go to build a varicose network of "superhighways," for now and forever, amen, or until completion of the System. [p. 104-105, emphasis in original]

As the "press releases rolled," State highway officials began building the Interstates. By 1971, he said, 32,000 miles were open, but lawsuits had blocked construction in cities around the country. "It had become virtually impossible to gain acceptance for a new Interstate in any major urban area, and many rural segments of the plan—particularly those aimed like concrete daggers at the heart of any scenic or historic spot—were in trouble." [p. 105-106] The Interstate System was not the only road building concept "that has gone awry" in America:

> But it is the most visible, and generates the most criticism. As the biggest, most expensive, most disruptive, and undoubtedly the most graft-ridden roadway project in history, this fifteen-year exercise in conspicuous tax consumption is as eloquently symbolic of what went wrong with road-building as the 1970 Impala is symbolic of what went wrong with car-building. [p. 109]

The highway lobby was behind the whole scheme. AASHO, for example, was "one of the visible tips of the highway-lobby iceberg," but it was joined by car manufacturers, oil companies, steel makers, tire makers, truckers, and ARBA and AGC, plus lobbying groups such as HUFSAM. "One might expect such a congruence of economic, political, military, and public support to provide a sufficient momentum to pave the entire nation, and for a decade and a half there seemed little likelihood of any other fate. We *had* to pave, of course, for the *cars*." [Jerome, p. 113-115] In bullet-points, he summarized the result:

- Highway projects systematically devastate ghettos, historical regions, and park [sic].
- Highways kill inner-city retail activity.
- The automobile commuter is the specific disaster that is killing the cities. Freeways make him possible.
- Highways remove property from the tax rolls at the very time when the cities are starving for revenue.
- Multilane, limited-access roads concentrate high-speed traffic at dangerous levels.
- Highway programs tend to turn into a Big Casino for land speculators . . . . Watch the freeway go in, see the Big Rich get richer.
- Growing public demand for local control has no place in the road-making mechanism.
- Highways are planned on the basis of highway use, rather than as adjuncts to a community.
- Roads make community designers out of land speculators.

- Roads, tend, at worst, to increase our population imbalance at current marginally operable levels; at best, they freeze the imbalance at current marginally operable levels.
- Road construction in the developed portion of the nation destroys housing (usually the low-cost variety, of course) at a time when there is a critical shortage of that commodity, a vitally more important basic requirement than mobility.
- The Interstate System and similar long-haul roadways subsidize commercial users at the expense of private users.
- Road-building programs militate against development of workable public transit systems.
- While at the urban end roads cause congestion, tax depletion, urban flight, and a host of environmental disasters, at the rural end they simply cost too much.
- Highways increase congestion.
- Highways are aimed at providing convenient routes between more and more distant points, at reduced traffic levels.
- Besides, nobody knows how to make highways work. For automobiles, yes; for the nation, for the public that pays for them, that is dislocated by them, not yet. Very likely never. [p. 116-121, bullet points abbreviated]

In concluding his chapter on "The Road," Jerome asked, "If we could not solve the problem with 100 million vehicles, how can we hope to with 200 or 300 million?" He continued:

> It isn't going to get any better as long as we have automobiles as the sole basis of our transportation system, and twenty-five years of experience has pushed us to no cleverer solution than to build more roads to hold the more cars that we've built and bought. But twenty-five years have kept the pressure on; maybe with another twenty-five under our belts, we will begin to think of new ways to go. Or maybe we won't go at all. On examination, the latter course seems much more probable. The question seems to be whether we will choose that course or be forced into it. [p. 124]

Buel, a former reporter with *The Wall Street Journal*, said that his book, released in March, "aims to take a small but important part of America—its transportation system, and even more specifically, its urban transportation network—and to put this small piece in the political and social context of what ails us as a people." [Buel, p. 1] The automobile had "become the very symbol, the epitome of our leisure culture, our consumerism, our unnecessary affluence." [p. 7] It left behind "a large minority of poverty-stricken people" who were not served by our "automobile-highway system." [p. 9]

As for freeways, they are "in a very important way, inherently destructive of the landscape through which they pass, be it urban or rural." Moreover, "no unusual artistic perception" was required "to see that our freeways are ugly things," especially compared to the "fine highways built in the past," such as the Columbia Gorge Highway in Oregon and the Wilson River Highway connecting Portland with Tillamook, Oregon. [p. 78]

Despite the problems caused by highways, "you must be careful not to identify the highway engineer as too much the evil villain." He explained:

> He may often be a pedestrian bureaucrat who does his job and no more, but we must not fault him too much for his failure to have a larger vision. For he is not encouraged or trained to have a larger vision. And the rewards of taking pains with highways, of doing more than is asked for, are totally negative. [p. 85]
>
> For freeway design, as closely as one can tell, is in the control of people with uniformly narrow vision and aesthetic sensitivity, from the top man in the Bureau of Public Roads to the lowest of the lowly highway bureaucrats . . . . Our freeway system is the world's most gigantic construction project, yet we have executed it totally without regard to the simplest of design principles—principles that can be understood and observed by any layman, principles that the American public would pay for if their highway experts and politicians would only ask, principles that, if followed, could have lightened the burden of living in this difficult time. [p. 93]

Buel had several suggestions:

- First, planning goals ought not to be uniform throughout the nation.
- Second, it is not practically possible to completely divorce decisions about major public expenditures, such as freeways, from the political process.
- Third, another important principle is that freeway planning must start from its gross effects on land use and traffic patterns.
- Fourth, a flexible and just method of financing freeways must be found. [p. 97-100]

Buel conceded that "deciding with any degree of finality whether or not more freeways are needed is not possible, in the abstract." The question, after all, was not whether freeway A or freeway B was needed:

> My *opinion* is that if we start making that decision in a large enough context, and we consider alternative ways the funds might be spent to fill transportation needs, we would build far fewer urban freeways in the next decade than we are likely to under present circumstances. For this reason, a politician who called for a total moratorium on freeway building would probably be more right than wrong. For once the freeway is built it is not likely to be torn down, and once it is built it is likely to stimulate demand for more of the same. I say let's have a moratorium on urban freeways. [p. 112, emphasis in original]

In a chapter on "Alternatives to the Automobile," Buel said that just because someone uses highways does not mean "he wants to be taxed to make that highway system grow." Buel, for example, would rather see his highway user taxes go to mass transit projects such as BART and other new rapid rail systems. On a smaller scale he praised the 14.5-mile Lindenwold rail line linking Camden, New Jersey, and Philadelphia, the high-speed Metroliner service linking New York City and Washington, urban cable car service, bicycles and walking, moving sidewalks, buses, jitneys, carpools, and experimental subscription bus services in Peoria, Illinois, and Flint, Michigan (although he conceded the Flint service was a failure). Because each city was unique, the blend of alternatives would vary around the country. "What is important is that we force the political system to narrow the options, and not allow the technicians to continue to do the narrowing for the politicians." [p. 163, 174-210]

In response to such pressure, the highway lobbyists would try to maintain the status quo. "Their representatives are full-time at the legislature. They can 'stay with' the things that they care about, get to know the legislators, follow the bills closely, ingratiate themselves with dinners, drinks, favors, and one suspects, a smidgeon of cold cash from time to time." [p. 224] In 1968, for example, ARBA organized a $50-a-plate dinner for Representative Fallon, raising $13,000. "This included $1,000 each from two Pennsylvania contractors, $500 from a California cement lobbyist, and $850 from thirteen South Dakota road builders." Former Administrator Bridwell had said in an interview in the February 1968 issue of *Architectural Forum* that, "Every time I say no to a highway, you can bet there will be a governor, a senator, and some representative on the phone in 45 minutes." What was needed, Buel thought, was a new breed of politicians who were "not looking for fast results, but willing to build the sort of political involvement and participation by all groups and types of people that insures that, at least at the local level, government will have to respond to people's needs and be financed at a level commensurate with the task." [p. 228, 230-231]

A review in *The New York Times* said that, "Like a modern Don Quixote, Mr. Buel flails out in many directions," but added that "if books like this speed the nation's trip toward more reliance on mass transportation, then Mr. Buel has performed a service." [Fowler, Elizabeth M., "Love Affair Ended?" *The New York Times*, March 5, 1972]

Despite the continued negative publicity, HUFSAM, as evidenced by its campaign motto of "Let's Keep the Trust," and other highway boosters intended to fight hard in Congress in 1972.

Bottomless Pits

On January 20, 1972, President Nixon delivered his State of the Union Address. After discussing his foreign policy goals, including peace in Vietnam, he turned to domestic affairs. His General Revenue Sharing plan, still pending in Congress, was a priority as was his proposed reorganization of the Executive Branch. He mentioned the transportation successes of recent years, including the Urban Mass Transportation Assistance Act of 1970 and creation of the Airport and Airway Trust fund. Building on these successes, he hoped the 92nd Congress would approve Special Revenue Sharing for Transportation "so that cities and States can make better long-range plans with greater freedom to achieve their own proper balance among the many modes of transportation." He added:

> Highway building has been our first priority—and our greatest success story—in the past two decades. Now we must write a similar success story for mass transportation in the 1970's.

He said his budget would propose a 65-percent increase, to $1 billion (up from $600 million in FY 1972), for mass transportation. The funding would help cities buy buses, build subways, and meet other capital costs in FY 1973.

Senator Harrison Williams, chairman of the Housing and Urban Affairs Subcommittee, decided to take on the issue of operating subsidies without waiting for Administration support. He held a hearing on January 31, 1972, on his bill to provide $150 million in subsidies as a stopgap for transit systems around the country. Carmack Cochran, president of the American Transit Association, said his privately owned transit company in Nashville, Tennessee, "could not exist out of the fare box if we were given the unlimited power to raise fares." The transit industry, he said, cannot provide an efficient and cheap alternative to the private care. "To the contrary, the peculiar economics of transit mean that if the present trends continue, it will provide less service to few [sic] people at higher cost." He and Dr. Ronan of the New York Metropolitan Transportation Authority (MTA) estimated a national need of $400 million a year in subsidies.

As Cochran's comments indicated, many cities were still in transition from privately owned transit services, such as his company, to public ownership. On February 1, Mayor Thomas A. Luken of Cincinnati, Ohio, told the subcommittee that Cincinnati Transit, Inc., "is dying a slow death, and there seems to be precious little time left." The city did not have the money to rescue the company or take over its service. Saying he rode the bus to work, he blamed highway investment:

> We cannot continue to build countless miles of highway and expressway and to crowd them with innumerable vehicles, as we have been doing. From an environmental standpoint, if nothing else, we must have a mass transportation system . . . and we cannot . . . unless there is comprehensive federal assistance forthcoming.

Secretary Volpe declined an invitation to testify, saying his testimony would "serve no useful purpose." The Department of Transportation had recommended further study of subsidies in its November 1971 report to Congress and indicated that they were not necessarily as appealing as other measures, such as expanded use of reserved bus lanes, to aid the industry by making the service more attractive. As for Secretary Volpe's decision not to testify, Senator Williams said, "Only one conclusion can be drawn. Despite presidential pronouncements, the administration is really indifferent to the commuter's plight." [Eisen, Jack, "Transit Leaders Plead for Subsidy at Senate Hearing," February 1, 1972, and "City Transit Dying, Hill Told," *The Washington Post*, February 2, 1972]

While Senator Williams was holding a second day of hearings on February 1, Administrator Villarreal revealed in an interview that the Department was considering subsidies. He and other Department officials had met in January with the U.S. Conference of Mayors, the National Governors' Conference, the National League of Cities, representatives of the transit industry, and others to "identify alternatives for implementing a program of transit assistance based on incentives." With a smile, he emphasized that, "We don't call them 'operating subsidies.'" *The New York Times* reported his comments:

> "The big question," he said, "is will operating subsidies really improve public transportation?"
>
> He noted that Mr. Volpe's past opposition to the subsidies had been influenced by his experience as Governor of Massachusetts, where a local subsidy to the Massachusetts Bay

> Transportation Authority "started at $4-million a year two decades ago and is now more than $60-million.
>
> "For a government subsidy to really improve transit, it has to be implemented in such a way that it improved service," Mr. Villarreal said, and that is why the Administration is seeking to devise a plan that would tie the Federal aid to improvements of service and emphasis on efficient operations.

An anonymous source in the Department told the *Times*:

> One thing we're very concerned with is the transit unions. We don't want to set up Federal subsidies that they can use as a blank check, coming back year after year for more because they think subsidies are unlimited. It's one of the biggest problems, and tat's [sic] why we want to have incentives for efficiency. [Lindsey, Robert, "U.S. is Considering Mass-Transit Aid," *The New York Times*, February 2, 1972]

The Nixon Administration, like Republicans generally, was suspicious of unions, which tended to support Democratic candidates. Across the transportation spectrum, the Administration and especially Secretary Volpe had been confronted with union demands, strikes, and threats of strikes to stop rail, air, and shipping service. (In early 1972, 13,000 dock workers were on strike on the West Coast.) The Administration had proposed legislation that would, as the Secretary told the National Transportation Institute on February 2, "amend our hopelessly antiquated transportation labor relations legislation." He was referring to the proposed Transportation Regulatory Modernization Act of 1971 and the Transportation Assistance Act of 1971. Such changes were needed because the transportation modes could not solve the problems alone. He cited transit as an example:

> This is a challenge the transit industry cannot solve by itself. This alone is a persuasive argument for President Nixon's proposed department of community development to be created under his executive reorganization program.

Urban mass transit systems would collapse in chaos, he said, unless "we take prompt and decisive action." Federal mass transit had helped stabilize bus transit systems in 60 U.S. cities and helped purchase 7,900 buses and 1,100 rapid transit rail cars, but the real answer was for urban transit planners and city planners to produce systems that "combine transportation, housing, shopping, schools, jobs, and all the rest into total communities." [Rokeach, Morey, "Volpe Urges Transport Labor Laws," *The Journal of Commerce*, February 3, 1972; and Associated Press, "Volpe Urges Action Now on Urban Transit," *The Washington Post*, February 3, 1972]

On February 17, the Senate Banking and Urban Affairs Subcommittee approved operating subsidies for urban transit systems as part of the Housing bill. Senator Williams had prepared the final version, which would let the Department of Transportation dip into $3.1 billion in authorized capital-outlay funds to provide the subsidies. Private companies could receive subsidies if the application were submitted by a public agency willing to pay one-third of the company's losses.

The approved bill also increased the Federal share to 90 percent, from two-thirds, for transit construction and equipment purchases.

When the bill reached the Senate floor, Senator Jacob K. Javits (R-NY) introduced an amendment that changed the subsidy measure by taking $400 million a year from the general Treasury for FYs 1973 and 1974. He argued that the Department of Transportation capital grant fund was already running short of needs. Senator Gordon Allott (R-Co.), a transit supporter, tried to strip the bill of the subsidy provision; he introduced a letter from Secretary Volpe saying the Administration did not support operating subsidies. Allott's effort failed, 53 to 26. The Senate approved the Housing bill, 80 to 1, on March 2. With Senate passage, the Housing and Urban Development Act of 1972 would await House action. [Herbers, John, "Senate Approves Housing Program Aiding Big Cities," *The New York Times*, March 3, 1972; "Senate Okays Transit Funds," *The Journal of Commerce*, March 7, 1972]

Transit interests and local officials were optimistic. *The Wall Street Journal* headlined a May 9 article:

City Transit Systems At Long Last Likely to Get Federal Aid

The subheads read:

Advocates Sat It Can Revive Deteriorating Local Lines;
Critics See Bottomless Pit

Hemorrhaging in New Jersey

The $800 million provision in the Senate housing bill offered the relief cities were seeking "to stave off bankruptcy or shutdown." Burke, the transit lobbyist, "figures that with 250 Representatives hailing from districts with locally subsidized transit systems, there's a solid base of support in the 435-member House." It was clear, the article said, that "the chamber's attitude toward operating subsidies, glacial only two years ago, has warmed up greatly." Representative Joel Broyhill, described as a conservative Republican from northern Virginia, was cited as an example. "Subsidy has always been obnoxious to me," he said, "but in local transit there ain't no other way."

The article reported some movement within the Administration:

> Transportation Secretary John A. Volpe, who had viewed such assistance as pouring money into "bottomless pits," is said to have swung around to the view that the administration should offer a subsidy plan. "You just can't let service blow away because the problem is so complex," a Transportation Department official says. Besides, he adds, "they're getting impatient on Capitol Hill, and the Secretary is quite sensitive to it."

As the Secretary's comment about "bottomless pits" suggested, the article said, critics feared that operating subsidies "would become a massive, ever-expanding boondoggle, enmeshing the government in the maddening day-to-day affairs of transit operations." That fear had prompted

Senator Allot to try to block the subsidy provision despite his support for public transportation. He saw it as subsidizing "the worst systems, the worst management, the worst operation, the worst overloading of personnel—everything that is bad about the operation of any system." He added, "I can only liken it to welfare in its potential for spending money with little benefit." [Karr, Albert R., "City Transit System At Long Last Likely to Get Federal Aid," *The Wall Street Journal*, May 9, 1972]

While mass transit advocates were following the subsidy measure in the House and Senate housing bills, advocates also were pursuing their biggest challenge: diverting revenue from the Highway Trust Fund to transit.

An Efficient and Balanced System

On December 30, 1971, Secretary Volpe issued a statement in advance of a press conference to say "the Department of Transportation has reached a turning point in its drive to establish a foundation for an efficient and balanced transportation system." Through intermodal planning and enactment of legislation since the Department's creation 3 years earlier, the Department was on its way to curing the country's current transportation problems even as a system was being shaped for addressing future needs:

> We have made very important progress in putting together the transportation plans and programs which will unclog our streets, facilitate air traffic, reduce fatal accidents, revive and revitalize railroad and public transportation and, in general, create a balanced system which will adequately serve the public and enhance the quality of American life. We can now look forward to completing our mission, fully mindful of the Presidential admonition to increase transportation capacity without damaging our land, our environment or our social fabric.

Recent legislation had established programs to meet the most pressing needs. For example, the Urban Mass Transportation Assistance Act of 1970, which committed $10 billion over 12 years, made possible "a significant start toward checking the decline in urban mass transit systems and rebuilding them to a point where they can provide the necessary service." By July 1972, the Department will have allocated about a billion dollars to improve public transportation. In a joint intermodal effort, financing was being provided for express lanes for buses in five cities thus far, with FHWA funding the lanes while UMTA funded new, modern buses.

After discussing rail and air needs, the St. Lawrence Seaway, and the United States Coast Guard (all within the Department's jurisdiction), he turned to highway safety. Great strides had been made, he said, thanks to the efforts of FHWA and NHTSA. The rate of highway traffic fatalities had continued to decline during 1971. (The fatality rate declined from 4.85 deaths per 100 million miles traveled in 1970 to 4.57 deaths in 1971.) Unfortunately, "a similar decline in total deaths on the highways may not be achieved this year because of the greatly increased number of miles traveled by American motorists." (The number of fatalities rose slightly, from 53,816 deaths in 1970 to 53,907 deaths in 1971.) Still, he expected a "sharp reduction" when "the full impact" of the safety measures put into effect by the Department is felt.

He also discussed the positive effects of the Federal-Aid Highway Act of 1970. In addition to continuing construction of the Interstate System, the 1970 Act provided for "more liberal use of highway trust funds" for safety, highway beautification, replacement housing, roadside parks, bicycle trails, and other environmental improvements. The Act also allowed the use of the funds "for augmenting the urban mass transportation program." In these ways, the legislation "contributed to the overall goals of the Department."

In addition, by authorizing the use of Highway Trust funds for roadside parks, bicycle trails, and other environmental improvements, the 1970 Act was "contributing substantially to the ecological program to which all agencies of the Department are committed." Further, the Department had "been able to mount an effective program for removal of non-conforming outdoor advertising signs along the Interstate and primary road system" thanks to the new provisions and funding of the 1970 Act. He said that 40 States and other jurisdictions were in compliance with billboard removal requirements of the Highway Beautification Act of 1965.

The Secretary's statement also mentioned the use of Highway Trust Fund revenue to provide replacement housing that he said "helped to minimize hardship suffered by those whose homes lie in the path of transportation projects." The Department "adheres rigidly to its policy that safe, sanitary and suitable housing much be available before any family is displaced."

For anti-highway forces, the surplus in the Highway Trust Fund had become an increasingly appealing target in the search for revenue—seeming to be a large amount of unneeded highway money that could be shifted to transit. When an editorial in *The New York Times* ("Priorities in Transit") on January 10, 1972, stated that the Highway Trust Fund "will . . . have an accumulated surplus of over $4 billion at the end of the fiscal year 1972," HUFSAM's J. C. Martin wrote to inform the editors that, "This is simply not true." Published on January 22 under the heading "A Surplus That Isn't," Martin's letter explained:

> The "surplus" you refer to is nothing more than a cash balance in the trust fund, similar to the balance any one of us might have in a checking account. Although the money appears to be available, it is already obligated to certain expenses—in the case of the Highway Trust Fund, to highway projects now being constructed by the State.
>
> In fact, although the cash balance in the trust fund is now about $3.6-billion, the fund's liability is more than twice as much, about $7.5 billion.

His explanation and use of the checking account analogy were correct, but repeated explanations of the balance had little impact on the debates. The problem arises because the Federal-aid highway program operates on a reimbursement basis. It obligates funds for a project, but those funds remain in the Highway Trust Fund account until the State incurs expenditures and submits vouchers for progress payments during completion of the project. Larger projects take more than 1 year to complete, so funds obligated for them will remain in the account for months, even years despite being committed to that project.

(FHWA still addresses the issue, for example in its publication *Financing Federal-Aid Highways*:

> The balance of the HTF has long been a point of controversy. Because of the nature of a reimbursable program like the FAHP, there may be cash in the fund that is not needed for immediate use. It is important to understand that this is not necessarily excess cash but will be needed to reimburse the States as vouchers are submitted.
>
> Perhaps a comparison of the HTF operation to a personal financial situation can help clarify this point. If a person has a checking account balance of $500, that amount cannot be considered in excess if he or she has at the same time outstanding monthly bills of $1,000, but neither is the account in a deficit situation if he or she will receive $1,200 in a paycheck at the end of the month.
>
> The HTF operates in the same manner. [*Financing Federal-Aid Highways*, FHWA, 2007, p. 35, http://www.fhwa.dot.gov/reports/financingfederalaid/])

As work began in 1972 on Federal-aid legislation, congressional leaders were convinced that as Chairman Kluczynski put it at the start of the Subcommittee on Roads hearing, the pending legislation "could be the most far-reaching and important piece of legislation to be produced in the highway field since the passage of the 1956 act creating and funding the Interstate Highway System." Because of the elections in November 1972, the schedule for approving the legislation would be tight. He would delay hearings on the Federal-aid highway program until he received the Highway Needs Report, which was then being held in OMB, or if not the report, the Department of Transportation's recommendations. [*1972 Highway Legislation*, Hearings before the Subcommittee on Roads of the Committee on Public Works, House of Representatives, 92nd Session 2nd Session, Committee Print 92-32, p. 1]

Instead, the initial stage of the Subcommittee's hearings, which began on February 17, was devoted to highway safety. While hearings continued on that important topic through February 24, the Subcommittee on Housing of the Committee on Banking and Currency held a 1-day hearing on February 23 on Urban Mass Transportation. In introductory comments, Chairman William A. Barrett (D-Pa) said:

> The subcommittee has before it at this time over 100 bills to authorize the Federal Government to provide financial assistance for the operating expenses of urban mass transportation systems. I have serious questions regarding this proposal since I believe it commits the Federal government to subsidize the operations of transit companies without the establishment of any criteria for good management techniques. But, I approach this hearing with an open mind and I am willing to consider all of the arguments.

During the course of the day, every witness rejected the recommendation in the Department of Transportation's November 1971 report that further study of the issue is needed. Mayor Daley of Chicago, representing the U.S. Conference of Mayors/National League of Cities, said the organizations agreed with the report's findings "but we can't understand how the Department's report reached its conclusions." Instead of recommending action, the report recommended further study that "would cause at least a 3-year delay in facing a problem which the Department of Transportation admits is 'severe.'" He said, "We are satisfied that enough study has been done and enough information exists on which to make the basic policy decision." [*Urban Mass Transportation*, Hearing before the Subcommittee on Housing, Committee on banking and Currency, U.S. House of Representatives, 92nd Congress, 2nd Session, February 23, 1972, p. 6, 15]

Representative Rostenkowski, accompanying Mayor Daley, said:

> We have been promised action by the administration, but we were cautioned to wait until all the findings were reported. Mr. Chairman, we in the Congress waited until the administration submitted its report of the problem. Unfortunately, many of us cannot agree with the observations in this report. Many of our larger cities can not wait for "more study" . . . they need help, and need it now. [*Urban*, p. 31]

Representative Koch referred to the opening line in the report about the "severe problems" facing transit operators and communities. "Unfortunately, the Department still seems to be bound by a policy of 'go slow on mass transit' that has reduced by 1/3 the mass transit capital program authorized by Congress for 1972—just as it was reduced by 1/3 in FY 1971." As for the Department's call for more study, Koch said:

> My own position is—and I make this plea to the Committee—that while we admittedly don't have all the answers, we do have the answer to the fundamental question of whether we can afford to ignore the problems of our transit systems. The answer is an unequivocal, NO. Furthermore we know that the states and localities alone cannot meet the need; federal assistance must be provided in meeting operating costs. [*Urban*, p. 42-43]

Several witnesses discussed the fear that subsidies would turn into a "bottomless pit." Dr. Ronan stated that the $400 million requested for subsidizing operation and maintenance costs "would not be a 'bottomless pit' into which public moneys would be poured." He said that a "very specific auditable element would be involved," such as the "maintenance-of-way type of expenditure." A formula "designed to equate to the productivity of the system in carrying passengers" would avoid the "bottomless pit" argument "by equating the Federal payment to the service performed in carrying passengers; it avoids any measure of the extent of deficit incurred or relative efficiencies of operations" [*Urban*, p. 52, 55]

All the witnesses favored Federal operating subsidies; parity in the Federal-State matching ratio for the capital grants program and the highway program; adoption of contract authority for the funding under the 1970 Urban Mass Transportation Act; and separate funding for the metropolitan planning process. They opposed the reduction of authorized funds through the appropriations process.

The Subcommittee on Roads turned to the highway phase of hearings on March 1. With the Interstate System nearing completion, Kluczynski mentioned that its construction had taken priority over the regular rural and urban highway networks. "We must now turn to these neglected needs and move ahead with a program of highway improvements which will gradually transit from the Interstate emphasis to one which will reach into the undeveloped areas of the country, increase the safety and efficiency of our primary and secondary systems, and upgrade the long neglected street system in the urban areas." He did not mention mass transit. [*1972 Highway Legislation*, p. 289]

Ranking Republican Harsha agreed that the concentration on the Interstates had "created a tremendous backlog" of unmet highway needs:

> Our transportation needs are great. Our resources are limited. But I firmly believe that we will be able to provide the legislative blueprint for building a balanced, integrated, transportation network suited to the Nation's highway needs through the 1990's. [*1972 Highway Legislation*, p. 289-290]

On March 2, Kheel and Kramer of the Highway Action Coalition, appeared as witnesses. In a prepared statement, Kheel explained that in the absence of the Highway Needs Report or an Administration proposal, he would focus on AASHO's recommendations, because over the years, they often have been influential in establishing Federal-aid legislation. Under AASHO's proposal, Interstate authorizations would drop while the Federal share of projects on the "ABCD" systems would increase from 50 to 70 percent. ("ABCD" was highway jargon for the Federal-aid primary, secondary, urban extensions, and urban systems.) AASHO wanted to increase the authority of the States to shift funds among the ABCD systems from 20 percent to 50 percent. It also asked Congress to authorize funds on a 4-year instead of a 2-year basis.

Kheel said that in the coalition's view, "there are simply far more pressing priorities and needs than constructing still more highways." Since establishment of the Interstate program in 1956, "the transportation needs and priorities of the country have changed considerably." Despite the investment in Interstates, he said:

> [T]hey don't even serve the real needs of the highway user: year after year billions of man hours are needlessly lost as people and goods are stalled in endless traffic jams—thus defeating the original purpose of the highway program, namely the efficient, safe movement of people and goods.

While highways were failing to meet the needs they were intended to address, "we have allowed many of our other surface transportation systems to wither and die." More than 100 private transit systems had disappeared while mass transit "suffered a collective deficit of $332 million dollars" in 1971. Projections indicated an additional $28 million would be added in 1972 to the "sea of red ink." The coalition supported a single Federal Surface Transportation Trust Fund that would incorporate the Highway Trust Fund and be available for "any valid ground transportation use without prejudice to mode." This change would allow local officials to "look at the total transportation needs of a given area" on a needs basis. "It is within such a framework that the nation could achieve what it lacks now and so desperately requires: namely, a balanced, fully coordinated transportation system." Such a network was essential, especially for the poor who could not afford to buy automobiles.

He cited recent developments among the Big 4 automakers, including Henry Ford II's support for diversion of Highway Trust Fund revenues for mass transit. He also referred to Mobil Oil Corporation's full-page advertisement in *The New York Times* on January 21, 1972, headlined:

It said:

> Indefinite continuation of the Highway Trust Fund could deter construction of more urgently needed non-highway transportation facilities . . . . Highways are important to us obviously. Highway travel builds sales for Mobil. But traffic jams, and a glut of cars using too much gasoline to haul too few passengers, waste many resources, including oil.

After quoting the Mobil add, Kheel concluded his prepared statement:

> Gentlemen, the need for change is apparent and pressing. Momentum is beginning to build for a thorough reordering of transportation priorities. I hope this Subcommittee will play a leading role in bringing about the necessary changes. [*1972 Highway Legislation*, p. 317-322, the complete Mobil ad is reprinted on p. 323-324; a January 20 Mobil ad titled "Let's Get Moving With a National Master Transportation Program," is on p.324-325]

In a brief oral statement, Kheel said:

> In a country that emphasizes its fairness, that relies upon freedom of choice, we have gone out of our way to subsidize one form of transportation. The moneys that we spend for the people that use their automobile are totally disproportionate to the moneys we spend for mass transportation.
>
> There was a time when the general belief in this country was that there should be no subsidies of any sort for any purpose. We have come a long way from there. We now subsidize highways up to a 90-10 matching ratio that encourages the States to divert funds from other pressing needs to get those 10-cent dollars from the Federal Government.
>
> It is a form of addiction similar to the pusher in the schools of our Nation who tries to get the kids on dope so that they will have to go out and get more money.

This statement aggravated the subcommittee members. Representative Schwengel referred to the 74 days of testimony leading up to the 1956 Act. "We were launching a pay as you go plan . . . . But to compare this to a pusher is a pretty extreme statement. I just have to tell you that I resent that as a Member of Congress, that kind of an analogy."

Kheel said "I apologize if I have offended you . . . but I do believe first of all that this is a subsidy program because the tax moneys would otherwise go into the general treasury." He was going to continue, but Representative Cleveland interrupted. "I just don't understand what you are saying." The highway user taxes were user fees, he said, not subsidies.

Kheel responded that "if we applied this user principle to all forms of taxation . . . there would not be any moneys available to pay your salaries." He began to elaborate on this theme but Cleveland interrupted him again. "I don't think we have a meeting of the minds at all," adding "I think you weaken your case when you speak of this as being a subsidy. [*1972 Highway Legislation*, p. 327]

Trying to divert attention from the subsidy issue, Kramer said that while user taxes paid for the Federal-aid highway program, "we simply cannot accept the proposition that these taxes pay the entire cost of the roads program." Trying to clean air pollution, largely caused by motor vehicles especially in urban areas, is just one of the external costs that are not funded by highway users. He started to talk about the effects of motor vehicles on agriculture but was interrupted by Representatives Schwengel and Cleveland, who said that when Kramer said the Federal Government was subsidizing highways, "I just don't think you are using the English language the way I do." [*1972 Highway Legislation*, p. 328]

Representative Schwengel pointed out that if the finite amount of Highway Trust Fund revenues could be used for mass transit, when they were divided among the 50 States, "you would not have a drop in the bucket compared to the total need." That, Kheel replied, "would be no reason we should not start." The implication, Kneel said, was that if enough money is not available for all needs, "none of it should be made available." Schwengel said, "we should look at the total problem and have a total plan to finance it." Kheel replied, "precisely." [*1972 Highway Legislation*, p. 330]

Representative James J. Howard (D-NJ) turned to the issue of congressional committee jurisdiction, acknowledging that a single transportation committee might be desirable. "I introduced a resolution in this Congress, it was so popular that it got no cosponsors, that would create a new committee in the Congress . . . that would have the jurisdiction over land, sea, and air, people and goods, for the entire country." Since that bill went nowhere, when the Department of Transportation wanted to discuss a balanced transportation system, "they have to come down here and talk to the Public Works Committee about this highway need."

Kheel agreed "emphatically" that a single transportation committee would be preferable. But Kramer said:

> I submit that the Congress must begin now—notwithstanding the present confusion over committee jurisdictions—to address the problem of transportation as a whole and authorize appropriations on the basis of need rather than of mode. And this in turn brings me back to our original problem of enormous pools of money being available for one mode and not for others . . . .
>
> We know that not all of the transportation needs of the country can be met overnight, but we do think if there is a single fund, the most pressing needs, whether they are highway needs—and I am thinking particularly in the safety areas such as bridge replacements and so on—or whether they be public transportation needs—such as operating subsidies for existing systems—the relative urgency of each of these needs can be meaningfully evaluated and money can be authorized and appropriated accordingly. [*1972 Highway Legislation*, p. 330-332]

Representative Schwengel asked how to pay for the total solution. Since, as Kheel said, enough money would never be available for all highway and mass transportation needs, he thought the best idea was to focus money on which option is needed rather than directing the bulk of the available funds to highways. The Representative suggested he might support a separate trust fund for mass transit, but did not like the idea of saying, "We are going to open up the trust fund and give you a little money there."

Kheel favored opening the Highway Trust Fund to pay for a balanced transportation program:

> You have given them [highways] 16 years of the exclusive dedication of the taxes that I pay . . . . You have also disregarded, as Mr. Kramer pointed out, the incidental costs to the community of air pollution and of traffic congestion.

As for those costs, Schwengel pointed out that they had to be balanced against the savings resulting from the Interstate System. Truckers, for example, can get their product to its destination faster. Kheel replied, "They come to the urban communities, and they go 50 percent slower today."

The Representative blamed that problem on urban communities that did not take "full advantage of the laws to build their highways." Kheel did not agree:

> One thing has become patently clear. That is that the more highways you build in urban areas, the more traffic congestion you get. It is self-defeating. [*1972 Highway Legislation*, p. 334-335]

Representative Harsha asked Kheel and Kramer how to get people to use mass transit, which was failing financially because of the lack of sufficient riders. Kheel said that, "People are influenced by the cost, and if they are given a good ride at a good price, they will use mass transportation." Transit could not be self-supporting, "but it will save us moneys." He added:

> This has to be done, but it has to be done by bringing down the price, or not letting it go higher, and improving the quality, and that is why we need a balanced approach.

Representative Howard saw a contradiction in Kheel's reply:

> I understand all that, but your argument seems to me to be self-defeating. If you are going to make these highways so attractive, and so enjoyable to ride on by reducing the number of people on it, you are going again to encourage the use of the highways by the car operators. This is an age of convenience, and the automobile is a much more convenient mode of transportation than mass transportation.

When Kheel replied that automobile travel was more costly, Representative Harsha said, "That depends on which end of the carrot you are looking at as to what the costs are." Despite all the environmental harms Kheel and Kramer cited, "you still can't get people to use mass transit systems." He pointed out that localities have to subsidize fares Kheel said, "Competition is a great thing in our society, and I am all for it, but we can't have the competition in transportation." [*1972 Highway Legislation*, p. 337-339]

In closing, Kheel said:

> I believe your committee can make a major contribution toward a balanced system, toward an overall approach, toward opening up the Highway Trust Fund, not abolishing it, toward opening it up and using the moneys not just to hand out willy nilly, but with planning and intelligence to achieve an objective.
>
> I would like to see, of course, a restructuring of the Congress for this purpose, but in the meantime, there is this committee, a most important committee, that gave birth to the Highway Trust Fund, and think you have a great opportunity. The time has come, as reflected by the statements of Mr. Ford, the Auto Makers, and the Mobil Oil Corp. all of which have been the primary beneficiaries of the Highway Trust Fund.
>
> They are sometimes referred to as the highway lobby. I do not use that term. I do say that these are people who realize that their own interests depend on the public interest, and that the time has come when such an approach is indicated and that that is the appropriate committee to take that action.

Representative Howard thanked Kheel "for your courage this morning." [*1972 Highway Legislation*, p. 342]

On March 9, the subcommittee heard from ARBA. President Edward H. Holt, vice president of construction equipment manufacturer Barber-Greene Company, said that the "highway mode of transport has the adaptability and flexibility to supply the major portion of the total transportation requirements for our great country." To take full advantage of "the highways we have and provide the additional highway facilities," the new legislation must:

> No. 1, insure the continuity of adequate funding on a sustained, forward planning basis.
> No. 2, we must harmonize transportation and environmental goals with a full consideration of the cost and aesthetic factors involved.
> No. 3, we must take care to protect the Federal interest in the administration of the Federal-aid highway program; but, at the same time, to eliminate those Federal controls and procedures which produce more delay and confusion than they do beneficial results.

Regarding the second point, Holt stated that ARBA believed in "giving full consideration to environmental factors" in highway development:

> But we are concerned, however, with the increment of unnecessary delay and unreasonable cost imposed upon the taxpayer resulting from the obstructionist tactics of some groups. These people have overreacted to environment problems [sic] and have encouraged illogical restraints upon progress. [*1972 Highway Legislation*, p. 349]

Gene Johnson, president of The Asphalt Institute and chairman of ARBA's highway advisory council, presented the organization's eight statements of position. The group recommended continuing the Interstate program to completion as soon as practicable at an annual rate of $4 billion, with an additional $2 billion for the other Federal-aid systems. The 1970 Act provision requiring the States to submit a construction schedule for all remaining Interstates by July 1, 1973, and commitments to PS&E for those segments by July 1, 1975, should be amended to substitute "1978" for "1975." Although ARBA supported eliminating routes that could not meet a specified deadline, the original date was "unrealistic in view of the many procedural requirements which must be satisfied" prior to PS&E.

(At this point, the hearing transcript notes that former Representative Fallon entered the room and received a standing ovation. Chairman Kluczynski welcomed him and said, "We miss you tremendously, but wish you well in your leisure and retirement years." Representative Harsha also wished him well and added, "George, we miss you." The transcript notes that Fallon replied, "Thank you, Mr. Chairman. [Applause.]")

Continuing, Johnson said that ARBA believed that "Federal aid for highways has been overregulated to a point where the hands of State highway officials are tied unnecessarily." Instead of having to adjust State priorities to "fit the compartments" of Federal-aid, ARBA believed "that the State highway departments should have complete freedom to transfer Federal-aid funds from one category to another." This would be "a positive step in the direction of revenue sharing," while maintaining the "structure and integrity" of the Federal-aid highway program.

ARBA favored a 70-30 Federal-State matching share "to compensate for the costs of inflation, the additional cost of community impact features and higher construction standards."

Johnson explained why ARBA opposed impoundment of Federal-aid funds. "In our judgment, this represents a serious breach of trust with the highway users who are paying 'special' taxes with the understanding that these taxes will be used for specific purposes." Impoundment was "completely incompatible with a sound programming procedure at the State and local levels." He elaborated on this point:

> During the first three-quarters of the current fiscal year, three different sums of money have been allotted under three different sets of rules. The procedures for the fourth quarter, which begins April 1, have not yet been revealed. It would be difficult to devise a more confusing system.

ARBA endorsed the highway-oriented public transportation funding authorized by the 1970 Act, while advocating a separate trust fund for urban mass transportation:

> As members of this committee know, the Highway Trust Fund was established to meet certain well-defined highway needs. It was determined many years ago that these needs could not be adequately met by the financing available from the general funds of the Treasury.

> We supported the principle, at that time, that special taxes should be levied on the direct beneficiaries of the program being proposed.
>
> We still believe that this is the soundest method of financing transportation development projects. [*1972 Highway Legislation*, p. 356-360]

In response to a question from Representative Harsha, Johnson clarified that while ARBA supported the use of Highway Trust Fund revenues for highway-oriented transit facilities, it did not support the use of the revenues for rail rolling stock. When Harsha asked how to finance a trust fund for mass transit, Johnson suggested that the metropolitan areas in need of rail transit could tax their citizens as a fair way to accomplish it. He did not offer a suggestion regarding financing of a Federal trust fund for transit. [*1972 Highway Legislation*, p. 367-368]

Johnson gave way to Robert Hajzyk, president of ARBA's County Division, as well as director of public works for Cecil County, Maryland. He explained that the Federal-aid highway program was "overburdened with 'red tape.'" Red tape, he said, is an "established fact" that he did not need to discuss in detail. "Nobody wants it and nobody likes it." Some is necessary as a matter of accountability, but carried to an extreme, it is burdensome.

As a result, ARBA called for extension of the simplified Federal-aid procedures under the Secondary Road Plan for all Federal-aid systems except the Interstate System. The Federal-Aid Highway Act of 1954 had authorized the Secretary of Commerce (whose Department included BPR) to enter into agreements with any State for Federal-aid secondary projects to "discharge his responsibility relative to the plans, specifications, estimates, surveys, contract awards, design, inspection, and construction of such secondary road projects by his receiving and approving a certified statement by the State highway department setting forth that the plans, design, and construction for such projects are in accord with the standards and procedures of such State applicable to projects in this category approved by him." The Secondary Road Plan had subsequently been codified as Section 117 of Title 23, United States Code.

Hajzyk said that the Secondary Road Plan had been justified because many Federal-aid secondary road projects were relatively small. Now, with the State highway agencies suitably equipped and organized, extension of the concept to all non-Interstate projects, while not a complete solution to the problem of red tape, was a "step in the right direction" because it would eliminate Federal supervision on a project-by-project basis, which he called "costly, unnecessary and wasteful."

ARBA recommended that up to 20 percent of non-Interstate Federal-aid funds should be available for critical safety needs off the Federal-aid systems. For example, two-thirds of the 88,900 critically deficient bridges and 165,000 rail-highway grade crossings were on non-Federal-aid roads, as were many high hazard locations:

> Without financial assistance on the non-Federal system, much needed improvements will be needlessly delayed and in all probability never completed. As a result, the reoccurring slaughter on the highways will continue at a never ending pace.

He concluded his prepared statement by pointing out that the county roads engineers are "at the end of the Federal-aid chain." He knew where work needs to be done, how to do it, and how to prevent accidents. "It is a sad commentary, indeed, when urgently needed projects are not accomplished because of the difficulties in getting paperwork and other approvals done from the Federal Government." [*1972 Highway Legislation*, p. 360-363]

The final ARBA witness was J. L. Cone, Jr., vice president of the Contractors Division and president of the Florida-based Cone Brothers Contracting Company. His topic was "the ever-increasing federalization of the Federal-aid highway program which is resulting in inflationary pressures on construction costs, discrimination against smaller contracting firms, and a general slowdown or actual stoppage of construction." The adversities facing contractors, he said, "largely result from inordinate delays and stop and go procedures associated with excessive bureaucratic controls and sporadic funding." He favored less red tape and more delegation of authority to the State highway agencies.

The increase in safety and environmental requirements was creating "tremendous inflation in the cost of highway construction and discrimination which could result in the elimination of some small, but good, contracting firms." He cited a requirement of the Occupational Safety and Health Administration calling for expensive rollover protective devices for retrofitting construction machinery as an example of excessive safety regulations. Appeals to the Department of Labor "have gone unheeded" and so ARBA turned to the committee "with the hope that through the legislative process some relief might be obtained."

The industry can "point with pride" to its environmental initiatives, but was "now confronted with a situation which not only involves harassment of contractors, but places substantial increased costs upon the taxpayer." He was referring "to the increasing number of frivolous suits brought by irresponsible environmental advocates." Some suits were justified, but "far too many suits are being entertained without justification." They were causing delays, sometimes substantial delays of "such duration as to cause severe economic loss." He urged the subcommittee to adopt procedures that would shorten the decisionmaking process for environmental requirements. He added that those seeking injunctive relief should be required to post a bond that would be forfeited when their claims were dismissed as being without cause. [*1972 Highway Legislation*, p. 364-366]

Members of the subcommittee had a few questions on details, but ARBA's testimony ended after about a 2-hour session.

Secretary Volpe was scheduled to testify on March 16. In anticipation of his testimony, the *Washington Evening Star* published an article by Helen Leavitt, author of *Superhighway-Superhoax* and co-publisher of the *Rational Transportation* newsletter. It began with a reference to President Nixon's groundbreaking trip to the People's Republic of China, February 21-28, 1972, where he met with Premier Chou En-lai (now spelled Zhou Enlai):

> If Chou En-lai ever visits the United States, surely the President, now that he has seen the Great Wall, will want to show the Chinese leader the greatest public works project in the world, our national highway system—from a helicopter, of course, to avoid the congestion.

> He will want to explain that a mere 17 years ago and $217 billion dollars ago we were told a massive highway program would solve [sic] our traffic problem by 1972. We now have another 18 years and $600 billion more to go. At least that's what the experts are estimating now, the same experts who predicted in 1956 that the cost of the Interstate Highway System alone would be $27 billion.

These same experts, she said, "will be swarming to Capitol Hill all this month and next" to protect the Highway Trust Fund.

Since 1956, the Federal program had spent $53 billion in Highway Trust Fund revenue, while spending $29 billion in general revenue on all other forms of transportation. "As the billions flow into the Trust Fund, Secretary of Transportation John Volpe parcels out millions from separate funds for want [sic] his Urban Mass Transportation Administration calls 'mass transit.'" Much of the transit funding is used "to prop up sagging bus companies in cities where heavy emphasis on superhighways . . . has deprived local bus companies of passengers in sufficient number to make it hard for them to meet the payroll, let alone make a profit."

The dedication of highway user tax revenue to highway construction meant that the Highway Trust Fund would provide $5.7 billion for that purpose in 1972 – at a time when total Federal expenditures for education totaled $4.46 billion and former Vice President and presidential hopeful Hubert H. Humphrey was stating that massive financial aid was needed to provide quality education to all children.

She summarized the long-running decline of urban mass transportation and the failure of highways to deliver on the promises made by their supporters. "As you might have guessed by now, more than a few people have become disenchanted with highway building." She mentioned Mayor Daley's recent testimony, the support of Representatives Koch and Bingham for the use of Highway Trust Fund revenues for public transit, and Senator Kennedy's legislation to create a Transportation Trust Fund. "Naturally, it is officials from our most densely populated areas who seem most interested in ending the preferential treatment that has been accorded highways for the past 16 years."

On the other side were the many interests that preferred the status quo, including highway engineers, automobile manufacturers, and the petroleum industry. "Rubber tire manufacturers, auto insurers, car dealers, gasoline station operators, parking lot operators, and the trucking industry, which has doubled since 1956, all depend on highway programs to further their interests." She did not expect Secretary Volpe, testifying on behalf of the Nixon Administration just 8 months before the presidential election, or Chairman Mills of the House Ways and Means Committee to antagonize these groups.

She referred to a statement by Administrator Turner that he would submit proposals that she described as: "reduce the number of passenger cars coming into our downtown areas and replace them with either better bus or subway systems." He had made the statement on February 14, 1972, during a hearing on "Wider Buses and the Interstate Highway System" before the Senate Subcommittee on Roads. The House had passed legislation on July 21, 1971, to allow buses 102 inches wide to operate on the Interstate System (compared with 96 inches at the time). While Turner was before the panel on wider buses, Chairman Birch Bayh (D-In.) asked about proposals to substitute buses for automobile in cities. Turner replied that "there is no subject in the highway field at least that is getting any more attention than the one you are talking about." The following exchange took place:

> Senator Bayh. It involves pressures relative to other, more-comprehensive legislation upon which I am sure you will be here to testify later.
> Mr. Turner. I am aware of the circumstances that you describe and I assure you that there are not a few experiments but many, many, and a great deal of effort being effected in the direction you just described. Now, we will bring to you in hearings later this year, this session, some proposals to further the objective that you describe, which is ours too, to reduce the number of passenger cars crowding into our congested downtown urban areas, and replace those with mass transit type vehicles. In the Washington, D.C. case and hopefully in other metropolitan areas we would like to accomplish the same thing. Also, we are considering proposals that will make better utilization of vehicles by increasing the number of occupants of those vehicles, which is aimed in the direction you described. You will be hearing more of this from not only Department witnesses but others in the next few months.
> Senator Bayh. I am anxious to get those ideas and those statistics. It seems to me that reasonable development and use of a workable mass transit system is indispensible to our well-being . . . . One reason there has not been sufficient private investment and Federal resources is that so much of our mass transit program, at least from a public standpoint, has been directed at only a few localities. There has been little publicity or activity about what could be done to help people get back and forth to work and other pursuits in the average hometown throughout the country. Any system that doesn't do that, we are not going to be able to sell.
> Mr. Turner. I have been preaching that gospel rather loudly at every opportunity.
> Senator Bayh. Permit me to say amen.

At that point, Turner had to leave the hearing because he was due at a ceremony in 13 minutes to dedicate 20 new buses for the Shirley Highway exclusive bus lane.

(As the lead Department witness during Turner's testimony, Assistant Secretary Benjamin O. Davis, Jr., advised the subcommittee that the Administration opposed the measure and recommended that the subcommittee postpone action until current studies on the safety of wider buses were completed. According to an article about the hearing, "Subcommittee sources said wider buses could be seen 'as a foot in the door' for truckers to seek increases in the size limits on their vehicles. Therefore, these sources said action was unlikely this year." Congress did not adopt the wider bus legislation under consideration. [Steif, William, "Fat-Bus Bill Skids," Scripps-Howard, *Washington News*, February 18, 1972])

Leavitt was skeptical about what Turner would present. She was sure that he did not mean freeing Highway Trust Fund revenues, but allowing transit funds for what she described as "exclusive bus lanes, car pools, and anything else that will get people to double up in their autos—while simultaneously building more highways."

She concluded by summarizing her views:

> The great lesson we have learned from the Highway Trust Fund is that planning follows funding rather than vice-versa. All those federal dollars, soon to total $6 billion annually, should be returned to the general treasury, where they would now be if the Congress had used its collective head in 1956. By removing this federal incentive to channel billions of state and local matching dollars into highway building, we can free our tax dollars for other programs like getting our kids educated. We already have all the highways we need to bus them to school. [Leavitt, Helen, "The Move to Shake Loose Some of that Road Money," *Washington Evening Star*, March 5, 1972; Bayh/Turner colloquy: *Wider Buses and the Interstate Highway System*, Hearings Before the Subcommittee on Roads, Committee on Public Works, United States Senate, 92nd Congress, 1st and 2nd Sessions, Serial No. 92-H29, p. 286-287]

Turner would explain his ideas for congestion relief in an article appearing in the May 1972 issue of *Traffic Safety*. Of course, bus mass transit was at the top of his list. "We have learned that bus mass transit can be both truly rapid and successful." He cited the express bus lanes on Shirley Highway as an example that "can be duplicated in practically any large urban area in the country."

A few other things could help relieve congestion. One was staggered work hours, a practice employed by the Agencies housed in the Department of Transportation headquarters. He cited his own commute as an illustration. When he moved to Washington in the 1950s, he lived in Virginia, a little over 3 miles away from his office, then in northwest Washington, and his commute by bus took an hour. Now, he lived 7 miles away in Virginia, but his commute by bus to southwest Washington had been cut to about 35 minutes. "So three decades later, I can commute twice as far in half the time, as can four times as many new commuters as 30 years ago." He attributed this progress partly to staggered work hours.

Another technique involved staggered work days instead of the traditional Monday-through-Friday work week. Shifting some workers to Saturday might be necessary, while a 4-day week for workers, also staggered, "can reduce peak central business district travel by 17 percent, with a still further reduction if spread over six days instead of five.

He also endorsed car pools. He cited the example of a Federal building in downtown Washington where cars using the garage space had an occupancy rate of 3.6. "If this condition were universal, there would be no problem of congestion because of the 50 percent reduction in the number of autos in use." Allowing carpools in exclusive bus lanes could add to the attractiveness of carpooling.

In speaking of transit, he was referring to radial lines linking the suburbs and central business districts, as used by workers on their daily commutes. These lines were beneficial for commuters, but severely limited in helping "the aged, the poor, the infirm, and the young" who are often cited by pro-transit organizations:

> Transit systems are often suggested as the means of providing for their needs—but studies of the actual transportation requirements of such persons indicate that transit as we presently think of it generally is poorly suited to their needs.

The problems for these individuals included getting to and from the transit service without an automobile. "Even when they get there, their difficulties are not over." They had to wait at the transit stop, often have to stand while on the bus, and may have to repeat the process for transfers, all of which "are real problems for the elderly and the handicapped." Their needs–"to shop where prices are competitive, to get to health, welfare, and educational services, to visit friends and relations, and to go to work places that frequently are outside the central business district"—are not well served by radial transit lines on a fixed schedule. Public policies that would serve these individuals "would seem to be in the public interest as a part of the public transportation network of a city."

Highway travel in private automobiles "can provide the flexibility to accommodate the almost infinite number of travel patterns that are required in our metropolitan areas today." No transit system, bus or rail, "could possibly begin to supply the multitude of complex routings that are required to meet these needs." He concluded:

> Our transportation needs are very real and very urgent—and nothing short of coordinated action will do the job. We must have adequate mass transit systems for our cities, but let no one delude himself that we can afford to neglect or abandon our highway system. [Turner, Francis C., "What We Can Do NOW to Cut Urban Rush-House Congestion," *Traffic Safety*, May 1972, p. 4-5]

The Single Urban Fund

In late January 1972, the Department of Transportation submitted the new Interstate Cost Estimate to Congress. It estimated that the total cost of the 42,500-mile Interstate System would be $76.3 billion (Federal share: $68.2 billion). This estimate included expenditures incurred in opening 76 percent of the Interstate System (32,988 miles) and completing stages of work on the remaining mileage, as well as remaining costs to complete the Interstate System to full standards.

The new estimate was $6.4 billion over the 1970 estimate, as explained in a news release dated January 29, 1972:

> The report attributes the increase to several factors. Inflation accounts for $3,825 million of the increase. New legislation and policies which give increased emphasis to social, economic and environmental impact considerations, increased relocation assistance payments and additional assistance to mass transit account for $730 million of the additional cost.

> Additional construction items to improve traffic safety and service such as upgraded roadway design and safety features, added interchanges, grade separations and lanes, add $1,300 million to the total, while higher preliminary engineering and right-of-way costs add $285 million.
>
> At the same time, adjustments in the system resulted in a net reduction of $235 million, so that the overall increase due to the foregoing factors is $5,905 million.

According to a quarterly status report issued on March 6, 1972, the States opened 1,445 miles of Interstate freeways in 1971. Only 4 percent of the designated mileage had not progressed beyond preliminary engineering:

> Of the Interstate mileage now in use, 27,903 miles are completely adequate for future traffic demands, and 2,780 miles, while fully capable of handling present needs, will have to be improved to meet ultimate standards. The additional 2,305 miles that are in operation are toll roads, bridges and tunnels which were incorporated into the System as provided by law . . . .
>
> In addition to the sections open to traffic, 3,862 miles were under construction as of December 31, and engineering or right-of-way acquisition was in progress on another 4,098 miles. Thus, some form of work was underway or completed on 40,948 miles of the 42,500-mile System – about 96 percent of the total . . . .
>
> Work completed since July 1, 1956, has cost $34.18 billion, of which $28.32 billion was for construction and $5.86 billion for engineering and right-of-way acquisition. As of December 31, 1971, work estimated to cost $13.01 billion was underway or authorized, including $9.02 billion of construction, and $3.99 billion of engineering and right-of-way acquisition.

That same month, Federal Highway Administrator Turner and Urban Mass Transportation Administrator Villareal were the keynote speakers at the 51st annual meeting of the Highway Research Board, held in Washington in the Sheraton-Park Hotel on January 17-21. They spoke during the annual chairman's luncheon. The theme of the luncheon was "Urban Transportation in the '70s."

Turner said that each urban area must find its own carefully balanced prescription for relieving congestion. Spending equally on highways and transit was not necessarily the answer:

> Ready made prepackaged, home-cure, self treatments for complex urban transportation ills are no more likely to cure the urban transportation problem for us than such methods can be accepted as good medical practice.

Each urban area must decide on the combination of transportation operations that could best provide needed service for the elderly, handicapped, poor, and younger members of society; weigh the views of environmental organizations; apply the always insufficient funding to buy the largest amount of needed service; and provide the best mix of transportation options for service all day in all regions, not just for rush hour.

Villareal, like Turner a Texas native and graduate of Texas A&M University, had been appointed to the U.S. Naval Academy in 1948. After 4 years in the Navy, he worked for General Electric in Cincinnati and for Marquardt, a California aerospace research firm, before his appointment as Administrator. In announcing the selection of Villareal for UMTA Administrator, Secretary Volpe had explained, "He's not a transit man, and that was deliberate. I wanted someone who wasn't wedded to old concepts but who could think fresh and was familiar with technological research." [Kilgore, p. 186]

The UMTA Administrator told the luncheon guests:

> I am not here to suggest that national and local highway programs must be overturned in favor of public transit construction programs, although there are those who infer that highway and public transit programs cannot co-exist. Not only can they exist together, but a partnership of modes is absolutely essential if we are to provide the transportation capacity we need and attain the environmental objectives we all consider important. ["Highway-Mass Transit Programs Must Co-Exist for Effective Urban Transport," *Traffic World*, January 23, 1972]

The sacrosanct Highway Trust Fund would face challenges from friend and foe, starting with the New Technology Task Force, a presidential advisory team headed by William M. Magruder, special technology counsel to President Nixon. The task force had conducted a 4-month review of technologies for relieving urban congestion and pollution caused primarily by automobiles. In interviews in early February, Magruder revealed that Department of Transportation lawyers had informed him that using Highway Trust Fund revenue for non-highway purposes such as subway construction was "legitimate." Magruder told reporters, "We were told it would be legal to do it. The next thing is for us to screw up the courage and do it." Although the task force had run out of time before making a recommendation on the Highway Trust Fund, Magruder said that the members would continue seeking new uses for the revenue. "We're dedicated to a change of priorities." [Bernstein, Peter J., "Trust Fund Finding Bolsters Highway Foes," *Washington Evening Star*, February 9, 1972]

(Magruder, an engineer and test pilot, had headed the Administration's efforts to secure funding for the SST, first at the Department of Transportation before moving to the White House.)

That same month, an editorial in *Better Road*s warned that the "highway profession sometimes seems to be its own worst enemy in the running battle to keep the Highway Trust Fund from being raided for 'worthy' causes such as education, welfare, and mass transportation programs." The specific concern was the proposal to add revenue from excise taxes on liquor sales to the Highway Trust Fund. With "mass transit lobbyists battering at the trust fund gates," the addition of revenue from nonhighway taxes would leave the Highway Trust Fund "open to the charge that it is not a unique tax haven and in reality is general fund money susceptible to diversion as any other tax income." The editorial warned supporters:

> Certainly with the Interstate system well behind original and even revised schedules, this is no time to weaken the presently hard-pressed defenses of the trust fund. Let's keep a tight rein on the highway-user/highway-use concept for the Highway Trust Fund. Otherwise we may end up without the fund and still be faced with the need for more, better, and safer highways.
>
> The future of the Highway Trust Fund is precarious enough without giving its opponents free ammunition! ["Let's Not Weaken the Highway Trust Fund," *Better Roads*, February 1972, p. 6]

As noted earlier, the proposal by Senator Randolph to add tax revenue from liquor sales to the Highway Trust Fund ultimately failed.

The Administration launched the next assault on the Highway Trust Fund in the form of part 1 of *The 1972 National Highway Needs Report*, sent to Congress on March 15, 1972, in response to Section 121 of the Federal-Aid Highway Act of 1970. The section, titled "Future Federal-Aid Highway Program," directed the Secretary to include his recommendations for a continuing Federal-aid highway program for the period 1976 to 1990.

The report recommended "fundamental changes" to the Federal programs for highways and urban mass transportation by establishment of a Single Urban Fund for these purposes:

> This fund would consolidate all existing urban highway and mass transit programs with the exception of the Interstate highway program and the Urban Mass Transportation Research and Development, and Demonstration Program. Similarly, all rural highway programs would be consolidated into a Rural Federal-Aid System and a Rural General Transportation Fund. The existing Interstate highway program would be continued as a separate category to insure completion of that system.

The purpose of these changes was to:

1. Provide increased resources to deal with the problems of transportation in our major metropolitan areas;
2. Provide increased flexibility to State and local governments to decide their transportation priorities by abolishing narrow categorical grant programs; and,
3. Provide an assured pattern of program growth by funding both highway and mass transit projects from the highway trust fund.

[Summary of Recommendations, *The 1972 National Highway Needs Report*, Part 1, Communication from the Secretary of Transportation, 92nd Congress, 2d Session, House Document No. 92-266, p. vii]

The report also discussed accumulated highway needs at present and through 1990:

> The construction needs were estimated for all roads and streets over the 1970-90 period, including the cost of completing the Interstate System. Nearly $302 billion is for arterials, including completion of the Interstate System, $107 billion is for collectors, and the remaining $183 billion is for local systems. About 43 percent of the total needs are on the Federal-aid systems as they existed in 1970.
>
> The backlog needs are a significant proportion of the total needs for all systems. For arterials, the backlog represents about 68 percent of the total in rural areas and 50 percent in urbanized areas. For collectors, 85 percent of the needs are backlog in rural areas and 62 percent in urbanized areas. Backlog is a greater proportion of the total for lower functional classes. [*Needs Report*, p. 11]

The Single Urban Fund grew out of the "widely acknowledged" fact "that among the most urgent of our transportation problems are those confronted by our urban citizens as they travel about the metropolitan areas where they live; for work, for business, for services, for shopping and for pleasure." Adding to the unpleasantness were "congestion, air pollution, and sub-optimal land use patterns." The report continued:

> As great as the magnitude of its severity, however, is its complexity and the great variance in its nature and in the desirability of various solutions among different metropolitan areas. Not only do conditions vary, but so do local values and priorities. From the national viewpoint, using gross aggregate estimates, it is virtually impossible to plan a program that will meet the needs of each metropolitan area. The only viable solution lies in expanding the flexibility of State and local officials to determine how these funds are to be used in metropolitan areas. However, it is also important that the States retain an active role in dealing with urban transportation problems.
>
> Accordingly, the Single Urban Fund has been developed to encompass all of the Department's urban transportation grant authority, both highway and transit, in a single program financed out of the Highway Trust Fund and focused on intra-urban transportation in metropolitan areas. Grants from the Single Urban Fund could be used by State or local officials for investments in facilities (including land acquisition) or rolling stock, regardless of mode, for surface transportation in metropolitan areas. Thus, officials close to the real problems could find the best ways to move people in our urban areas.

The fund would become effective with a $1 billion authorization as part of the FY 1974 highway program. In FY 1975, when the mass transit authorization will have expired, the Single Urban Fund would be increased to $1.850 billion. FHWA and UMTA would continue to administer their usual activities. [*Highway Needs*, p. 22-23]

(According to Elizabeth Parker:

> Secretary Volpe's initial proposal for a Single Urban Fund provided flexibility in the use of highway funds for highway and transit investments, but did not incorporate the UMTA program. The Office of Management and Budget (OMB), however, required that DOT

propose merging the UMTA capital grant program with the Urban System fund. [Parker, p. 56-57])

With the Interstate System perceived as nearing completion in 1979, annual authorization levels for Interstate construction ($4 billion for FY 1976) could be reduced due to "the normal tapering down of the program." A moderate reduction in funding "would enable an orderly completion of the Interstate System and a smooth transition in a post-Interstate program." The report cited the mandate in the 1970 Act requiring removal from designation of an Interstate segment if the State had not submitted a schedule for completion by July 1, 1973 or plans, specifications, and estimates by July 1, 1975:

> [D]elays in remaining uncompleted segments have resulted in some cases, particularly in urban areas, of substantial local controversy over the proposed segments. The time constraints imposed by the 1970 Act are sufficiently strict so that it will become increasingly difficult to thoroughly restudy the remaining uncompleted segments, accomplish major design modifications to the segments to ameliorate their social and environmental impacts, or look at alternatives to the segment. Pressure is building for a locality to accept a presently planned segment which may not be totally acceptable to its needs, or lose all Federal funds which would otherwise come into the area. This is a difficult situation for such areas.

With calls to modify the deadlines imposed by the 1970 Act, the report offered several recommendations:

> Reduce Interstate authorizations to $3.25 billion for fiscal years 1974 and 1975, and to $3.0 billion for fiscal years 1976 – 1979.
>
> Retain the general provision of the 1970 Act mandating removal of Interstate segments from the system for which a schedule for completion has not been submitted by July 1, 1973, but modify it as follows:
>
>> Remove the July 1, 1975, date limitation for plans, specifications and estimates (PS&E).
>>
>> Require States to notify the Secretary of Transportation if the State intends to build the particular segments.
>>
>> Authorize the Secretary of Transportation to allow the State one full year to submit a schedule and completion date on an alternative segment of Interstate Highway within existing limits. [*Highway Needs*, 40-42]

The report gave less attention to rural needs, but did acknowledge "critical surface transportation requirements in our rural areas, in modes other than highways or on highways off the Federal-aid system." [*Highway Needs*, p. 42]

It recommended two rural programs:

The Rural Federal-Aid System

Funds would be available for capital investments on a newly designated Rural Federal-Aid System. The new rural system will primarily consist of arterials and major collectors in rural areas and will equal approximately 20% of total rural road mileage.

The system would be further divided into a "select" portion consisting of arterials and a "supplemental" portion consisting of major collectors. At least 60% but not more than 90% of the funds must be spent on the "select" portion of the system in each State.

The Rural Federal-Aid System would have to be established effective July 1, 1973, and the funds would be apportioned to States with mileage on the new system in accordance with the following formula:

1/3 based upon State population.
1/3 based upon the square root of State land area.
1/3 based upon system mileage.

Rural General Transportation Fund

This new program would go into effect July 1, 1973, and funds would be apportioned to the States in proportion to their population outside of metropolitan areas (SMSA's [Standard Metropolitan Statistical Areas]). These funds could be used for any capital investments relating to surface transportation and would be available for highway investments not on the Rural Federal-Aid System. [*Highway Needs*, p. x-xi]

(Secretary Volpe transmitted part 2 of the 1972 National Highway Needs Report to Congress on May 30, 1972. It concerned the designation and cost of the new Federal-aid urban system.)

The Single Urban Fund was the boldest proposal for restructuring surface transportation programs since President Dwight D. Eisenhower had proposed his Grand Plan in July 1954. Just as President Eisenhower's proposal was met with mixed reaction, so would Secretary Volpe's proposal. (See "Ike's Grand Plan" at http://www.fhwa.dot.gov/infrastructure/50grandplan.cfm and "Address of Vice President Richard Nixon to the Governors Conference" at http://www.fhwa.dot.gov/infrastructure/rw96m.cfm.)

At a press conference on March 14, Secretary Volpe said that President Nixon was actively backing the proposal, which replaced earlier proposals for a single trust fund and Special Revenue Sharing for Transportation. He acknowledged, however, that the Single Urban Fund would probably encounter stiff resistance from the trade groups representing the modes. "It is a bold move, but I am ready to stand up and argue the case with anyone, whether he is a trucker or a highway contractor." He considered the likely opposition "scattered" rather than "concentrated":

> There are considerable differences between us and some of the industry, but we all recognize that we aren't solving the problems now. We aren't eliminating the trust fund, only giving it the flexibility that it needs. We can't solve the problems alone without coordination.

An article about the press conference summarized Secretary Volpe's comments on coordination:

> Sec. Volpe said state and local areas would be encouraged to develop regional bodies to plan for transportation projects, and these groups would be depended upon to make the decisions of need for an area. However, he said their role would be somewhat advisory, and would not amount to another layer of government.
>
> The regional bodies would have the right to use all the funds for highway projects if they so choose, Sec. Volpe said, or to select another mode which needed funding.

All depended on congressional reaction:

> Sec. Volpe said the proposal would have to go before at least six congressional committees. If funding for airline equipment for commuter operations was included, it would mean four more committees would have to be consulted, the DOT official said. "We don't want to go before any more committees than necessary," he said. "Congress wouldn't consider it this year," he explained. [Martin, William A., "Volpe Calls for Bustup of Highway Trust Fund," *The Journal of Commerce*, March 15, 1972]

Reporters canvassed the transportation interests for immediate reaction. Kramer of the Highway Action Coalition called the proposal a "bold and progressive move which we support wholeheartedly." His only reservations were completion of the Interstate System and the need to extend the operating subsidies for bus and commuter rail lines. Senator Kennedy also praised the plan as "a bold step in this effort to produce a balanced transportation system," but urged its expansion to offset operation losses.

Senator Williams was concerned that local officials might subordinate transit needs in favor of the much larger highway program (a concern Secretary Volpe denied during his press conference). The National League of Cities and the U.S. Conference of Mayors praised the Volpe plan, but questioned whether the Highway Trust Fund was large enough for highways and transit. [Eisen, Jack, "Volpe Urges Use of Road Fund for Improving Mass Transport," *The Washington Post*, March 15, 1972; Barnes, Fred, "Bid to Divert Highway Fund Faces Fight," *The Baltimore Sun*, March 15, 1972; and "Kennedy Asks Modification of Volpe Transit-Aid Plan," *Washington Evening Star*, March 17, 1972]

An editorial in *The Journal of Commerce* recalled the story of the Sorcerer's Apprentice in calling Volpe "the Senior Sorcerer." Calling the proposal "very modest in scope" but "eminently sound," the editorial said, "Mr. Volpe has been secretary of transportation long enough to know the hornets in the nest he now wants to perforate. We wish him well, but fear he is in for a painful stinging." Regarding the Senior Sorcerer's description of the plan as "bold," the editorial agreed, "It is bold in the sense that it is bound to detonate a monumental clash with interests dedicated exclusively to more and better highways . . . ." ["Return of the Sorcerer," *The Journal of Commerce*, March 17, 1972]

An editorial in *The New York Times* declared that Secretary Volpe's recommendation "that politically sacrosanct highway trust funds be spent for mass transit projects is refreshing." The editorial identified some objections:

> In light of the country's vast overindulgence of its highway builders, the Secretary's proposal falls short of the drastic shift that is required.

Highways would continue to receive "a disproportionate share of the funds" through the end of the decade. "And, finally, the full sum for mass transit would go to capital outlay; none for operating costs, which in city after city have sent fares skyrocketing."

The editorial board's objections "are modest compared with the opposition to be expected from those who have up to now fought the slightest effort to use highway trust funds for anything but building more highways—even for safety research." It quoted Chairman Kluczynski as calling the recommendation "a complete departure from the existing Federal aid-to-highways program" and said that most of his colleagues felt the same way. The editorial continued:

> Of course it is a departure and that is precisely what is good about it. Mr. Volpe deserves credit and support for rejecting the sacred canon that concrete is the answer to all of America's transportation problems. ["Highway Trust-Buster," *The New York Times*, March 18, 1972]

A *Baltimore Sun* editorial said, "It is about time." For years, everyone agreed that metropolitan areas needed a "balanced" transportation system, but little agreement on how to pay for it. "Mass transit advocates have looked longingly at the Highway Trust Fund . . . [but] highway builders have defended the fund, arguing it should be for the exclusive use of highway users." The logic of that argument "is no longer valid." Those who contribute to the Highway Trust Fund would benefit by having buses available to reduce costs of congestion, while those who stay in their cars would find "less highway and street auto congestion." After all, "The Highway Trust Fund is not all that traditional." It dated only to the 1950s, before which gas tax revenue went into the general Treasury:

> Mr. Volpe is no enemy of cars or highways . . . . But he recognizes the pressing need for accelerated mass transit activity, and he recognizes that if there is to be a trust fund in this area it should not be a narrow one but one aiding all transportation, which is the approach this state already is taking. ["A Trust Fund for Transit," *The Baltimore Sun*, March 20, 1972]

As some of these comments suggest, transit interests questioned the Single Urban Fund as a solution to their concerns, which grew in coming days. One troubling issue was the fact that the proposal would replace separate funding for urban transit by placing $1 billion of Highway Trust

Fund revenues in the Single Urban Fund. *Forbes* magazine explained the transit interests' concerns:

> The Single Urban Fund money would go to the cities and states for all forms of transportation—highways and subways. The subway people would be indeed fortunate to get their hands on half of it. Even then the Volpe plan would disburse the money broadly to communities on the basis of population. While this sounds reasonable in theory, in practice it would prevent the kind of concentrated funding allowed presently under UMTA. [The] Volpe plan would give less money to almost every major metropolitan area that is engaged either in building, modernizing or planning a rapid rail transit system. In short, the Volpe plan would give too little money to make the choice between rapid rail and highway transit any but a make-believe choice.

Mayor Sam Massell of Atlanta, Georgia, said, "This limited amount of funds would not allow the urgent and pressing needs of Atlanta and similar cities to be fulfilled."

Putting the dispute in perspective, *Forbes* said:

> Before 1970, funds for urban transit ran at a token level while the highways spun out across the landscape. New Jersey's Senator Harrison Williams was a voice crying in the wilderness for mass transit. He remembers when urban transit got $60 million from the Congress in 1965, a year when highways received $4 billion.

The $10-billion, 10-year commitment to urban mass transportation approved in 1970 was faltering, and the new proposal would not help:

> Williams feels that Volpe's plan would make urban transit, specifically rail transit, a permanently poor second cousin. It would also, in the niceties of Washington maneuvering, remove Williams' Senate Banking, Housing & Urban Affairs Committee from consideration of funds for transit.

Under Secretary Beggs responded to such concerns by saying, "Our program provides a continuous source of financing for transit. Opening up the trust fund relates to long-term financing. We're addressing a continuous source of financing." His frustration was clear when he added, "Look, we've been told for years this is the thing to do, open up that trust fund. Now we're doing it and they say it's not enough." Although some cities, such as Atlanta, San Francisco, and Washington, were committed to new rail systems, Beggs said, "The only places subways are needed are in the big cities on the coasts. Between the Appalachians and the Rockies there are cities that are well served by their highway transport." ["Gift Horse," *Forbes*, April 15, 1972]

Taking the Case to the Hill

On March 16, Secretary Volpe appeared before the House Subcommittee on Roads accompanied by UMTA Administrator Villarreal, Deputy Federal Highway Administrator Ralph Bartlesmeyer, and other Department officials. (Turner could not appear; he was testifying before the Appropriations

Committee.) "We are happy," Secretary Volpe said, "to testify concerning the 1972 National Highway Needs Report."

He was proud of the Interstate System. "I might just add that though we have had detractors, those who have cast aspersions upon this program, I for one am satisfied that it was an investment that was extremely worthwhile." With the Interstate System well on its way to completion, "the need for strong Federal control has decreased." He continued:

> Now is the time for those nearest the problem to take the initiative in meeting their transportation needs. Now is the time to break away from the established pattern of separate highway and mass transit programs. [*1972 Highway Legislation*, p. 486]

The Single Urban Fund was designed to "achieve our goal of flexibility for the future" because State and local governments "must have the responsibility of setting the priorities for the use of Federal funds for transportation projects." [*1972 Highway Legislation*, p. 486]

He also described the proposal for a Rural General Transportation Fund:

> In order to insure that the States will have sufficient flexibility to satisfy transportation requirements in rural areas, we propose a new program that would make moneys available for any surface transportation investment outside of our urban centers. Such a program would provide funds for capital investments in intercity rail services, rural bus systems, and highway projects not on the new rural Federal-aid systems.

The Single Urban Fund and the Rural General Transportation Fund would, he said, have several features in common. The Federal share for projects under both programs would not exceed 70 percent. No State would receive less than one-third of 1 percent of the total funds apportioned to the States. All procedural requirements would continue to be applicable, including those relating to civil rights, public hearings, environmental considerations, and engineering standards. [*1972 Highway Legislation*, p. 490]

American industry and auto interests were coming around to recognizing that this step must be taken. Truckers, for example, realized that they could travel at posted speeds on Interstates in his home State of Massachusetts, but when "they get within approximately 10 miles of Boston . . . it takes them an hour or more to go that additional small distance because of the congestion." He said, "This is why industry is starting to realize that action is necessary now":

> Our proposals will do no violence to the Highway Trust fund. As a matter of fact, it will enable us to see that true benefits accrue to the traveler, be he a trucker, a pleasure driver, a commuter, or a bus or rail commuter. [*1972 Highway Legislation*, p. 491]

He indicated that the Administration would send transit legislation to Congress soon to implement the proposals he had outlined, adding:

> Mr. Chairman, members of the committee, I realize that what we are presenting to you today is a major departure from past programs. It is, however, a departure from the past which is essential if we are to meet the demands of the present and the challenges of the future. The American people realize that this step must be taken . . . . The enactment this year of legislation implementing the 1972 Highway Needs Report will, I believe, be as visionary and as important to the American people as that 1956 legislation. [*1972 Highway Legislation*, p. 490-491]

During the question period, Representative Harsha said that in view of the discussion of the balance in the Highway Trust Fund, he wanted to know the Secretary's view on whether the Administration would continue to impound funds. Volpe replied that to the best of his knowledge, "the amount of the money which I have underlined as authorizations will be fully obligated."

Harsha asked, "What about the revenue sharing proposals that the administration sends up every so often?" Volpe replied:

> I am not saying that revenue sharing is dead, but I think we would be less than frank if you and I did not agree that, at least as far as we can see at the present time, there certainly does not appear to be any indication that the Congress will pass special revenue sharing, at this session of Congress.

In trying to understand how the new program would combine with existing programs, Harsha asked the Secretary to confirm that the mass transportation program would be financed entirely out of the Highway Trust Fund. Volpe confirmed his understanding. [*1972 Highway Legislation*, p. 497-503]

Representative Harsha submitted questions for the Secretary to answer for the record. In response, Volpe agreed that highway use would increase in future years. As for meeting those needs if the road building program is curtailed, Secretary Volpe said that resources will be limited in comparison to need in any case. "Given that such resource limitations are constraints that will be with us for some time, we have tried to look at the complete range of alternatives at our disposal, and not just more highway construction. In this way we hope to get the most from our transportation dollar."

Asked if the proposal "is a substitute for transportation revenue sharing," the Secretary replied that it was not. While he hoped Congress would approve Special Revenue Sharing for Transportation, his proposals were designed "to meet some of the pressing needs" of the present, especially in urban areas. If Congress also enacted Special Revenue Sharing, it "could quite easily be built upon the program we are advancing now."

Representative Harsha told the Secretary that the "anti-highway lobby" argued "that whenever we build highways, we attract cars to them like a magnet," thus creating instead of curing congestion. If the Single Urban Fund concentrates funds in urban areas, would that not by analogy also attract traffic and produce more congestion? The Secretary agreed that new highway capacity "frequently has the effect of generating additional automobile travel." He explained:

> However, the essence of our proposed new urban transportation program is that State and local officials are able to judge for themselves whether a highway investment in a particular area would have such consequences and can, instead, use the funds that would have gone for a highway project for investment in some other facility more likely to meet their needs effectively.

Representative Harsha stated that "the principal reason the Highway Trust Fund is being looked to as a means for financing mass transit facilities for cities is because the cities themselves cannot afford to construct them." Will they be able to pay for operation? Volpe pointed out that, "The financial status of any transit operation—i.e., whether it experiences a deficit or not—represents to a large degree the results of policy choices made by an operator or community concerning the level of service provided and the fares that are charged." Deciding against raising fares despite the current inflationary spiral of wages and operating costs, State and local governments have to subsidize services. He did not say whether he thought costs could ever be paid through the farebox.

In that case, Representative Harsha asked, did the proposal contemplate using Highway Trust Funds to maintain such systems? "Our proposal does not contemplate the use of Highway Trust Funds, or any other Federal monies, for maintenance or operation of transit systems." [*1972 Highway Legislation*, p. 504-506]

When Representative Schwengel's time for questions came, he noted that, "You will have to admit, Mr. Secretary, that the committee has been quite wise from time to time in not taking recommendations from the White House as they come down." He cited the example of the committee's rejection of President Eisenhower's proposal for funding the Interstate System by issuing bonds and dedicating gas tax revenue to retiring the debt. "One of the things we did that I am proud of—it was hard to do—was to create a trust fund and to provide a plan that paid as we go." The key element of the "trust" was "a commitment to the users." In view of that, "I want to put it real squarely and state to you, why does the user now, the automobile user, have the obligation to pay for the mass transit system?"

Secretary Volpe replied:

> Well, I will answer that in two parts, if I may, Congressman.
>
> First of all, long before the creation of the 1956 Federal Highway Act, there were user taxes that were not going into a trust fund. They were going into general revenues, and the Congress in its judgment appropriated on an annual basis such sums as they saw fit to appropriate to fund the highway program.
>
> The Congress very wisely, in my judgment, with the administration, worked out a plan that would provide for a trust fund into which those taxes that were already being collected would pour, plus some additional taxes that would be required to pay for the system that was envisioned.

> I personally do not believe we are in any way breaching our faith with the public insofar as the proposals we have made. As a matter of fact, those users have paid for a pretty expensive system, a doggone good system, the envy of the world.
>
> But the fact is that they are not able to utilize that system in and around the cities to the degree they ought to because of the congestion that is there. So if we are able to reduce that congestion, the reduction in the amount of gasoline that he uses will, I think, equal the amount of money that might be expended for mass transit.

Representative Schwengel said, "That sounds very good, Mr. Secretary," but offered as an alternative that every bus rider should pay an extra penny to finance mass transit. Volpe responded:

> I will give you my answer to that.
>
> Purely because 20 to 22 percent of the American people do not own an automobile. Most of those are the poor, the disadvantaged, the elderly, and the handicapped; and I as one American citizen feel we ought to try to do something to give them an opportunity to get to a health clinic, to get to a hospital, to get to a university, to get to all these other facilities that today they are unable to because they cannot afford it.

Schwengel agreed but asked, "when 90 percent of the people do not fit in that category, why should they [the transit-disadvantaged] not pay their share?" Volpe said:

> Congressman, if you keep increasing the fares, which has generally been the case, all you do is drive them away from the bus, and generally the bus routes do not go, in some cases, within five or six blocks of the homes in these ghetto areas.

Schwengel concluded his question time by saying:

> But what I am saying to you, is what I believe from the depth of my heart, that when you get those figures [on the impact of mass transit on Highway Trust Fund revenues] you are going to see how woefully inadequate this trust fund money is if you give it all to developing the mass transit system. That is the point I want to make . . . . As I said, if I can use any influence, I will on this, and I think this committee is determined also to support me on this. I may be wrong. I do not know. [*1972 Highway Legislation*, p. 522-526]

When the question period concluded, Secretary Volpe asked if he could make a concluding statement. Chairman Kluczynski agreed. Volpe said:

> I say to you very, very sincerely that it would have been very easy for me not to bite the bullet. It would have been much simpler for me to come before this committee, knowing generally what the feeling is, and just say well, let us repeat more or less the 1970 act, maybe add a little here, or subtract there, and so forth.

> But, frankly, I have seen with my own eyes as I have traveled across this country and overseas, that no matter how many highways we build, and doggone good highways that have been really the lifestream of our economy, we nevertheless have continued congestion in many, many parts of our country.
>
> So the only reason that I bit the bullet as I did is that I want to create the opportunity, as I think somebody well put it . . . for this exchange of ideas. If this bold move, if you want to call it that, on my part creates the opportunity and a climate where all of us can really look at this thing in a manner that will provide an answer which will solve the problem, that is all I am looking for.
>
> None of us are looking for glory here. There is plenty of glory to go around. It is purely a case of solving the problem, whether it be in the urban areas or the rural areas, and we cannot place one ahead of the other.
>
> We naturally have to think in terms of the fact, whether or not we like it, and some of us do not, that 80 percent of our people live on 2 percent of the land.
>
> So naturally that is where a good deal of our investment goes.
>
> On the other hand, we just cannot neglect the rural areas. So I hope this exchange we have had will help us. It has certainly helped me and my colleagues. I hope it will help you as you continue these hearings and hear many other witnesses, and then go into executive session [to draft a bill]. I hope you will realize that whatever we have put forward was not something we just dreamed up last week.
>
> Rather, it is something we have been thinking about for many, many months. I trust that this committee, with which I have had such a fine relationship going back a quarter of a century or more, can continue the most favorable climate that we have enjoyed between each other and the Department, and that you will proceed to develop answers that will solve the problems because this is what we are all trying to do. [*1972 Highway Legislation*, p. 528-529]

After viewing the testimony, reporter David E. Rosenbaum of *The New York Times* said that Secretary Volpe's plan to use some Federal-aid funds for mass transit "received a cool reception today from the first Congressional committee to get a crack at it." They "were not hostile," but "indicated in their questions that they were not persuaded that money from the Highway Trust Fund should be spent for anything but highways." [Rosenbaum, David E., "Volpe is Opposed on Transit Plan," *The New York Times*, March 17, 1972]

When testimony resumed on March 21, the subcommittee heard from a Massachusetts delegation, beginning with Representative Silvio O. Conte, a Republican from a district in the western part of the State who served on the Transportation Subcommittee of the House Appropriations Committee. He said:

> I am here today to support the Massachusetts proposal for a dollar-for-dollar transfer of Interstate highway funds within the Commonwealth of Massachusetts . . . . We are not asking for any extra funding for Massachusetts, but rather a reallocation of funds . . . . This simple language change could be a paragraph in the 1972 Federal-Aid Highway Act permitting dollar-for-dollar transfer of funds based on the latest cost estimates of Interstate moneys intended for a given State. Or, it could be done by changing one word in Public Law 90-238 (the so-called Cramer-Howard amendment of January 1968—90th Congress, which was H.R. 13933). [*1972 Highway Legislation*, p. 531-533]

Under Public Law 90-238, enacted January 2, 1968, if a State and the Secretary agreed that a portion of an Interstate route was not essential to a unified and connected system and would not be constructed, the Secretary could redesignate the withdrawn mileage to other Interstate routes or route portions. The law provided 200 miles so sufficient additional mileage would be available where needed for the adjustment.

Representative Conte was asking to shift the Interstate funding from Boston, which did not want it, to western Massachusetts, which was in need of it. He was referring to realignment of State Routes 2, 7, and 8.

The Reverend Robert F. Drinan, a Democrat Representative from a central Massachusetts district, endorsed the dollar-for-dollar exchange to fund upgrading of State Route 52 to Interstate standards. As he put it:

> Tragically, Federal money is available for our inner belt, which the people opposed and which is intended to serve Greater Boston traffic primarily, and very little Federal money is available for Route 52, which everyone supports and which would be a major transportation link between Massachusetts, New Hampshire, Connecticut, and New York City.

The solution was, he said, obvious, namely "changing one statutory provision," to permit the dollar-for-dollar exchange. [*1972 Highway Legislation*, p. 535]

During the question period, The Reverend Drinan commented, "I hope that this distinguished committee will report out the amendment to the bill that we recommend before anything happens with respect to the breaking open of the Highway Trust Fund." This comment prompted Representative James C. Cleveland (R-NH) to lament "the movement to raid the trust fund" and that thanks to that movement, even if such an amendment were adopted, "there might not be any money left in the trust fund to accomplish it. He referred to the "illusory surplus" of $3.7 billion created by "delays imposed on the States by either the highway people in Washington or the OMB." He continued in one long sentence:

> $3.7 billion is sitting there, and that is a target that all these people say is unused, unneeded by the highways, let us go and dip in there for mass transit—let us be frank about it—so they want to go and dip in there, but they ignore the fact—and this is the type of thing that everybody complains about—the credibility gap, no matter what side you argue on, but

> already obligated for approved projects under construction are more than $7 billion. This gives you an idea of the magnitude of the problem that this committee faces.

Just in case anyone was in doubt, he continued:

> And what is happening is the $3.7 billion is piling up because OMB is holding back. Johnson's administration did it, and President Nixon's administration is doing it. They have both been doing it. It is really a mirage. The $3.7 billion unexpended in the trust fund has obligations against it, actual highways have been approved and are under construction of more than $7 billion. And in this mass transit discussion, I just want to be sure that . . . you are aware of the pressures for mass transit, and so is this committee. We have written into our law bus lanes, and we intend to expand on our interest in mass transit, but we just want to be sure that the public and all the members of Congress have the facts. And the facts are that there is no surplus in the trust fund, and, in fact, the unfilled highway needs in this country far exceed what the trust fund can produce. [*1972 Highway Legislation*, p. 538-540]

When the question period ended, The Reverend Drinan introduced the next member of the panel, Secretary of Transportation and Construction Alan A. Altshuler of Massachusetts. Altshuler stated that his primary purpose in testifying was to urge "a very specific provision" be included in the Federal-Aid Highway Act of 1972. It was included in AASHO's recommendations that he said would be presented by AASHO the following day:

> The language of the AASHO recommendation in which we are so urgently interested provided that, where it is determined that previously approved Interstate links cannot be constructed, the responsible officials at all levels of government should be authorized:
>
> > To negotiate a compromise solution, satisfactory to the Secretary, that will satisfy the intent of Congress of completing a connected system and, furthermore, that in arriving at a compromise and negotiated solution, the amount of funds included in the present cost estimate for the section of interstate highway involved, and not the mileage, should be the controlling factor.

This change, endorsed by State highway administrators by a vote of 42-4, would "require no more than the alteration of two numbers in the so-called Cramer-Howard amendment of 1968." The change would be to increase the additional 200 miles under the law, now almost all designated, to 400 miles. He explained that the State had decided not to build the Inner Belt (I-695) that would have cost $307 million and displaced more than 2,000 families, and that whatever they build in its place would be ineligible for Interstate funding. "We may, in other words, end up with projects that absorb large portions of our Federal non-Interstate aid in future years." Given needs statewide, "such a program would be extremely difficult to implement unless the interstate money that had been assigned to the Inner Belt was reassigned to other needed expressway projects." He indicated that the State also wanted to eliminate its 19-mile segment of I-895, the circumferential around Providence that Rhode Island had decided not to build. They wanted to substitute the routes discussed by Representatives Conte and Drinan:

> These two [cancelled] facilities involved a total of 23.6 miles and $358.9 million. Our proposed substitute segments would reduce this estimated cost by about $6 million, but would add 75 miles to the system, for a total of 98.6 miles and $353 million.

He justified the shift by saying:

> We would emphasize that the authorization we seek would not add to the currently estimated completion cost of the Interstate System. Nor would it compromise any of the system's statutory or administrative guidelines. It would only take account of the fact that the major stalled segments at the present time are in densely settled urban areas, where the cost per mile is extremely high, and that the most likely substitute segments are in open country between cities, where both cost and traffic volumes per mile tend to be much lower, but where the traffic service that can be purchased per dollar of investment is often greater.

He added that Governor Sargent "asked me personally" to convey his appreciation for the rapid progress Congress made "in recent years toward an appropriate balance in the structure of funding for transportation improvements." The Governor and Secretary Altshuler applauded the way the Committee on Public Works had "moved Federal highway policy in recent years along a path of evolution that has gone far toward keeping it in turn with changing national priorities, and with developing insights into the methods by which transportation needs may be satisfied in ways optimally compatible with other environmental and urban needs."

Since change was inevitable, he said he supported all the AASHO recommendations except one:

> Our only dissent from the AASHO program is with regard to the frequency with which Congress should review the Federal Aid Highway program. Though AASHO recommends a review only once every 4 years, we believe that the current pattern of more frequent review and authorization has proven invaluable as a means of keeping the program in tune with the times as new priorities and understandings have emerged over the years. [*1972 Highway Legislation*, p. 541-546]

Committee counsel, Lloyd A. Rivard, informed Altshuler that I-895, having been designated in response to the 1,500-mile addition authorized by the 1968 Act, was not eligible for the Howard-Cramer substitution. Altshuler said:

> I think the critical thing so far as Congress is concerned may not be the evaluation of whether each of our proposals is eligible. It may be that you enact general language and then leave it to the Federal Highway Administration to determine which of our specific proposals to approve.

He said that he had met with Administrator Turner on two occasions and that he was receptive to mile-for-mile trades. [*1972 Highway Legislation*, p. 546-548]

Following the Massachusetts delegation, the subcommittee heard from D. Grant Mickle, president of HUFSAM, Peter Koltnow, vice president for professional affairs, and James Granum, manager for transportation development. Mickle said that over the past year and a half, the organization had analyzed data put together by State and local agencies for the highway functional classification and needs study required by the 1970 Act. Based on that information, HUFSAM Chairman Roy D. Chapin, Jr. (chairman of the board, American Motors Corporation) had put together a draft for a continuing highway program.

HUFSAM's seven recommendations included authorization of the Federal-aid highway program for at least 2 more years and designation of the realigned Federal-aid systems based on the functional classification exercise. The group also recommended extending the deadline for Interstate completion through FY 1979, with funding tapering off after FY 1976. It also wanted the Department of Transportation to work with State and local agencies "to undertake development of performance standards for each new Federal-aid systems [sic]." The Department also should launch a research and development program "looking toward new solutions to urban transportation problems" and "develop new guidelines for assuring citizen participation in decisionmaking, and for encouraging minority groups economic benefits [sic] from highway development, and providing manpower training for them."

Perhaps HUFSAM's most surprising recommendation was a proposal to use $300 million annually from the Highway Trust Fund to improve public transportation. The group's analysis showed that in all urbanized areas, only 7 percent of trips were on public mass transportation, with two-thirds of those trips by bus and the rest by rail. Estimated capital needs for all urban public transportation totaled $65 billion, with buses and related facilities accounting for $10 billion of that total. Whatever the mix, cities were faced with congestion. HUFSAM supported increased funding for urban arterials to increase safety as well as capacity, but Mickle continued:

> Still, other opportunities to improve traffic flow and meet our total transportation needs must be utilized. Potential lies in upgrading the quality of our public transportation services as extensively as possible around the country.
>
> At the same time, we do not believe that the answer, in any appreciable terms, lies in returning to transportation methods which fit the land use patterns at the turn of the century. Even a mix of such methods with automotive transportation offers limited hope.

New solutions were needed, he said. "We believe that highway users do have a direct stake in finding modern transportation solutions to problems posed by today's and tomorrow's metropolitan trends."

Improvement of bus mass transportation service would contribute to the overall relief of congestion and benefit truck and private car operators. "On this basis, we proposed that an annual average sum of $300 million be made available from the trust fund for 10 years, matching at a 70 Federal-30 local ratio to meet over 40 percent of the long term capital needs of urban bus transportation, including purchase of buses, terminals, and storage yards." Projects would be contingent on finding that the capital improvements would measurably upgrade transit service and that local authorities "are capable of continuing such services." This program would "supplement and not replace the current funding," while Federal-aid highway funds would remain available for special bus lanes and fringe and corridor parking as at present.

HUFSAM opposed the use of Highway Trust Fund revenues for transit operating expenses:

> To subsidize operating expenses could underwrite bad operation. Furthermore, operating buses is a private and public business for which there are no Federal controls, no Federal standards nor criteria. We would consider it a breach of trust to use trust fund moneys under these circumstances and for this purpose.

Asked by Congressman Mike McCormack (D-Wa.) about the Interstate segments "where there are hang-ups of one sort or another," Mickle and Koltnow responded:

> Mr. Mickle. We would not necessarily expect that those sections that are hopelessly deadlocked and no chance whatsoever of getting an agreement will be completed. Perhaps some alternative would be provided, if it is a city section, a bypass, or something of that kind.
>
> Mr. Koltnow. The extension of the deadline for completion is required because it is certainly going to take time to build even those roads that are agreed upon and not points of contention. We do call for an extension of perhaps 2 years in the filing of schedules for completion, and I think after that point in time if there are segments on which there is simply no agreement, they would disappear from the Federal-aid system as currently set forth in the law. [*1972 Highway Legislation*, p. 574, 576]

On March 22, the subcommittee heard from AASHO. J. C. Dingwall, president of AASHO and State Highway Engineer of the Texas State Highway Department, took the lead. He had little good to say about the Administration's proposals:

> In some ways, this is an unusual hearing since we are not testifying on a bill, and since the administration's revenue sharing proposal, reflecting certain political implications, has been resubmitted masqueraded as the 1972 Highway Needs Report.

He explained that AASHO had adopted 22 recommendations during a meeting of the "After 75 Committee" in Chicago on March 14, 1972. They did so under difficult circumstances:

> Also, just before the meeting discussions were concluded, and after we had reviewed the outline of the administration's so-called Needs report, obtained through a DOT briefing in Washington and given to us by phone by AASHO staff, Federal Highway Administrator F. C. Turner, arrived and read a prepared statement, and handed out copies of the 1972 Highway Needs Report, after which we proceeded with our balloting on the 22 recommendations to you.

With little time to review the report, AASHO had to adopt its recommendations despite not having time to contact its constituent groups about the new Administration proposals.

One of AASHO's recommendations was to authorize $1 billion a year for the relief of urban congestion by utilizing highway-type measures emerging from an objective transportation planning process consistent with the continuing, comprehensive, and cooperative (3C) process required by the Federal-Aid Highway Act of 1962 . This recommendation emerged from discussion with the National League of Cities:

> We still believe this is a sound recommendation, one that is very much in the public interest, and does not violate the intent or purpose of the Federal Highway Trust Fund . . . . We definitely do not view it as immoral, illegal, nor contributing to an unfair advantage of motor vehicle transport over other modes, but we do believe it should be used for its intended purpose, and it is inadequate to even satisfy those needs, and it is the case of the user paying for his own facilities.

AASHO did not object to any other mode of transportation, or establishing a trust fund for its development, "but we do object to the Highway Trust Fund being raided for the purpose."

As his initial comments made clear, he did not trust the 1972 Highway Needs Report. It was, he said, "really the transportation revenue sharing program taking certain liberties with the Highway Trust Fund." He had asked to see FHWA data and the original draft "because in our opinion [the final report] is truly not a highway needs report in its released form." Dingwall, speaking for AASHO, objected to the data in the report, how it was interpreted, and the conclusions drawn. He wanted to know "to what extent recognized competent highway expertise" was involved in preparing the final report.

By proposing to "fragment the Highway Trust Fund into five separate accounts," the proposal would delay completion of the Interstate System to the mid-1980's, "which is too far in the future." He said AASHO had "grave reservations" about Single Urban Fund revenues "bypassing State government and going directly to creatures of State government—the SMSA's, and some concern about funding and programming decisions being made by elected officials at those levels, unless based on objective and factual 3C total transportation planning." He explained:

> The State highway departments having the responsibility to build, maintain, and operate a statewide highway system, do not want to lose highway extensions in urban areas through Federal legislation.
>
> To fragment jurisdiction over the various segments of the official State highway system between State and urban officials could only deteriorate the State highway system.

Based on the latest Interstate Cost Estimate, completion at the rate of $3 billion a year would take at least another 13 years. At $4 billion a year, completion could be achieved in 10 years. "This is in itself a long time to wait for the completion of an essential transport system that was begun in 1956, and thought could be completed by 1969, then 1972, then 1976, then 1977, and now, according to the Administration's proposal, 1979." The Nation must "strive for a connected system that will allow through travel in all sections without undue delay, due to local traffic congestion."

He commented on the remaining segments:

> We firmly believe that within the time frame that will necessarily be involved in completing the Interstate, that practically all controversial gaps can be resolved through a compromise of location and adequate design, and if there are any gaps that will not be built, they will undoubtedly be a few city projects where it might be necessary to construct bypass routes, or expand the capacity on existing ones in order to serve the traveling public and provide a connected system.

In closing his remarks, he said:

> In summary, we wish to state that the highway program is not overfinanced, nor are we anything close to the final "inning" of the Interstate program. The percentage of completion of the Interstate is based on mileage, and not on money, and it means that we have built, generally, the simplest and cheapest sections to date. [*1972 Highway Legislation*, p. 588-600]

David Stevens presented AASHO's 22 recommendations. He was chairman of the Maine State Highway Commission and was slated to become the first commissioner of the Maine Department of Transportation when it began operations on July 1, 1972.

(After creation of the U.S. Department of Transportation, the States began organizing similar departments. In 1967, New Jersey became the first to establish a State department of Transportation, with New York's department opening later that year. With the U.S. Department aggressively promoting conversion by the States, 20 States and Puerto Rico had followed the example by 1973. On November 13, 1973, AASHO's Policy Committee approved a new name for the organization, the American Association of State Highway and Transportation Officials, and a broadened mission and membership to include all forms of transportation. [*AASHTO 1914-1989: Moving America Into The Future*, American Association of State Highway and Transportation Officials, 1990, p. 14])

AASHO recommended retaining the 70-30 match included in the 1970 Act "because, quite frankly, we have heard some disturbing rumors to the effect that there might be some desire on the part of the Administration not to match Federal funds on a 70-percent basis." Stevens explained AASHO's recommendation, cited earlier by ARBA, that the reauthorization cycle be changed from 2 years to 4 years. This would be helpful because "we are having more and more difficulty within the present time frame of about 6 years or more, bringing our projects to the contract stage." The 4-year reauthorization pace would ensure continuity and stability over the longer project development time frame.

The recommendation of $4 billion a year for Interstate completion was essential to avoid stretching the time line out any more than necessary. This total would require preserving the Highway Trust Fund and being sure "that we have no diversion from our trust fund to other modes of transportation."

The proposal that $1 billion be provided for highway or highway-related improvements to relieve congestion was "one of our most important recommendations." Projects such as fringe parking or extra bus lanes, would be selected by State highway officials "with the advice of appropriate local officials."

Asked about the source of the additional funds, Stevens said he thought they could come from revenue in the Highway Trust Fund for the next few years and that after that, "excess revenues would take care of these particular authorizations we are suggesting." These comments prompted Congressman Cleveland to emphasize the nature of the Highway Trust Fund balance, currently at $3.8 billion with projects under construction for $7.8 billion. He told Stevens:

> In other words, the money that has been actually earmarked is actually twice that surplus, if my figures are correct. But I do not think you are getting that point across to the public. I do not think you are getting it across even to the Congress. We know what has happened, thanks to these cut-backs and hold-backs. There is this apparent cash balance in the trust fund. It is getting bigger every year. The bigger it gets, the more inviting it gets. Correct? But I do not think you are getting that point across to the public and that is why we are in trouble . . . . There is a big question whether there is enough money in the trust fund to do the things we have to do to build safe highways, save lives and just do what we must do. We are fighting a losing battle here in Congress.
>
> Do I make myself clear?

When Dingwall said he understood, Representative Cleveland told him, "I just think you have got to be much more tough and hard-hitting on these facts." He added, "Let us face it, it is my [Republican] administration, but my administration is deliberately misleading the American people on this connection."

Stevens went on to discuss the recommendation that the current law allowing exchange of funding among categories should be increased from 20 percent to 50 percent. This would allow the States the flexibility to determine their individual needs. He also explained that 20 percent of funds for the Federal-aid systems should be available for expenditure on non-system roads. The funds could be used to correct hazardous locations and construct other safety projects, with local governments sometimes providing the matching funds.

AASHO endorsed equitable reimbursement to the States for the toll and toll-free Interstate roads built with State funding prior to adoption of the 1956 Act and incorporated into the System. This subject had been a point of contention during development of the 1956 legislation, with States that had built Interstate segments, whether toll or free, arguing that if they were not reimbursed under the new program, they would be treated unfairly in comparison with other States that had not taken the initiative. The 1956 Act called for a study of the routes involved, but Congress had not acted on reimbursement. (Congress would not do so until the Intermodal Surface Transportation Efficiency Act of 1991 authorized partial compensation to the States.)

AASHO also wanted Congress to enact legislation to address the problem of Interstates that were not being constructed. The legislation would allow "these State highway departments to make an attempt to negotiate for some kind of compromise in these areas in order to provide for a continuous Interstate System, but not necessarily on the same location, as was originally intended."

In response to a question from committee counsel Rivard, Stevens elaborated on the recommendation:

> Our intent here, Mr. Rivard, is to require or provide them with tools, I should say, for negotiation within the vicinity of the original location, still with the objective of providing a continuous network of Interstate routes. Our suggestion does not provide for abandoning entirely the continuous and connecting routes at that location, and moving the money dollar-for-dollar into a distant part of the State on highways which perhaps were not even part of the State highway system at one point.

As for these stalled routes, Stevens said AASHO wanted to extend the deadline, contained in Section 124 of the 1970 Act, for the start of construction of each segment, while retaining the deadline of 1973 for finalizing PS&E. Congress should allow the Secretary "to establish a more realistic date than 1975, where there is difficulty getting the project underway."

Rivard asked about the 1973 deadline that Secretary Volpe had proposed to extend by 1 year. AASHO's executive director, A. E. Johnson, responded that AASHO might want to consider an extension of the 1973 deadline. The 1975 date had been selected for construction because it was 2 years before "the so-called completion date of 1977" for the Interstate program as provided for in the 1970 Act:

> We all knew that 1977 was not going to be the completion date. But if we can make a negotiated compromise solution of a project in 1973, and it takes 6 years to get PS&E, the 1975 date is no good, it has to be extended, and the program time frame by necessity will extend to 1980 or later, so the 1975 date is not reasonable nor essential.

The delays were in some cases caused by legal actions throughout the country. Congress could address this problem by "requiring appropriate bond be established for those bringing action which would result in delaying the project." Stevens realized that objections had been raised to this suggestion because "there would not be an opportunity for poor persons to have an adequate day in court." He said:

> We have deep confidence in our judicial system to look after the welfare of the poor, but we are thinking about the frivolous suits which are being brought which, in turn do hold up projects with a very minimum amount of bond, which could result in considerable cost to the taxpayers and the State Highway Commission and the Federal Government.

When Stevens completed his presentation, Chairman Kluczynski took the opportunity to acknowledge the presence of "one of the great men in the country, and man who has built America [sic]—the father of the Interstate Highway Act of 1956, our former chairman, George Fallon. The transcript notes: [Applause.] Referring to the 1955-1956 period, he said, "You did a marvelous job, George. You are one of the fellows who has built America. We are going to continue building America." [*1972 Highway Legislation*, p. 611-624]

Other pro-highway groups testified during the hearings. AGC, testifying on March 23, reported that it had adopted resolutions concerning reauthorization. L. P. Gilvin, a contractor serving as chairman of AGC's legislative committee, presented the recommendations, which included support for a Mass Transit Trust Fund with "sources of revenue other than those presently supporting the Airport and Highway Trust Funds." The organization opposed impoundment, but favored receipt of "adequate financial security to indemnify and protect" States when filing suit to block projects, a 4-year reauthorization cycle, a 70-30 Federal-State matching ratio, and extension of the deadline for PS&E on Interstate projects, among other proposals. [*1972 Highway Legislation*, p. 663-667]

The American Automobile Association (AAA) also testified on March 23. J. B. Creal, executive vice president, began by referring to the Secretary's proposals:

> Mr. Chairman, events of the past week make it apparent that perhaps the most important issue facing this subcommittee at this time is the matter of a possible breach of faith with the highway user, the man who pays the money which makes the trust fund a reality . . . . The AAA was extremely disappointed by the administration's recommendations last week that the Highway Trust Fund be raided for nonhighway purposes.

The 1972 Highway Needs Report documented "that vast sums will be required to meet highway needs through 1990" but "the administration has decided to discount these needs." Moreover, the report did not attempt to "truly justify why the users of the highways should shoulder the burden of financing mass transit facilities." General funding for mass transit was "the most equitable means of financing the program," which AAA had supported in 1970. If highway user taxes were not going to be used for their intended purpose, they should be repealed, Creal said.

AAA had opposed the Federal gas tax for many years before 1956, and as Creal acknowledged, had opposed earmarking of highway user revenues to build the Interstate System. Since the Interstate System would benefit the entire country, not just motorists, AAA had favored the use of general Treasury revenue for its construction:

> AAA had severe reservations about the fairness of user charges underwriting the entire cost of this program. AAA still has such reservations and retains its position that an equitable tax base for both highway users and nonhighway user beneficiaries be enacted.

Now, the program's success was "causing its detractors to cast covetous eyes on the financing arrangement—the very rudiment of the system."

Creal also disputed that transit had suffered because of the focus on highway development. New York City, which had been leading the charge for diversion of highway revenue, was unique and hardly typical of the urban problems in other large cities. In most cities, "provision of appropriate transportation facilities is inseparable from land use decisions." Decentralization of population, retail facilities, and industry favored the automobile and buses, not the type of rail transportation possible in New York City.

In summary, he said AAA's position was that the 1972 Highway Needs Report revealed needs so great that the Highway Trust Fund must be kept intact; highway user taxes should be used exclusively for highway programs; and public transportation where needed should be financed with general revenues. In closing, Creal quoted Secretary Volpe's March 1970 testimony before the House Banking and Currency Subcommittee on Housing:

> The establishment of a trust fund was very thoroughly considered by the administration. The essence of the trust fund concept as it exists for highways and as it is proposed for airports and airways . . . is the contribution of revenues into the fund from those who will use the facilities created by expenditures from the fund. As the term indicates, these are revenues held in "trust" by the Government in [sic] behalf of the special taxpayers . . . .
>
> The administration's final decision to fund the public transportation program from general revenues flows from the inevitable conclusion that public transportation is really a public responsibility. This responsibility should be met by all of the taxpayers and not by a select group of them. [*1972 Highway Legislation*, p. 689-698]

The American Trucking Associations (ATA) testified on March 29. William A. Bresnahan, ATA's president, began by expressing the organization's strong support for the Interstate System. "We still have left the bold, and highly justifiable, program laid out in the Federal-Aid Highway Act of 1956." Its members were willing to pay their fair share for the program's completion, but "we feel just as strongly that if the highway program is stopped, our special highway taxes should be stopped." ATA considered its members' contributions to the Highway Trust Fund to be "special taxes levied for a special purpose and related to a specific Government program." If the program were curtailed rather than stopped, the special taxes should be curtailed in the same amount.
The calls to "siphon away trust fund revenues" come mainly from mass transit advocates who do not acknowledge that for much of the country "the only feasible form of mass transit now and in the foreseeable future, is the motor bus operation on highways provided by highway taxes." Secretary Volpe's suggestion that the trucking industry should welcome diversion of highway taxes, possibly for some form of rail transit, "is completely off the mark." The trucking industry needed completion of the Interstate System and improved roads and streets in urban areas to relieve the burden of congestion. [*1972 Highway Legislation*, p. 879-881]

The recommendations by these highway-oriented groups were to some extent predictable. As reflected in the testimony of the Highway Action Committee, the subcommittee also heard from groups and individuals with a different perspective.

On March 15, Representative Koch testified in support of his bill to establish a transportation trust fund and his bill authorizing construction of exclusive or preferential bike lanes. He endorsed Secretary Volpe's proposal:

> On the whole, I believe that the 1972 Highway Needs Report's recommendations represent a recognition that there are critical transportation problems in our urban areas that can be met only if states and localities are given flexibility to direct our transportation resources into those facilities that can provide the fastest and most convenient means of transportation possible.

He was concerned that under the proposal, too much funding would go to Interstate construction and not enough to the Single Urban Fund. "I believe that our urban transportation needs greatly exceed the Secretary's funding recommendations." He understood the subcommittee's position in this debate:

> I realize that there is considerable pressure on the Committee to continue the single purpose of the Highway Trust Fund: highway construction and safety. But I would submit that to continue to provide an isolated funding program just for highways inhibits our ability to provide a balanced transportation system and optimum mobility for our people. Furthermore, setting aside for highways such an enormous share of our transportation resources will only contribute to the further deterioration of our public transportation system and the escalation of the mobility crisis that now stagnates many of our urban areas.

The bicycle was part of the solution to the urban crisis:

> Last year the country was swept by a tidal wave of bicycling enthusiasm and I predict that with the arrival of spring, we will find millions of adults riding their bikes daily to and from work.

In addition to being "mechanically very simple," the bicycle "emits no pollution, makes little if any noise, takes up little room and even has physical and mental benefits for the rider." However, danger occurred when cyclists "are forced to compete with cars and buses in heavily congested streets." Congress must, he said, do its share in providing localities with financial assistance to develop the needed lanes, build bicycle shelters and provide bicycle traffic control devices." [*1972 Highway Legislation*, p. 439-441]

Representative Schwengel commented that if Congress directed all Highway Trust Fund revenues to New York City for 10 years, that "still will not solve your mass transit problem." He advised Koch to "come to us with an estimate of the cost and the way to pay for it." Koch said that what distressed him was that Congress only in 1970 began authorizing significant funding for mass transit, but only a portion of that funding had been made available, most recently $600 million for mass transit while another $4.5 billion was made available for highways. "I do not think that was fair." He estimated that applications from the cities on file at UMTA as of 1971 totaled $17 billion, with New York City seeking $2 billion for the Second Avenue subway project, a 14-mile line from Whitehall Street at the southern end of Manhattan to East 180th Street in the Bronx.

Why, Representative Schwengel asked, should not the people who use mass transit pay for it? Koch replied, "Let me point out why they cannot. One is there is a limit as to what someone can afford to pay for an essential service." Most observers had come to the conclusion that "the fare box cannot bear the entire cost." Moreover, he asked, why should transit passengers pay full cost when one considers the subsidy provided to the automobile, including street maintenance, pothole repairs, special offices, traffic signals, and the cost of pollution.

Representative Schwengel was receptive to the bicycle idea because he had observed in his home State that at the University of Iowa, "the university said no more automobiles, bicycles only, and they got bicycles by the thousands." Chairman Kluczynski also was interested, saying of his hometown of Chicago, "Mayor Daley also rode a bicycle a month ago and now you cannot buy a bike in Chicago." Koch assured them that, "I intend to keep lobbying with you over the dinner table." [*1972 Highway Legislation*, p. 458-466]

Later that day, John Auerbach, executive director of the Bicycle Institute of America, Inc., testified. The group, a trade association representing the domestic bicycle industry, had seen "bicycle popularity grow enormously in both dimension and character." Saying that history repeats itself, he reminded the subcommittee about the role of bicycles in the 1880s and 1890s in promoting good roads. "And bicycle enthusiasts know today, as did their forebears almost 100 years ago, that riding space is the basic essential for bicycle expansion." He continued:

> This basic essential has never been more obvious and more pressing than it is today. The bicycle has come of age, and millions of American cyclists from all walks of life and from all age groups, are once again pressing State, Federal, and local legislators—not for more roads for cars, but for more bikeways, paths, and trails for bikes.
>
> This has become one of the most powerful grass roots movements that has ever been associated with any industry. It is truly an amazing phenomenon.

Already the movement had prompted some States to open their highway trust funds to bicycle facilities. Now, Federal funds must be made available:

> The argument has been presented that bicyclists don't pay any highway use taxes, so why should they share in Highway Trust Fund revenues. I respectfully submit that this argument is fallacious. Bicyclists and their families already own at least one and in many cases two automobiles that more than pay their own way. The bicycle is not supplanting the automobile . . . . Rather, motorists are also buying bikes to be used along with, not instead of their cars.
>
> But even if this were not true, the argument would still be invalid. If it were not, the childless family should not be taxed to support a school system it does not use, the man who has neither committed a crime nor been the victim of one should not have to support the police department . . . . Obviously, the betterment of society as a whole is the issue; the promotion of the general welfare, if you will, and no group of citizens is exempt from either the benefits or responsibilities of that time honored doctrine.

In short, the institute supported Representative Koch's Bicycle Transportation Act. [*1972 Highway Legislation*, p. 475-481]

Representative Bella Abzug (D-NY) appeared before the subcommittee on March 23. Following her election to the House in 1970, she had been assigned to the Committee on Public Works but not to the Subcommittee on Roads. She told her colleagues that the "transportation situation in our urban areas is at a crisis level," with transit facilities unable to keep up with demand while continuing to deteriorate from lack of maintenance, and fares were increasing to levels that riders could not afford. Meanwhile, in crowded urban areas, "autos are extremely inefficient." She said, "Purely and simply, the reason for this is money." She contrasted funding for the Interstate System and mass transit:

> The message of this comparison cannot be lost on anyone, and is certainly clear to State and local officials: Build more highways, especially superhighways, and we in Washington will pay almost the entire bill; build mass transit facilities and you are on your own.

She summarized her point. "What I am trying to say is that we must stop looking upon the Highway Trust Fund as a sacred cow and start being realistic as to our transportation needs." She added:

> I think that what we are talking about is the dire need for a Federal transit operating and maintenance subsidy; to get a 90-10 contribution from the Federal to the local, in the same way we have it in the highway system. The question of travel involves both highways and urban mass transit, and we have to find the ways in which we can fund them from common resources. I believe that those resources exist in the Highway Trust Fund.

Representative Schwengel told the Congresswoman that he questioned why the committee should use "some of the cash we collect from the users of the highways to pay for those who do not use the highways." Why, he wanted to know, should not the users of mass transit facilities "pay a little bit extra for improved services and reduced costs?"

Representative Abzug replied that, "I think there is a fallacy in all of these arguments and I really think it is about time we really came to grips with it." She said that, "It is not a local problem that I am discussing, but a national problem."

> It is unfair to take the position that only one aspect of travel in this country should be taken care of and all other aspects suffer as a result. We pay a price. Every city pays a price for having a trust fund being built up which is used only for highways. Highways prevent cities from getting other revenues. I am not going to go through the arguments—the property tax losses from land taken for highways and so forth.
>
> What I want to bring to the attention of this committee is that we are talking of a broad range of transportation services and there has to be some way to coordinate and correlate them and the way in which we raise the funds to maintain them. They are not isolated any longer. Cities have sprawled out. Urban transit relates to the highway fund, and there should be some correlation in terms of financing.

New York City, like other cities, faced "crisis after crisis" in raising funds for needed services, including its transit system. She pointed out that more tax revenue came from New York City to the Federal Government than was returned. "We are in constant crisis, and I think it is time for this committee to utilize its great creativity and its enormous intelligence and to create the concept of a trust fund that can be spread to more people than the automobile users."

Representative John H. Terry (R-NY), whose district was in the Syracuse area, mentioned the 1971 transportation bond issue that the people of New York, including the people of New York City, had rejected. He thought they rejected it because of "the tremendous acceleration in operation costs," such as salaries for transit workers. Abzug disagreed, arguing that the people of New York City "opposed it because they felt that too large a part of that bond issue was to be allocated to building more highways."

They then discussed a possible source of revenue for a Mass Transit Trust Fund. She suggested the balance in the Highway Trust Fund as a possible source (Terry explained that the surplus was not really a surplus), but an additional tax on gasoline to fund a separate mass transit account was worth considering. She said that her purpose was to make clear "that we are responding very favorably to the proposal that has come forward from Mr. Volpe that there be some commitment of highway trust funds to mass transit." [*1972 Highway Legislation*, p. 649-661]

(Representative Abzug, who would be a strong advocate for transit over the next few years, was said to have been "born yelling." She was a lawyer, feminist, and social and antiwar activist who became a celebrity and frequent television guest known for her big hats, sarcastic humor, and what the author Norman Mailer described as a voice that "could boil the fat off a taxicab driver's neck." Author Vincent J. Cannato described her as "perpetually dissatisfied" and quoted an aide, Sid Davidoff, who said, "Bella was truly a bull in the China shop. When Bella calls you, as you're picking up the phone she's already yelling at you. She hasn't identified herself. You don't know what the issue is, but you're hearing her voice on the other end yelling at you." In 1976, she gave up her House seat to run for the Senate, but lost in the primary to Daniel Patrick Moynihan. [Cannato, Vincent J., *The Ungovernable City: John Lindsay and His Struggle to Save New York*, Basic Books, 2001, p. 422, 502])

Representative Ryan testified on March 29 that the reason for "our desperate predicament is that, while we have spent dollar after dollar on producing larger and more extensive highway systems, we have kept mass transportation on a starvation diet." The notion that the automobile was the only feasible mode of urban transportation could not be "further from the truth." He explained, "Inner city bumper-to-bumper traffic, accidents, smog—all call for applying the brakes to the automobile commuter age." The Nation needed "effective and efficient mass transportation systems."

He had again introduced the bill he had first unveiled in 1966 to allow the States to decide whether to use Highway Trust Fund revenue for highways or mass transit. He recalled the arguments in previous years over whether his bill was germane as an amendment to Federal-aid highway or transit bills. "We can no longer allow such parliamentary maneuvering to impede the development of urban mass transit." Secretary Volpe's proposal to open the Highway Trust Fund to urban transportation needs "was most welcome." He urged the subcommittee "to seize this opportunity to take affirmative action on my proposal." The importance of his proposal was not in doubt:

> The fate of our mass transit system is the fate of our cities. It is a must . . . . It is essential to build a balanced transit system. We must not misinterpret a spiderweb of highways as a modern mode of urban transportation. [*1972 Highway Legislation*, p. 851-853]

Chairman Kluczynski anticipated that he and other members of the subcommittee had many questions for Representative Ryan, but because of their tight schedule on the day before the Easter recess, they would send them to him to reply in writing. He agreed, but the hearing transcript included neither the questions nor his replies.

The hearings concluded on April 12, 1972.

The Administration Bill

On April 21, Secretary Volpe submitted the Department's legislative proposal, the Federal-Aid Highway and Mass Transportation Act of 1972, to Congress implementing the plan outlined in the 1972 Highway Needs Report as well as a stepped up safety program. Senator John Sherman Cooper of Kentucky, ranking Republican on the Committee on Public Works and the Subcommittee on Roads, introduced the bill as S. 3590 as a courtesy to the Administration while Congressmen Blatnik and Harsha introduced the bill in the House, also as a courtesy, as H.R. 14759. Senator Cooper had represented Kentucky in the Senate since 1946 (interrupted by a stint as Ambassador to India in 1955-1956).-

The legislative proposal incorporated the innovative Single Urban Fund and the Rural General Transportation Program, while continuing to fund the highway beautification and junkyard control programs established in 1965.

Under the Single Urban Fund, 40 percent of the funds would be distributed to the Nation's SMSAs according to each SMSA's share of the total SMSA population. Another 40 percent would be allocated to the States based on urban population while 20 percent would be reserved for discretionary use by the Secretary on urban mass transportation projects. The Federal-State matching ratio for all projects would be 70-30.

The news release announcing the proposal explained the metropolitan project selection process:

> It is proposed that each SMSA form a consortium of the local governments within its area to carry out the local urban transportation programs. It would be required that each consortium provide for representation by the highest elected official in each local government in the area; that it have a planning authority for all transportation modes and that no program could be initiated which was not in conformance with that planning; that it require proportional voting within the consortium, be authorized to prepare long-range planning and possess the authority to designate agencies to administer programs.

> Also, the consortium would be required to develop a multi-year comprehensive transportation plan for each program to be financed through the Single Urban Fund. All SUF programs would be subject to the same Federal review and approval procedures as those now in force for such projects.
>
> In the event that an SMSA did not choose to form a consortium, the funds allotted to it would be retained for management by the State. Local officials within the area would then develop plans in cooperation with the State for programs to be financed through the Fund, subject to Federal approval.

The idea of a metropolitan planning consortium was a step forward for the transportation planning process. In the Federal-Aid Highway Act of 1962, Section 9 ("Transportation Planning in Certain Urban Areas") had prohibited the Secretary of Commerce from approving any program of projects after July 1, 1965, in urban areas of more than 50,000 "unless he finds that such projects are based on a continuing, comprehensive, and cooperative transportation planning process carried on cooperatively by States and local communities . . . ." How State and local officials were to carry out the 3C planning process was left to them and in many cases, the State highway agency conduct or oversaw the process. Now, under Secretary Volpe's proposal, local officials would be encouraged to establish a consortium that would select projects through the 3C process.

In discussing the proposed legislation, the Secretary explained:

> We have reached the point where the localities must be given more flexibility in structuring their own urban transportation programs. The interstate system is well on its way to completion. Therefore, while our national commitment to an efficient transportation system is no less, the need for strong federal control has decreased.
>
> Now is the time for those nearest the problems to take the initiative in meeting their transportation challenges. Now is the time to break away from the established pattern of separate highway and mass transit programs.

For rural areas, the proposal would establish a Rural General Transportation Program, with $200 million a year for FYs 1974 and 1975. States could use the funds for surface transportation systems and facilities outside of metropolitan areas, including highways on or off the Federal-aid systems, bus and rail transit facilities, and rolling stock.

The Administration bill also funded the Federal-aid primary and secondary systems:

> The legislation would implement the recommendation of the Highway Needs Report that the present primary and secondary federal-aid systems be restructured to more accurately reflect the current and anticipated future functional uses of these highways. This program would be funded at a level of $800 million in fiscal years 1974 and 1975.

> Under the terms of the bill, the primary system would provide a system of connected main roads important to Interstate, statewide, and regional travel consisting of rural arterial routes and their extensions into or through urban areas of under 50,000 population.
>
> The secondary system would consist of rural major collector routes and arterial routes in urban areas of under 50,000 population.

The bill did not propose changes in the Interstate program, but did phase down funding levels from the current $4 billion a year to $3.25 billion a year in FYs 1974 and 1975; $3 billion for FYs 1976 through 1979; and $1.257 billion in FY 1980. Secretary Volpe said, "These authorization levels will then more accurately reflect the estimated levels of construction during these years."

The Federal share would remain 90 percent for Interstate construction, but the Federal share for all other projects, including mass transit, would be 70 percent.

Secretary Volpe also submitted a legislative proposal to amend the Highway Safety Act of 1966. Since then, Secretary Volpe said, the "combined Federal-State effort is beginning to show benefits." Still, 300,000 people had been killed in highway crashes since 1966, including 55,000 people in 1971. Much work, he said, remains to be done. Secretary Volpe explained that, "The purpose of this legislation is to amend the Act to improve the Department's effectiveness in preventing highway accidents and deaths and injuries resulting therefrom." (For information on the 1966 legislation, see "Epilogue: The Changing Federal Role" in *President Dwight D. Eisenhower and the Federal Role in Highway Safety* at http://www.fhwa.dot.gov/infrastructure/safetypr.cfm.)

The proposal would increase Highway Trust Fund revenue for State highway safety programs, require States to incorporate in their comprehensive and annual works programs all national emphasis programs designated by the Secretary of Transportation, provide incentive grants to encourage States to increase their funding commitment to highway safety, give the Secretary more flexibility than in the 1966 Act to penalize States not implementing an approved safety program, and clarify the Secretary's authority to promulgate a standard on planning, administration, and evaluation of comprehensive State safety programs.

Observers gave the highway/transit plan little chance of adoption. The May 4 issue of *Engineering News-Record* headlined an item in its Washington Observer column: "Volpe's Transit Fund Plan Bogs Down Early." It began:

> There's not much chance that Transportation Secretary John A. Volpe's plan for highway and mass transit funding will get very far this year . . . . Legislation to implement a plan that includes the controversial single urban fund concept just went to Capitol Hill last week, only to be met with indifference by the House Public Works Committee.

The Subcommittee on Roads, the column said, "was well on its way to working up a draft bill when Volpe's plan arrived." The subcommittee's bill was expected to reflect "its plan for developing a program for the transition period between the completion of the Interstate network and upgrading other systems." Volpe's plan "seems to satisfy no one." Transit groups "are opposed because they fear it will end hopes for a larger, separate mass-transit kitty." Highway interests opposed any diversion of highway user tax revenue. Although Volpe had asserted before a meeting of ARBA that his proposal was just an opening move in negotiations, the prospects were dim. ["Volpe Transit Fund Plan Bogs Down Early," Washington Observer, *Engineering News-Record*, May 4, 1972, p. 7]

An editorial in *The Journal of Commerce* agreed that Secretary Volpe's plan was "running into heavy weather," saying:

> [It] is clear that there is still powerful opposition to any and all plans to put any of [the new equipment and technology] to the test unless it can be fitted into the highway program—especially if it involves a limited release of highway trust fund revenues for urban transit purposes.

It is "perhaps natural" the proposals to divert highway funds to mass transit "should be considered shocking by those convinced that the Interstate Highway Program has been endowed with some heaven-sent priority over all other transportation needs." Why, the editorial asked, should "the special tax funds levied on virtually the entire population . . . be sequestered indefinitely in sacrosanct vaults and distributed in such a lop sided fashion." ["The Highwaymen," *The Journal of Commerce*, May 24, 1972]

On June 8, the Washington Observer column reported that the House Public Works Committee had nearly completed its bill, although work on the water pollution control bill was delaying release of the legislation. It was expected to continue the Federal-aid highway program as in the past, with increased funding for highway-oriented mass transit facilities. ["Biennial Highway Act Shaping Up," Washington Observer, *Engineering News-Record*, June 8, 1972, p. 7]

In a 1972 interview with *Government Executive* magazine, Under Secretary Beggs discussed the origins of the Single Urban Fund proposal. The article began:

> In the case of the current Administration's highway program, and Urban Mass Transit, genesis began with conversations several years ago "with almost everyone in the domestic side of the White House and the Office of Management and Budget," according to Under Secretary of the Department of Transportation James M. Beggs.
>
> "There were many discussions on the subject of opening the Highway Trust Fund," he said. "They started with framing of the Urban Mass Transit Act back in the early days of the Administration, and the desire there to get a more consistent form of financing for the program."
>
> Out of this and other discussions came revenue sharing proposals, giving local and state jurisdictions more flexibility, which finally culminated in the 1972 Highway Needs study.
>
> In this, said Beggs, "we highlighted the fact that it appeared to us that the highway program was moving off in new directions." The interstate highways [sic] system was nearing

> completion and the Nation was developing an urban character. The urban program was more troublesome, "in terms of defining routes, in terms of getting the clearances to build the new capacity that was needed, and in terms of permitting the local jurisdictions sufficient flexibility to operate."
>
> Out of that study came a counterproposal from OMB and the White House which suggested now was the time to open the Highway Trust Fund so that local officials could opt between public transportation and the highways.
>
> More discussions between Begg's [sic] office and OMB followed, which culminated in a proposal given to Volpe, which he was willing to support earlier this year.
>
> "This was a major decision on his part," said Beggs. "It meant, in effect, that he was going to tell the highway constituency" of this decision. A position paper to that effect was submitted to the House Public Works Committee, which held hearings in February and March. Last month, the subcommittee reported to the full committee and at press time, outlook for a favorable House decision was not very good but in the Senate, it looks more encouraging.
>
> "Like everything else in the Federal Government," said Beggs, "most of the legislative initiatives have a very long history. This one goes back well into the Alan Boyd regime in the Department . . . . Many studies were made then. Alan himself has strong views on this subject. They were passed on to this Administration, and then after a lot of discussions and a lot of policy papers, a number of position papers were put together over the past several years." [MacDonald, Scot, "The Hassle of Being Under Secretary," *Government Executive*, October 1972]

In truth, the Single Urban Fund and the other radical elements of Secretary Volpe's proposal were dead. Elizabeth Parker summarized the problem:

> This treatment of the transit program was viewed as a serious threat by the transit lobby and urban interests, largely because the transit program was so new and because it was felt that a combined program would result in all or more of the money being devoted to highways. At the same time, highway interests did not want any of "their money" to be used for transit. The Urban System program had only been in existence since 1970, so supporters of this program also felt threatened. Deprived of the support of transit groups and facing strong opposition from highway interests, the Nixon administration was unable to make any significant headway in its efforts to increase flexibility in the use of federal highway and transit money. [Parker, p. 57]

In the Senate

The Senate Subcommittee on Roads began hearings on proposed 1972 highway legislation on May 10 and would continue with hearings on seven additional dates through June 15. Many of the witnesses who had testified before the House Subcommittee on Roads appeared before the Senate Subcommittee to repeat their views. However, some new voices were heard.

Senator Bayh, the new chairman, opened the hearing at 10 a.m. After serving in the Indiana House of Representatives (1954-1962), he had won election to the United States Senate in 1962. A well-known liberal, he had been influential in passing Title IX of the Higher Education Act relating to women's equal opportunities in public education. As chairman of the Senate Subcommittee on Constitutional Amendments, Senator Bayh had helped secure adoption of two constitutional amendments, the 25th (1967, on presidential succession and disability) and the 26th (1971, lowering the voting age to 18). He also sponsored the Equal Rights Amendments, which Congress approved in 1972 but it failed to secure ratification by the States. (He would lose his reelection bid in 1980 to State Representative Dan Quayle.)

He opened the hearings by saying that the 1972 legislation "could have major impact on the Nation's entire ground transportation system for decades to come." This was because:

> Serious questions have been raised about the future of our highway program and its role in a coordinated transportation system. These questions need satisfactory answers.
>
> Earlier assumptions about the role, scope and financing of the Federal-aid highway program have been called into question recently.

Everything was on the table, including the role of the automobile, preferential financing for highways through a dedicated trust fund, and how to address the environmental impacts of transportation.

Highways remained the lifelines of the economy and personal mobility. "Over 98 percent of the trips taken by individuals are on highways." The 1972 Highway Needs Report had documented a "huge backlog" of needs that could not be ignored.

While many issues remained open, he had drawn a few fundamental conclusions:

> First, it would be unwise not to complete the Interstate System according to its basic original concept as a national network of interconnected, limited-access highways, with possible exceptions for certain densely populated metropolitan areas.
>
> Second, we should upgrade and in some cases reconstruct many miles of the old primary system which unavoidably has been neglected while the major share of available funds was invested in the interstate.
>
> Third, urban and secondary roads have failed likewise to keep pace with the tremendous increase in vehicle miles traveled and must be improved and modernized.
>
> Fourth, while it may not be in the direct province of this subcommittee, it is essential that much more be done to improve mass transit facilities throughout the country.

> Fifth, as disclosed by a survey conducted last year, there is a critical need for replacing thousands of dangerous, below standard bridges; more than 24,000 such deficient structures are located on Federal-aid systems alone.
> Sixth, sizeable additional funds should be committed to expanding and implementing various highway and vehicle safety programs.
>
> Seventh, whatever answers are provided to the many questions posed as we ponder new highway legislation, those answers must include adequate safeguards for protection of the environment in all areas from metropolitan air quality standards, the preservation of park land, and the protection of national resources.
>
> Eighth, the practice by the last two administrations of withholding from the States sizeable funds authorized, appropriated, and apportioned for highway purposes should be ended.
>
> Ninth and finally, the excessive amount of time and money consumed by administrative delays, paperwork and other "red tape" should be reduced. [*Proposed 1972 Highway Legislation*, Hearings Before the Subcommittee on Roads of the Committee on Public Works, United States Senate, 92nd Congress, 2nd Session, Serial 92-H37, p. 1-4]

Secretary Volpe was the first witness, accompanied by Under Secretary Beggs, Administrator Villarreal, and Deputy Federal Highway Administrator Bartlesmeyer. The Secretary thanked Senator Cooper for introducing the Administration's bill, which "would provide us a mechanism to better meet the pressing problems of urban transportation and achieve sufficient urban mobility through balanced transportation."

He acknowledged the vital role that highways played, but their improvement has "not been carried out without detrimental side effects, primarily in our large metropolitan areas." Part of the problem was that until very recently, "State and local officials had no choice" on urban transportation since funding for mass transit capital improvements was not available. Without investment choice, local officials "have been unable to develop effective multimodal planning capabilities." Review of these problems "leads to one simple conclusion," which he explained:

> We must develop more efficient transportation in our urban areas. At stake is the vitality and quality of life of our urban areas. Now is the time to begin this urgent task.

His "firm belief" was that, "We, in Washington should not make their decisions for the localities, nor should we arbitrarily control their decisions." The local officials who were most familiar with the problems of their localities must have the ability to make those decisions. The Administration's proposals grew from these ideas.

After summarizing the proposals, he said, "I realized that I would not receive unanimous approval for this new approach." He wanted to address some of the concerns, even misinterpretations of the proposal. He said that the first question he is always asked was "how can we propose using Highway Trust Fund moneys for public mass transportation purposes when our highway needs are so great." The 1972 Highway Needs Report should be kept in perspective. It documents the cost of bringing the highway network up to a set standard, not whether doing so would be "worthwhile in an economic or social sense." The standards "might be extremely difficult to implement" on many of the roads, particularly local roads and streets that constituted one-third of the total highway needs.

Another criticism was that "we would be taxing American motorists for uses that are not beneficial to them." He responded that, "Highway investments alone cannot cope with the pressing and severe problem of congestion that is so harmful to the effective functioning of our urban areas. Improvement of highways and mass transit would benefit the users of both. For example, many people who drive their cars in urban areas would prefer to use efficient public transportation service but "it simply does not exist." He said that "it seems to me that the case is very clear that good urban transit investments are strongly and directly beneficial to auto owners and highway users, and that it is in the best interests of all concerned to permit the use of some Highway Trust Fund revenues for these purposes."

Recognizing that his proposal was a "a departure from the past," he was heartened by recent indications that "industries closely associated with highway use and the private automobile are recognizing that our proposals are, indeed, in the best interests of highway users." He said:

> The Mobil Oil Corp. and the Standard Oil Co. of New Jersey are on public record supporting the concept of using Highway Trust Fund money for urban transit investments, and the National Automobile Dealers Association . . . has adopted a resolution explicitly endorsing the Single Urban Fund proposal.

In closing, he said:

> The opportunity which is before you and the committee, Mr. Chairman, to make a permanent and lasting contribution to efficient transportation in this Nation is enormous. The opportunity to represent the best interests of the American people is equally enormous. I recommend the administration's Federal-Aid Highway and Mass Transportation Act of 1972 for your most serious consideration. Knowing this committee, as I indicated earlier, I am sure it will receive a fair hearing. [*Proposed 1972 Highway Legislation*, p. 128-137]

Senator Bayh's first question was about the target date for completing the Interstate System. The Secretary indicated that the target was the end of the decade and that the funds proposed for authorization during that period would accomplish that schedule. Bayh did not question the schedule, but asked "what assurance does this committee have that funds it authorized will actually be released and expended?"

The Secretary replied, "I would not be here today, in making the proposal I have made if I had not received assurance that the funds that we are suggesting for authorization will be expended . . . ." Senator Bayh was skeptical. "I am sure you are as convinced of that as anything, because you are a very honest man." The Secretary had been similarly certain when he testified before the subcommittee about the 1970 reauthorization, but the record of the last 2 years put such assurances in doubt. Volpe replied that "I have assurances, not just Secretary Volpe's best assurance, but

assurance from the Office of Management and Budget, [that the Interstate funds] will be expended," an assurance he did not have 2 years earlier.
Secretary Volpe, in response to the Senator's question about project delays, said that, "I would say to you sincerely that even if we were to make more funds available than we have suggested in the authorizations today, I doubt seriously the Interstate System would be completed much before the end of the decade." Some routes had proven controversial, were tied up in court, and could not be completed before the end of the decade regardless of the money available for their construction.

Senator Bayh asked why the Administration was proposing to take "all mass transit funds . . . from the highway trust fund." The Secretary agreed that would be the case after FY 1974, except for research and development and demonstration programs. He continued:

> I tried in the first instance to get a mass transit trust fund, and we looked very hard and long at the sources of funding for mass transit. Unless you want to tap some other sources, the user charge philosophy just does not work in this situation, because I think you and I recognize that the bulk of the patrons today cannot afford such a tax . . . . The Highway Trust Fund however, [sic] is contributed to by the auto user for whom we are trying to reduce this congestion. [*Proposed 1972 Highway Legislation*, p. 137-142]

Senator Howard H. Baker, Jr. (R-Tn.), who considered mass transit subsidies a "bottomless pit," said "the concept of comity between systems, the concept of compatibility of urban mass transit and the highway system . . . has been made so thoroughly and patently desirable, that you completely shifted the burden, that one system is interrelated with the other." However, if transit was going to be funded out of the Highway Trust Fund, he thought transit users should make some contribution to it "in deference to the concept." Secretary Volpe said he would not only consider it "but we will give it very strong consideration." [*Proposed 1972 Highway Legislation*, p. 147-152]

Senator Randolph asked about the delays in project completion as a result of the "important steps [taken in recent years] to protect the environment as it relates to highway development." He said:

> I believe there must be a better way. There must be a coordinated effort, there has got to be some better plan. Otherwise what you should do in 1 or 2 years, takes 5 or 6 years, and this is not right.
>
> It is not right for the environmentalists, it is not right for the highway which needs to be constructed to serve the people.

He asked Secretary Volpe for suggestions.

New projects, Secretary Volpe said, were being "slowed down to some extent, but the delay is not inordinate" when all parties work together to meet NEPA requirements. With help from the new Assistant Secretary for Environment and Urban Systems, project development time "for clearance of those environmental impact statements has gone from as long as 14, 15 months or more, to 30, 45 days in some cases." The biggest problem was for projects that had been underway for some years. As a result of the retroactive aspect of NEPA, "we have very severe delays because we had to go practically all the way back and start from scratch." He said that they continuously encouraged the State highway departments to follow the requirements and not to try to avoid steps, such as public involvement.

Senator Randolph said that in view of the red tape associated with the Federal-aid highway program, "I wonder if it is not time when the departments themselves at the State level can be granted the authority, once, of course, the Secretary of Transportation determines that the State meets the Federal guidelines, to do this job on their own." Volpe replied that FHWA had "given some latitude to the State highway departments."

Administrator Turner had established a joint AASHO-FHWA Red Tape Committee to try to minimize delays, the results of which were described in a later submission to the subcommittee. Among its accomplishments were establishment of a Directives Clearinghouse to coordinate, review, and clear significant or revised program directives; issuance of the FHWA *Index of Applicable Directives* in November 1970 (updated in February 1972) to simplify, clarify, and consolidate the program directives system; reduced headquarters review of PS&Es; and release of streamlined procedures in Policy and Procedure Memorandum 80-5.2 on "Highway Beautification: Outdoor Advertising."

In response to Senator Randolph's idea of devolution to the States, Secretary Volpe said, "We will, of course, give consideration to the suggestion that you have made, at least as they relate to minor projects which are not controversial. [*Proposed 1972 Highway Legislation*, p. 155-158, information on Red Tape Committee, p. 139-140]

After a discussion of highway safety initiatives, Secretary Volpe concluded his testimony. On June 27, he submitted responses to questions submitted to him for written response. Some of the questions-and-answers follow:
Does the Administration oppose funding mass transit capital improvements at least in part from general fund revenue?

> As a matter of principle, the Administration does not oppose the use of general funds for financing mass transit capital improvements. The issue here is really, program level, rather than source of funds. It is the Administration's position that a program level approximately equal to that which can be sustained by the Highway Trust Fund is enough to meet those highway and transit requirements that are truly pressing.

It there anything improper or illegal about the U.S. Government using a portion of the more than $6 billion now impounded or not released from the Highway Trust Fund for purposes other than those related to Federal-aid highways?

> The question assumes a hypothetical situation which, in reality, will not occur and which will not actually present a problem with respect to the proposal that amounts in the Trust Fund shall be available for mass transit purposes.

> In reality, obligations are incurred under contract authority in advance of the collection of revenues credited to the Trust Fund. The lag between obligations and expenditures can be from one to three years . . . . Thus, unpaid obligations incurred against existing authorizations (1973 and prior years) will substantially exceed the cash balance of the Trust Fund on July 1, 1973, the effective date of the 1972 Act (Administration Bill, S. 3590).

Under the recommended program, does it seem likely that any one metropolitan area could receive Federal funding for mass transit at a level comparable to that which is possible now under current UMTA authorizations?

> Yes. We are convinced that, through the use of the special [discretionary] 20 percent fund for mass transit and the portion of the urban transportation funds allocated to the State, metropolitan areas will be able to meet their mass transit requirements as they may be defined in the future.

Since it is generally agreed that the Interstate System should be completed as soon as possible for highway safety reasons, does not the recommended change in Interstate funding represent a reduced commitment on the part of the Administration to the cause of highway safety?

> No, it does not. As you know, the safety program of the Department comprises many elements, only one of which relates to the completion of the Interstate System, and we have requested increased funding for our activities under both the Highway Safety Act and the National Traffic and Motor Vehicle Safety Act. Our request for funding for completion of the Interstate System represents a level approximately equal to the obligation level currently experienced and, therefore, indicates no reduced commitment in that area . . . .

In view of the provision for time extensions until 1980 for completion of the Interstate System and until 1974 for notification of intent to build alternate segments, why is no similar extension proposed for the 1975 deadline for submission of plans, specifications and estimates?

> Our bill would delete the 1975 PS&E deadline. We recommend this approach specifically because in extending the Interstate completion schedule, PS&E would be required under present legislation more than 5 years in advance of construction for some segments. We believe that it is not realistic to expect that valid plans, specifications and estimates can be developed that far in advance of construction.

In the interest of reducing red tape and speeding up Federal-aid procedures, would it be desirable to simplify existing environmental requirements that must be met before highway projects proceed? Could this be accomplished without regressing from the present national commitment to environmental protection?

> The simplification of environmental requirements administratively is an ongoing effort of the department. The major problem has arisen with projects for which planning had begun before the passage of the National Environmental Policy Act. As you know, a recent study by the General Accounting Office determined that environmental requirements for new

> projects can be taken into account at the beginning of the planning process with minimal delay to highway projects. Legislation to simplify these requirements, therefore, is not needed at this time. [*Proposed 1972 Highway Legislation*, p. 161-167]

Senator Lowell P. Weicker, Jr. (R-Ct.) appeared before the subcommittee on May 11. A former member of the subcommittee, Senator Weicker had submitted a bill on January 19, 1972 (S. 3037), that he wanted to discuss. In a statement submitted for the record, he described the bill:

> If there can be a single phrase to describe S. 3037, it is "planned flexibility." As you well know, DOT administers an incredible mish-mash of Congressionally created transportation programs, making local inter-model [sic] planning and coordination virtually impossible . . . . Mr. Chairman, what I propose is that we mandate completion of the Interstate Highway System, albeit over a somewhat longer period to take into account the environmental, legal and technical problems encountered by several important Interstate sections. I then propose that State and local governments be *permitted* to spend their remaining highway dollars on public transportation, in accordance with the Urban Mass Transit Act. Note that I said "*permitted*." Nowhere do I *require* anyone to spend one dime on mass transit unless the responsible, elected State and/or local officials decide it is best for them.

Before introducing his statement, Senator Weicker had said:

> Somebody in the press asked me the question earlier today, "Is this the year we are going to break the back of the highway lobby?"
>
> I answer that the purpose of my legislation and legislation akin to it is not to break the back of any particular segment of our transportation industry or system here in the United States. What it does is bring about a balance; I realize that we are not going to be able to impose a Connecticut solution to transportation problems on Montana or any other State. What I have tried to do is give the tools or create the tools whereby we can have a balanced system.

Senator Bayh said that when he asked Secretary Volpe why the Administration's proposal did not include a commitment of general fund revenues, "I am not too sure we received an answer to it." He asked Senator Weicker about the intentions of his bill regarding the source of funding for mass transit. Weicker said that his bill assumed continued authorization of general revenue for UMTA outside of the Highway Trust Fund. "I think we have to have that kind of commitment, not just a limited trust fund, but a separate commitment by the Congress to mass transit." [*Proposed 1972 Highway Legislation*, p. 171-173, emphasis in the original.]

On May 18, the subcommittee heard from several environmental organizations. Robert Waldrop, assistant to the Washington representative of the Sierra Club and consultant to Friends of the Earth, said that his statement would "focus on the relationship between our emphasis on automobile transportation and the national energy situation." Over the years, he said, the automobile had replaced more energy efficient modes of transportation, such as buses, despite "our dwindling energy reserves." According to one study, the increasing demand for petroleum would "deplete all possible world reserves in 40 years."

His two organizations believed that "we should begin to change course now while there are still sufficient reserves to permit a less abrupt change." The focus should be on discouraging private automobile use "while promoting more energy-efficient means of transportation, such as buses and trains, [which offer] the best hope and least painful method of conserving the Nation's rapidly diminishing petroleum resources." Bicycling and walking as part of the transportation system also were helpful.

The Volpe proposal was "the important first step." Additional steps were needed to "stimulate increased use of public transit and a reduction in the reliance on the automobile where a more appropriate mode will suffice. Such a shift would reduce air pollution, the destruction of neighborhoods and parklands, urban disintegration, the death and injury toll on the roads, and the mobility problems of the poor, handicapped, elderly and young.

Waldrop's organizations "feel that the once necessary Federal assistance program for highway construction has fulfilled, to a large extent, its purpose." Now, he said, "Similar emphasis should be given to public transportation." They did not advocate termination of all highway programs, since needs in some areas "are still great." However, "in urban areas especially, a concerted program is needed to help establish an adequate public transportation system." [*Proposed 1972 Highway Legislation*, p. 490-492]

Concluding his statement, Waldrop introduced Richard O. Baumbach, Jr., of New Orleans. He and William E. Borah were preparing a book on the controversy over the proposed construction of the Vieux Carré Riverfront Expressway (I-310) along the French Quarter. Baumbach discussed the history of the expressway until Secretary Volpe cancelled it in July 1969, as well as the ongoing efforts to block "construction of a bridge in the highly stable, residential area of uptown New Orleans." Based on his experience and his work, with Borah, representing the Environmental Defense Fund in the effort, he had concluded that for New Orleans, Federal-aid urban highways had not "relieved traffic congestion in our city." In fact, he said, "evidence indicates it has encouraged the suburbanization of both commerce and people."

New Orleans, he said, "had one of the best transit systems in the United States." It ranked second behind New York City in the percentage of people using public transit to get to and from work. It was the only major city to show an increase in ridership since 1940. "Despite the quality of service, the volume of ridership, and a 15-cents fare—lowest in the country—the percentage of people using transit in New Orleans has declined from 63.2 percent in 1957, to 39.5 percent in 1967." The result was that the city's private transit company lost over $8 million in 1969. The company was now seeking a 5 cent fare increase "which evidence elsewhere indicates will cause a decline in ridership and service and a greater reliance on automobiles, highways, and parking lots, thereby compounding center city congestion rather than alleviating it."

In closing, he added:

> Without a balanced approach to transportation planning, without Federal funds made available for alternative forms of mass transit, the central business district will decline, deteriorate and decay, causing irreparable harm and damage to the entire metropolitan area.

> In conclusion, Mr. Borah and I respectfully request that this subcommittee support the use of Highway Trust Funds for alternative forms of mass transportation to preserve the strength and stability of the New Orleans metropolitan area. [*Proposed 1972 Highway Legislation*, p. 492-496]

(The book Baumbach and Borah were working on would become: Baumbach, Richard O., Jr., and Borah, William E., *The Second Battle of New Orleans: A History of the Vieux Carré Riverfront-Expressway Controversy*, The University of Alabama Press, 1981. For more information on the highway struggles in New Orleans, see "The Battles of New Orleans - Vieux Carré Riverfront Expressway (I-310)" at http://www.fhwa.dot.gov/infrastructure/neworleans.cfm.)

Finally, Waldrop introduced Steve Bossi of the National Catholic Rural Life Conference to discuss the rural implications of S. 3590, the Administration's bill. He spoke of the increasing sense of isolation in rural areas because of the "continuing outmigration of rural people with the consequent closing of small town businesses and service agencies [that] have been responsible for leaving our remaining rural residents farther away than ever from jobs, friends, goods and services." Rural transportation problems also affected rural health, income, employment, and housing options.

For these reasons, Bossi said, his conference was "very enthusiastic" about the Rural General Transportation Program, which would allow funds to be used for highways, railroad facilities and rolling stock, and mass transportation facilities and equipment. He favored public transportation systems that would draw rural people together and that would be "more responsive to the real transportation needs and desires of community people." However, many rural groups "have been able to obtain the necessary equipment and facilities but have failed to survive as a system because of an inability to meet the high continuing costs of operation." The costs of management, bookkeeping, maintenance and promotion exhausted resources. "I would suggest, therefore, that the purpose of the proposed rural general transportation program be broadened to provide grant and loan assistance for a variety of purposes related to establishing and maintaining a successful system."

He concluded:

> It is encouraging to witness in this bill the acknowledgement that transportation is as vital to rural communities as it is to our urban centers. The many struggling attempts being made across the country, most of them dependent on second-hand busses [sic] and volunteer drivers, testify to the desperation with which people are attempting to meet this need on their own. We in "Catholic Rural Life" feel that they have a right to look to their Government for assistance in this area and urge you to demonstrate to them your concern." [*Proposed 1972 Highway Legislation*, p. 496-499]

Senator Bayh was puzzled by Baumbach's comments about the public transit system losing money despite increases in ridership. "That seems to be a tough set of circumstances to try to combat." Baumbach replied that the transit company, called New Orleans Public Service, was confined to Orleans Parish and might have increased usage if it could extend its facilities.

The Senator asked if Baumbach meant that "whenever the government builds highways, automatically the use of public transportation falls off." Baumbach said he felt that "if the regional area had committed itself or would commit itself to mass transportation, that commitment would automatically mean the funds would be available to perpetuate this service," but without subsidies, the service, already losing $8 million a year, would run the risk of even bigger losses. He thought that expansion to a regional system accompanied by a decision not to build urban highways along with construction of fringe parking would strengthen the system and enhance the already strong central business district.

In response to a later question from Senator Cooper about how to reduce reliance on the automobile, Baumbach said that New Orleans, following the lead of European cities, had converted two of its streets in the French Quarter to pedestrian malls, "and it has been a tremendous success, so that many of the businessmen who were fearful that it would lead to a decline in the activities in the central business district have been pleasantly surprised." [*Proposed 1972 Highway Legislation*, p. 499-505]

Senator Alan Cranston (D-Ca.) appeared on May 25 in support of the Bicycle Transportation Act that he and Representative Koch had introduced. He recounted the history of the bicycle, including its fading popularity after the turn of the century:

> Today, after several decades of declining popularity, we are witnessing renewed interest in and enthusiasm for the bicycle. Young and old alike are pedaling for pleasure, entering bicycle races, joining bike clubs, and biking to and from work, school and shopping centers. Bicycle manufacturers report dramatic increases in sales, and Government officials have discovered a new citizens' lobby—the bicycle enthusiasts who are demanding bicycle use facilities for safe and pleasant recreation and transportation.

He had been "pleasantly surprised by the enthusiastic, nationwide interest in my bill." He had secured 14 Senate cosponsors, while Representative Koch had lined up 51 House cosponsors. The Department of Transportation had offered favorable views to the subcommittee in a letter dated February 23, 1972, with Secretary Volpe stating that the Department was "excited about bicycles" and was instituting an innovative program to encourage it. Senator Cranston said he agreed with the Department's concern about ensuring safety by emphasizing construction of bicycle lanes, paths, and trails that are separated from automobile lanes. He also had no objection to the Department's recommendation to expand the bill to include trails for hiking and equestrian use and that funds for bicycles be allocated only when an overall plan has been developed for safety and contiguous routes.

Senator Cranston also submitted a statement in support of the Administration bill, saying, "The bill to permit the highway trust fund to be used to construct mass transit systems, I think that is a very, very fine approach to getting mass transit going in our country." [*Proposed 1972 Highway Legislation*, p. 515-519]

Governor Daniel J. Evans, Republican of Washington State, testified next as a representative of the National Governors' Conference. He began by reading a policy statement on the role of each Governor in administering the States' transportation programs:

> He should have the ability to transfer funds among the various programs to meet his State's own priority transportation needs . . . . We call for the creation of a single unified Transportation Trust Fund incorporating existing transportation revenues earmarked for use within a specific mode of transportation or by beginning a phased program of percentage transfers from the highway and aviation trust funds and other funds made available for transportation, into the proposed unified National Transportation Trust Fund. Further, since the Governor is best able to determine the transportation needs and priorities of his State, the distribution of the National Transportation Trust Fund should be allocated through the Governor.

The National Governors' Conference had approved this policy 2 years in a row, but had not yet had a chance to vote on the Administration's proposal.

Governor Evans was supportive of the flexibility provided by Secretary Volpe's recommendations, but had some concerns. First, he was concerned that the plan did not contemplate continuing general Treasury funding for mass transit as at present. Without additional revenue, "we are not likely in my view to have sufficient money to really carry out the concept of flexible transportation funding, and adequately handle the problems of both highway needs and mass transportation needs."

Second, he did not believe that the States were being given a strong enough role in the urban planning process envisioned by the proposal. Its planning requirements represented "a serious erosion of adequate planning coordination" by weakening the State role. "Seldom do the needs of transportation, mass transportation, or highway transportation confine themselves to our urban centers." The State could best provide the broader perspective.

Finally, he recommended action on impoundments and cutbacks that were causing "serious difficulty in planning highway construction." He said:

> The problems of planning on a long-range basis, to provide a steady allocation of construction projects, simply cannot be done with the traditional methods we have used. Cutbacks from the highway trust fund, carried on by several Administrations now over the past 10 years, cannot continue without seriously affecting proper planning.
>
> We at the State level for many, many years have distributed money from our State raised gasoline tax to local communities.
>
> We distribute to counties, we distribute to cities. We do it without an appropriations process at the State level.
>
> We do it on a formula basis.

> The local communities know on a year to year basis what they can depend upon, and it is essentially their money, even though it is raised at the State level, through State taxes, and any changes in those levels must be assumed by the legislative body at the State level.
>
> I frankly cannot understand why Congress and the national administration have been unwilling to assume the same responsibility insofar as our present highway transportation fund is concerned, or . . . any future flexible transportation fund.

His solution, made "in the strongest words possible," was to make funds available to the States or even local communities "without the necessity of appropriation." In this respect, he was favoring contract authority for the funds.

Senator Robert T. Stafford (R-Vt.), who was conducting the hearing, asked Governor Evans whether the Highway Trust Fund could meet highway and mass transit needs. The Governor said he was certain that needs exceeded the amounts available from the Highway Trust Fund and simply broadening it for other transportation purposes "just aggravates that situation." The National Governor's Conference supported its expansion to a Transportation Trust Fund even if additional funds were not available.

"Are you," Senator Stafford asked, "proposing a type of revenue sharing . . . for transportation on a regular basis?" Governor Evans replied, "Yes, indeed I am." He was an "enthusiastic supporter of revenue sharing in general," which was practiced in many States, including Washington, where the State made funds available to local governments. "It is only in the relationship between the Federal Government and the States, that in no area, of which I am aware, has the Federal Government been really willing to share on a formula basis, without yearly appropriations, any major source of revenue." [*Proposed 1972 Highway Legislation*, p. 524-528]

Later on May 25, John W. Vardaman, an attorney with the prestigious Washington law firm of Williams, Connolly, and California, appeared before the committee to address the recommendation of groups such as AASHO and ARBA that project opponents seeking injunctions to halt projects should be required to post bond to protect the government from frivolous lawsuits:

> The bond proposal is not only unnecessary and unwise, but I believe that a realistic examination disclosed that its true purpose is to discourage, if not defeat, the use of injunctive proceedings by private parties to enforce compliance with Federal statutes which implement the national policy of protecting the environment.

Vardaman represented citizen groups in two of the most contentious highway conflicts in the country, both involving construction of an expressway through a public park. One involved construction of I-40 through Overton Park in Memphis and the other called for construction of the U.S. 281 expressway through Brackenridge-Olmos Basin Parklands in San Antonio. Highway officials often selected park locations for their projects to minimize disruption to homes and businesses. Section 4(f) of the 1966 Department of Transportation Act had raised barriers to this concept by imposing barriers to the use of parkland. Senator Ralph Yarborough (D-Tx.) had introduced this provision in response to the State's plan for U.S. 281 in San Antonio. He initially tried to include it in the Federal-Aid Highway Act of 1966, but it had been watered down as new Section 138 of Title 23, United States Code, to call for "cooperation" and "consideration" rather than the prohibition he sought. The Federal-Aid Highway Act of 1968 incorporated the stronger Section 4(f) language into Section 138.

Vardaman put his two cases into perspective:

> The disputes in Memphis and San Antonio brought into sharp focus the conflict between the value and importance of parks and the importance of urban freeways. They also brought into play the implementation and enforcement of Federal laws specifically designed to protect the environment and to require that highway planners take into account the intangible social values represented by parks, recreation areas, and open space.

The "recent success of citizen lawsuits" had brought sharp criticism from the highway agencies and builders and prompted their complaints about "frivolous suits brought by irresponsible environmental advocates," as Vardaman said ARBA had put it. He summarized the Memphis and San Antonio cases "to illustrate the types of areas that form the heart of the citizens lawsuits." He questioned the characterization of such lawsuits as frivolous and the plaintiffs as irresponsible:

> I have found 25 reported cases in which citizens groups have attempted to enjoin construction of Federal-aid highways on the basis of environmental laws. The plaintiffs were successful in 14 of those. Thus the initial point to make is that the plaintiffs have proved to be right more often than not: hardly an indication that the suits are frivolous.
>
> In the 11 cases that the plaintiffs lost, in no case did the court characterize the suit as frivolous or the plaintiffs irresponsible.
>
> Moreover, in none of those cases was there an injunction granted and later dissolved. Thus in those suits which were not meritorious there was no delay of the highway occasioned by the litigation . . . . Thus any delay has not been the result of an order in a frivolous case, but instead in a case in which the court determined that the plaintiffs were right.

In response to a question from Senator Bayh, Vardaman stated that he knew of no case where an injunction had been issued to stop construction "and later dissolved either by the court granting the injunction or by an appellate court." Again in response to a question, he said that he did not know of any case where the plaintiffs were using the environmental statutes to pursue purely private business interests.

Vardaman said "it is inappropriate" to suggest that citizens filing lawsuits were responsible for delaying highway construction:

> Where there is a delay, it is as a result of a Federal judge having heard the evidence from both sides and found either that the plaintiffs are likely to prevail, in the case of a preliminary injunction, or, in the case of a permanent injunction, that there has been a violation of Federal law . . . . If the blame for the delay of the highway construction is to be

> laid to one of the parties to the law suit, then it seems to me more appropriately laid at the feet of those who have been found not to have complied with federal law rather than those who have brought the law suits to seek compliance.

As a result, a new law requiring the posting of a bond was not necessary. Further, the Federal Rules of Civil Procedure allow a judge the discretion to impose a bond whenever a preliminary injunction is issued by a district court. A court of appeals also may require a bond. "It would be unwise to interfere with the operation of the rule adopted by the courts with the approval of the Congress that leaves to the discretion of the court the amount of the bond."

Vardaman also was concerned about the effect of a bond requirement on potential plaintiffs:

> Moreover, if the law required a bond which in any way approximated the dollar amount of the highway project at issue, the plaintiffs would in almost every case be without a remedy, even though the court might be satisfied that they had proved a violation of Federal law.

He also questioned AASHO's assertion that a bond was necessary to show the plaintiffs' sincerity of purpose and responsibility of action. "The undertaking of litigation against a Federal-aid highway requires substantial financial burdens which are wholly sufficient in and of themselves to deter any person or organization that is not serious."

In exchanges with Senator Bayh, Vardaman said that while he thought Section 4(f) could be broadened to protect other resources, "it might be a mistake" to make any drastic changes until the courts had a chance to rule on the current law. In 2 years, "if there is substantial uncertainty over the meaning of some of these statutes," legislative changes might be appropriate. Regarding the routing of highways through parks or homes, he said that each case had been looked at individually, keeping in mind that relocation benefits were not available for the homeowners but "Congress cannot . . . enact a statute which recreates the forest in the Memphis park or in any other park which would be taken away by a highway." He concluded his testimony on this point:

> Ultimately it is a question of balancing values, but I think once the decision has been made to put a highway through an urban area, which you must recognize is an extraordinary [sic] disruptive influence, in the cases I have seen, I think that the public interest would be served by not going through the park, but taking an alternative even though it results in some additional housing dislocation. [*Proposed 1972 Highway Legislation*, p. 596-607]

(The Memphis and San Antonio cases that Vardaman discussed were significant milestones in application of Federal environmental requirements. Section 4(f), which was introduced in response to the San Antonio case, remains a strong protection for publicly owned land in parks, recreation areas, and wildlife and waterfowl refuges, as well as historic sites of national, State or local significance. Ruling in the Memphis case on March 3, 1971, the Supreme Court found Section 4(f) to be "a plain and explicit bar to the use of federal funds for construction of highways through parks—only the most unusual situations are exempted." The ruling returned the case to the District Court where a settlement was reached that protected Overton Park by rerouting I-40 along the northern Memphis beltline. This ruling proved to be a landmark in application of Section 4(f) to Federal-aid projects to this day.

The Highway Action Coalition appeared before the subcommittee on May 26. Kramer was joined by Stewart L. Udall, Secretary of the Interior throughout the Kennedy and Johnson Administrations, who was a codirector of the coalition, and John Winder of the National Air Resources Commission, Tuberculosis and Respiratory Diseases Association. Secretary Udall had a longstanding reputation for environmental concerns. Traveling around the country, he had seen that "the environmental revolution is real, values are changing." As part of this evolution, he had observed "a revolt against the automobile." He said:

> I sense a growing awareness of the fact that the automobile is the most destructive single force in this country. The automobile's impact on human health, air and land pollution, and the slicing up of the cities are leading to highway disputes in almost every major city of this country.
>
> Roadbuilding, which 30 years ago was a universally applauded activity, is now being questioned. I am confident that opposition to continued highway construction is building up; it will not go away.

He recalled being in the U.S. House of Representatives (D-Az.) in 1956 and voting for the Federal-Aid Highway Act that launched the Interstate construction program. "I have had a lot of second thoughts since then." He concluded that "what we needed in 1956 was a national, balanced transportation policy." He continued:

> Instead, we opted in a very single-minded way for the automobile. We are now paying a price; just as we opted for housing programs, instead of programs to build communities; just as we opted for conservation programs, instead of total environmental programs.
>
> As a result of that decision, we let the railroads go down the drain, unlike Canada and many European countries.
>
> We allowed our public transportation systems to die a slow death. We saturated our cities with automobiles. We have been pursuing the twisted logic of more automobiles and more and more roads.

He said he had written an article for a national magazine about the relationship between transportation and the national energy crisis:

> We are very close, in my judgment, to a crunch. That is where I get off, in terms of these 20-year projections for both automobile and oil consumption.
>
> Many planners tell us that we are going to have to have two interstate highway systems, that we are going to have to spend three, four, five times as much on automobile transportation.

This country was going to "have to unhook" from the automobile. He saw an energy crisis on the horizon. Already, oil production in the United States had peaked about 18 months earlier and would continue to decline even as "we are going to have twice as many automobiles in the next 20 years, and two interstate systems on a curve like that." The United States would have to import 60 percent of our oil by 1982, much of it from the Middle East. Although, he said, the "Arab countries are moving very aggressively toward nationalizing oil as recent events in Iraq demonstrate only too clearly." The price of oil was "going to accelerate very rapidly" and the country was "moving into a whole new ball game."

Udall told the subcommittee that reviving public transportation systems was vital, whether it meant new subways, buses, even the return of the trolley. Putting the bicycle back to work was more important than building "some of these freeways that are being fought all over the country." His proposals did not mean the country had to "shutdown or throttle back an industry." Mass transit systems and the vehicles on them would have to be built. "If you build air cushion trains, for example, from Washington to Boston, you have a lot of construction activity."

He concluded his remarks by saying that, "The automobile-highway complex is perhaps the most important environmental problem before us." The time, he said, "for dramatic change in this important area is upon us. We have no alternative." [*Proposed 1972 Highway Legislation*, p. 701-704]

(The article by former Secretary Udall was "The Last Traffic Jam," which appeared in the October 1972 issue of *The Atlantic Monthly*. It elaborated on Secretary Udall's concerns about the pending energy crisis at a time when increased consumption by America's automobiles was predicted. "A limit on the automobile population of the United States would be the best of news for our cities." What was needed was a "necessary shift in public policy toward effective mass transit systems" and a commitment by Detroit to "developing external combustion engines (like the steam engine)" that would deliver travel twice as far on smaller horsepower and less gasoline. The choice, the article stated, was not between growth and stagnation, "but between short-term growth and long-term disaster.")

Kramer then addressed the subcommittee. His views, of course, were similar to those he expressed before the House Subcommittee on Roads, but he now had the chance to react to Secretary Volpe's proposal. He said that the coalition wholeheartedly endorsed the "central notion" behind S. 3590, namely "the use of highway trust revenues for public transportation on a local option basis." He added:

> We are, however, dismayed by the fact that S. 3590 would still earmark more than twice as much money for highway programs as for local option programs under the proposed "single urban fund." We are also uncomfortable with the implication that the highway trust fund will be extended into the 1980's.

The Single Urban Fund also was underfunded, and might result in some of the largest cities receiving less money for transit than under existing programs. The coalition recommended "either that more money be added to the single urban fund (perhaps out of general revenues) or that the urban mass transportation program be continued as anticipated by the original act."

He was concerned, too, that S. 3590 "specifically rules out Federal assistance to help cover transit operating costs." With at least 20 transit systems near bankruptcy and 18 more considering fare increases, "this stipulation is very unwise."

As for the Interstate System, it should be thoroughly reviewed and, if so determined, substantial segments should be eliminated. He said segments in at least 20 major cities were targets for elimination and cited the Embarcadero Freeway in San Francisco as "surely a monument to the futility of urban freeway building." He explained that, "We believe that many of these undesirable projects would never have been advanced were it not for the ready availability of the Interstate System's '10-cent dollars.'" He recommended that cities be given the option of using their 90-10 Interstate funds for transit "if upon close examination, it turns out that the city's public transportation needs are more pressing than its interstate highway needs."

Since no program "impinges more on the quality of our natural and social environment than does the highway program," Kramer strongly endorsed the environmental safeguards of Section 4(f) and NEPA. The recommendation that citizens should be required "to place multimillion dollar bonds before they can bring suit" should be rejected in favor of a requirement that attorney's fees and court costs should be paid if citizens successfully block highway projects. [*Proposed 1972 Highway Legislation*, p. 704-709]

Senator Bayh asked if the subcommittee should put a general transportation policy "high up the list?" Secretary Udall replied, "I think you are putting your finger on the big issue that is all-to-frequently [sic] tabled." Piecemeal policy changes were not going to address the larger questions before Congress. He preferred what he called "the most radical proposal, and the most creative that this coalition is putting forward," which was giving cities the option of using money to build and operate public transportation systems instead of Interstate highways. "This step alone would go a long way toward reducing the number of automobiles, reducing the cost of transportation and reducing air, noise, and land pollution." Congress must, he said, face "the big problem: The need for a single, comprehensive, national transportation policy."

As for addressing congestion, Kramer said that "we have come to the conclusion that new highways, particularly in urban areas, will only generate new traffic and make congestion problems yet more serious." Today's highway users would be better served by investing in other modes, although the mix would vary from region to region.

Senator Bayh asked what could be done to change the habits and life style of people regarding transportation. Secretary Udall said that was "another very big and very basic question." He thought that "the present juggernaut under which we are operating conspires against new life styles." People wanted a new, simpler life, but "the system we have now conspires against it."

As with other witnesses, Senator Bayh asked whether the Highway Trust Fund revenues were sufficient to meet transportation needs as proposed by the Administration. The question, Kramer replied, of whether to use Highway Trust Fund revenues for other modes is a red herring. True, highway user taxes paid for highways, "yet most of the external social, economic, and a lot of the environmental costs are borne elsewhere." No matter the source of revenue, "transportation is a single entity." Clearly, highway user revenue is not enough; other revenue from general sources is needed. [*Proposed 1972 Highway Legislation*, p. 710-715]

On June 6, Administrator Turner appeared before the subcommittee. His prepared statement was primarily a summary of FHWA's May 1972 Stewardship Report on implementation of the 1970 Act, which he said had "called for many fundamental modifications to the basic set of Federal-aid highway laws, the need for which had been demonstrated by changing national transportation demands and public expectations." The ability to make such adjustments had "historically been a hallmark of the Federal aid highway program, and one of the basic reasons for its success over the years." He said that it would be difficult to imagine "operating under the details of 1921's legislative directives," and in that spirit of recognizing the need for change and increased flexibility, the Administration had submitted the Federal Aid Highway and Mass Transportation Act of 1972.

Among his updates, Turner said that on April 11, 1972, FHWA had approved the Federal-aid urban system, totaling nearly 11,000 miles in 218 urbanized areas. Although the 1970 Act focused attention on bus transit road improvement projects in urbanized areas, "the position of public transit in 1972 is still deteriorating." Several successful exclusive or preferential bus highway projects had been implemented, but "even greater emphasis on bus transit improvements as an integral element of the Federal-aid highway program will be needed to achieve measurable improvements in the overall health of our transit industry." Turner said that, "Acting alone, neither industry will do an adequate job."

In cooperation with other Modal Administrations in the Department of Transportation, FHWA had "moved administratively to strengthen the [transportation planning] process through a more effective certification process, intermodal work program requirements, and improved coordination of field and headquarters planning staff." Increased funding for planning remained a critical need.

Turner did not comment on several other aspects of the Stewardship Report, including Section 124 of the 1970 Act on "Elimination of Segments of Interstate System Not to be Constructed." The report stated:

> It is anticipated that on July 1, 1973, the highway departments will have underway, on a schedule to match fund availability, the plans, specifications, and estimates for all remaining segments of the System, and that the intent of the Congress will be met if on July 1, 1975, the highway departments will have submitted PS&E for projects which will utilize all funds released for obligation through that date.
>
> A significant number of projects has been delayed because of litigation proceedings and location problems, many of which have to do with environmental considerations. At the present time, it appears that some 28 route segments totaling approximately 190 miles are in a questionable status regarding the legislative deadlines. Some States are considering substitutions on segments either on a one-for-one basis or by use of the balance of the 200

> miles authorized under the Howard-Cramer Act. [*Stewardship Report on Administration of the Federal-Aid Highway Program 1972*, Federal Highway Administration, May 1972, p. 19-20]

The Stewardship Report also commented on Section 144 of the 1970 Act calling for a study of the relationship of highway construction to transportation services. FHWA took the lead in this study but worked with UMTA, the Office of the Secretary, and several urban transportation planning consultants, as well as the American Transit Association, AASHO, and OMB. The Secretary transmitted the report to Congress in April 1972. The key finding was:

> The transit study indicated that during the next 20 years there would be approximately $6 billion in highway related public transportation needs in urban areas of over 50,000 population. This figure reflects the assumption that planned new rail systems in 7 cities (Atlanta, Baltimore, Buffalo, Los Angeles, Miami, Minneapolis, and Pittsburg [sic]) would be constructed. Approximately 60 percent of the total estimated costs were for busway-type facilities, with 30 percent for fringe parking and terminal facilities, and 10 percent for operation or traffic engineering needs. Approximately 55 percent of all needs are located in urbanized areas over 2 million population, 44 percent for areas between 500,000 and 2 million population, and the remaining 1 percent in those areas between 50,000 and 500,000 population. These projects are expected to eliminate the requirement for approximately 670 miles of new highways at an overall cost of about $6.5 billion.
>
> The study also pointed out the problem of funding projects not on specific Federal-aid systems, and the need for additional financial assistance to cover operating costs of the improved level of transit necessary to realize [sic] the full benefits of the highway improvement. [*Stewardship Report, 1972*, p. 40-41]

When Turner completed his summary, Senator Bayh asked about the impact of environmental requirements on the program. "One of the major criticisms that has been directed at the highway program is its impact on the environment." He asked how "to crank the public opinion of those who are going to be most directly affected by the highways into the planning at an earlier stage?" Turner agreed about the importance of public involvement. "To the extent that it can be done profitably, I think that we have the means, and are following not only the instructions, but the objective and intent of getting citizen participation." Much of the criticism about citizen involvement occurs when officials gather all the facts and listen to all the views but "the final decision may not be the one that the critic wanted. In other words, he disagrees with the umpire's decision."

To what extent, Senator Bayh asked, would Turner characterize the resulting lawsuits as nuisances rather than legitimate suits? Turner replied that out of about 60 suits filed thus far, "I would say not more than eight or 10 . . . are in the category of just plain nuisance suits." He continued:

> Some of these I suspect from the looks of them, are classroom exercises. The filing of a suit is taken on as sort of a classroom exercise, and I think it has no more merit than that. In fact

> in those cases, the suit has been dismissed when it got to the judge, or we have won the case, [so] I think it is a pretty clear indication it was a harassment.

The other suits generally challenged the procedures followed. Lawsuits attempting to block a project are typically filed under the provisions of the Administrative Practices Act claiming that State and Federal officials did not follow the requirements of NEPA:

> They complain about the lack of consideration for environment, failure to hold public hearings, a breakdown in the planning process, inadequate consideration or attention to relocation provisions, and things of that nature, and in most of the cases, they are the same.
>
> They look as though they have been filed from a mimeograph checkoff sheet and just fill in the blanks, because they generally charge failure of everything in the basic legislation in the hopes that perhaps you will hit on one if you cannot hit on another one . . . .
>
> Insofar as suits are concerned, there so far have been no suits with a decision that says a project was environmentally damaging, and, therefore, the project should not be cancelled for that reason. Most of the decisions so far have been procedural, rather than on the merits of the case.

Should those filing suits be required to post a bond, Senator Bayh asked. Turner believed that a person or group delaying a project "should be made to bear some responsibility for his actions," but he wasn't sure how to do so.

Senator Bayh observed that, "it is conceivable that one of good faith could be just as responsible for wanting the highway stopped for a good reason as the ones wanting to build it." Turner conceded the point:

> What I believe is that there are some of these that are not really in that category. I think there are cases that are put up purely for the purpose of harassment and delay, and, again, the individual is not satisfied with the decision, so he wants to appeal and delay it in order to try to force an acceptance of their particular point of view, but after all, somebody has to decide, somebody has to be the referee, and somebody has to be the fall guy that makes the decision.

Admittedly, he said, State and Federal officials "do make some mistakes," but "there has to be some presumption that the Highway Department and the Federal Highway Administration are acting responsibly and in the public interest."

For the record, Turner submitted a commentary on "Highway Delays Caused by Litigation." He identified:

> Location cases to enjoin construction filed on environmental and social grounds, 84; open cases, 60; closed cases, 24. Projects enjoined, 16; injunctions denied, 30.
> District Court action: Suits dismissed, 35; judgment for plaintiff, 7.

> Appellate action on suits dismissed in District Court: Appeals 29; affirmed, 12; pending 10; reversed, 7.

The earliest litigation listed was D.C. Federal Civic Association v. Thomas F. Airis, filed in December 1966 alleging violation of the D.C. Code in development of the Three Sisters Bridge, part of I-266 across the Potomac River between Virginia and the District of Columbia. In all, 14 lawsuits had been filed from 1966 to 1970. The bulk of suits had been filed beginning in 1970, the most recent being Chavez v. Volpe filed June 1, 1972, involving I-40 in New Mexico.

Some of the more substantial delays involved the Three Sisters Bridge on I-266 in Washington (5 years), the North Expressway in San Antonio (5 years), and I-40 through Overton Park (2 ½ years). The statement indicated that the "prime example of a 'phony' environmental suit" involved I-95 around Fayetteville, North Carolina:

> The action to block the construction of I-95 around Fayetteville was filed in June 1968 by a small group of businessmen who now enjoy a competitive advantage because of a break in I-95. Because of this break, traffic must leave I-95 and proceed down U.S. 301 past the plaintiffs' businesses in Fayetteville. The suit has preserved this competitive advantage since 1968. Although the U.S. District Court dismissed the suit in September 1971, finding no violations of social, environmental or other laws, plaintiffs have appealed this suit to the Court of Appeals in order to preserve their competitive advantage as long as possible.

He cited several other suits that he said also were using complaints about social or environmental violations to protect personal or business interests.
Turning to mass transit, Senator Bayh wondered if the proposed Single Urban Fund provided enough funding to meet needs. "It seems to me we are liable to end up with two undernourished children." Turner agreed that the proposal did not provide "adequate funding in total for either of the programs." He added:

> The basic question is how much of our resources can we apply to this set of immediate problems, and at the same time stretch them over a thousand other needs nationally, and these are the amounts the administration has decided to assign to a combination of transit and highway needs.
>
> I do not think there is any indication that this is supposed to be all that is needed.

Senator Bayh suggested that revenue from some other source might be added so that highways or transit would not be approved at the expense of the other. Turner explained that, "You would have to have a substantial increase in both of the funds, and the combined amount that is available here is nowhere near enough." Whether the Highway Trust Fund covered one or both or whether additional revenue comes from another source "would be a policy question." The Administration proposal was never intended to cover every need.

He said needs only on the Federal-aid highway systems totaled $360 billion over 18 years (plus needs of $240 to $250 billion off the systems). "These are not wish lists. They are actually carefully determined needs." In addition, he pointed out that mass transit needs were around $60 to $65 billion. The Highway Trust Fund clearly could not cover all needs, nor did the Administration think that its proposal would do so. "Whether or not there are resources available to double that amount that is being proposed here is another question. The administration has said there is not that amount of money."

Senator Bayh and Turner concluded the testimony with a discussion of highway safety. However, Turner subsequently submitted written responses to a set of questions. One question was whether FHWA review procedures caused undue delay on State highway projects. Turner pointed out that most procedural requirements were added because of legislative requirements. "Of the 23 major actions required by a State highway department to construct a Federal-aid highway project, only four of these requirements have been administratively imposed, and these four actions are tied directly to legislative requirements." The principal delays were caused "by having to comment, argue, and justify actions or proposals to some agency or group outside the highway program area."

Another question was how much reduction in review time could be achieved if procedures similar to those under the Secondary Road Plan were extended to other Federal-aid projects. Turner explained that the Secondary Road Plan made the State highway agency the agent of the Secretary of Transportation in carrying out Federal requirements. The change eliminated FHWA reviews, but the States still had to comply with all requirements. Since Federal-aid secondary projects usually were relatively minor, this procedure saved time since major delays were unlikely in any event. For larger projects, he said, "extending these procedures to other programs, could do no more than reduce the FHWA review time by a few days. The major time requirements would still remain." [*Proposed 1972 Highway Legislation*, p. 897-914]

While Turner was on Capitol Hill on June 6, Secretary Volpe was in Salt Lake City for a speech to the Western Association of State Highway Officials (WASHO), a regional division of AASHO. He assured his audience of his "allegiance to highway transportation and my deep respect for State highway officials." He added, "I have unshakable faith in this industry's ability to be just as competent, just as responsive, and just as devoted, in meeting the future transportation needs of this Nation."

At the same time, he said, those needs were unquestionably changing:

> And I submit that as we live in times of change, we must be the architects of that change or we will most certainly be its victims.

Volpe often used this line in his speeches. Here, it led him to this admission:

> Now I'll admit that in recent months I've had highway contractors, and even a State highway director or two, come up to me and say "Are you the same John Volpe who used to be President of the AGC?" or "Are you the same fellow who was in on the start of the Interstate System back in '56?"

> The answer, of course, has to be a double one. I'm the same guy insofar as I know that America needs mobility – the best brand of mobility it can imagine and afford.
>
> But on the other hand, having sat where I've been sitting for the past three years – getting the overview – I've changed in that I know that no one mode of transportation alone will ever solve all our transportation problems. Urbanization, environmental protection, safety, and other social concerns have introduced a new era – a new set of challenges – for the highway builder. And I know that you are up to meeting those challenges . . . .
>
> I am occasionally asked just what our national highway policy is. And my answer is brief: we don't have one. What we have is a National Transportation Policy.

He discussed highway-related transit solutions and described the Administration's transportation proposal:

> The primary goal of this legislation is flexibility – the ability to have money follow the priorities rather than vice versa . . . . Let me emphasize this point as heavily as I can: If a State – or urban area – wants to spend every last nickel of its money from the Urban Fund for highways – well, you go right ahead and do it! If you want to set aside five percent, or 10 percent to solve a particular congestion problem in a metropolitan area – go right ahead and do that! The decision won't be made for you in Washington!
>
> This is not a program to promote mass transit, or railroads, or Tracked Air Cushion Vehicles [that could ride on compressed air over tracks at 350 miles an hour], or highways. It is a program to promote the very best transportation possible.

He concluded by asking WASHO members to apply their "efficiency and talent" to provide "a new measure of mobility to all Americans."

End of an Era—A Legend Steps Down

Administrator Frank Turner, throughout his tenure, had been moderate in his response to critics, always focusing on the value of buses, downplaying rail transit, and emphasizing the environmental and social benefits of highway development. This approach was reflected in his comments on June 6 before Senator Bayh's Subcommittee on Roads, a familiar forum he had appeared in many times since his arrival in Washington in the 1950s.

However, on May 31, 1972, he had taken a more personal approach, using a friendly forum to lash out at the critics. Speaking to HUFSAM at the Sheraton Hilton in Washington, Turner gave a speech titled "Solutions Must be Based on Facts." The best way to approach transportation, he said, is to "first clearly define the problem, and then bring to bear in its solution all of the factual information available about it, to be analyzed objectively in reaching a conclusion." That, he said, "is the method we must <u>always</u> use." He continued:

> However, today, there are many who, although they do not have the needed essential training in transportation, are trying, nevertheless, to advance solutions to our transportation

> problem – developed from hunch, emotion, or incorrect facts arranged to fit pre-conceived conclusions. These include some sincere, misinformed persons, along with the zealots and dilettantes who regularly are opposed to anything for any reason, or even no reason at all.

He cited some of the statements HUFSAM and FHWA had classified as myths, and then provided the responses the organizations had been promoting for the past year:

- Ban the automobile from the city? "The fact is, if we ban the automobile from all of downtown, then downtown is going to be dead."
- Highways and the automobile cause urban sprawl? "The fact is that the automobile didn't *cause* people to move from the center city . . . it enabled them to."
- Stop building urban freeways? "The fact is that . . . highways will continue for as far as we can see into the future to serve as the principal or sole means of transportation . . . ."
- Cities enmeshed in hopeless traffic jams? "The fact is that, generally speaking, except for the morning and afternoon rush hour there is no real problem . . . ."
- Paving over our cities? "The fact is that as much area was used in cities for horses and wagons and buggies in pre-automobile days as is being used today."
- Consuming too much land? "The fact is that a 300-foot highway right of way stretching 225 miles between Washington and New York City . . . would require about 9,000 acres. Dulles Airport contains about this same acreage."

And so on. As these examples demonstrated, without facts, "we would find ourselves in a hopeless maze, with no way of finding the solid solutions that are needed to our transportation problems." He admonished his listeners "to be as insistent on using only the facts as we would have the opponents do." If they do so, "the conclusion – whatever it may turn out to be – will be a sound and valid one."

Turner had often offered similar views and his audience probably was familiar with them, but on this occasion, he knew something his listeners did not. He planned to retire at the end of June. Turner, 63 years old, informed President Nixon and Secretary Volpe of the decision in letters dated June 21. He told the President that, "I desire to avail myself of the provisions of the Civil Service Retirement Act, with its special benefits available to June 30." He took pride in his long service. "It is with regret that I now take leave of the finest organization and most dedicated group of coworkers in Government, but with the knowledge that each member of the Federal Highway Administration family will continue to render loyal and able service through the Department of Transportation to their fellow citizens."

He told Secretary Volpe that the decision was not an easy one. "It is only that continuing trouble with diminishing vision in my right eye and medical advice relative to that condition causes me to now make this difficult decision." He did not say so, but another factor was his wife Mable's deteriorating mental condition, characterized by confusion and anxiety, that would require an increasing amount of his time. He felt he could no longer leave her alone in their home in Arlington, Virginia, when his job called for him to travel out of the Washington area. [Swift, Earl, *The Big Roads: The Untold Story of the Engineers, Visionaries, and Trailblazers Who Created the American Superhighways*, Houghton Mifflin Harcourt, 2011, p. 304-305]

The President accepted Turner's resignation in a letter dated July 1, 1972. He said:

> A career of public service that spans more than forty-three years is, in itself, a remarkable accomplishment. But your career has spanned more than years; it has helped bring to this nation an incomparable interstate highway system that continues to play a vital role in our development and prosperity.
>
> As an architect of the interstate system, you should feel a very special sense of pride in the fact that this, the largest public works program in world history, has been administered with uncompromising integrity and steadfast dedication to public trust.

Turner, in closing his career, addressed a letter to his FHWA family. Trying to find the words to say goodbye after 43 years "has been a most difficult task." While many government agencies are "impersonal machines," he always thought of his FHWA colleagues "as individuals who were dedicated to doing a piece of the public business more as a service to your friends and neighbors than merely as a source of employment." He could not respond to all the letters and notes he'd received, but his letter was his way of saying "my thanks to all of you for your letters, your gifts, your expressions of good wishes, and many other nice things: but most of all for the fine performance you have turned in day by day as members of the FHWA team." ["Mr. Turner Bids Farewell," *FHWA News*, October 27, 1972, p. 1-2]

Secretary Volpe designated Deputy Federal Highway Administrator Ralph R. Bartelsmeyer to serve as Acting Administrator. Born in 1909 in Hoyleton, Illinois, Bartelsmeyer received his civil engineering degree in 1932 from the University of Illinois at Urbana. He began in 1931 as a Highway Engineer with the Illinois Division of Highways, remaining with the division until 1963 except for a brief period with the Marquette Cement Manufacturing Company (1946-1948). Returning to public service, he worked his way up to Chief Engineer of the Illinois Division of Highways in 1953 and remained in that position until 1963. He served as president of AASHO in 1959 and ARBA in 1961-1962.

After leaving State service, he became vice president of the engineering firm H. W. Lochner, Inc., in Chicago before being appointed Director of the BPR in May 1969. When BPR was eliminated as an administrative office within FHWA, he became Deputy Administrator in August 1970.

On June 6, 1972, when Turner was testifying before the Senate Subcommittee on Roads and Secretary Volpe was delivering his speech to WASHO, Bartelsmeyer also was in Salt Lake City for the WASHO meeting. His speech was titled "There is No Turning Back!" He addressed two important topics, the first being a summary of the proposed Federal-Aid Highway and Mass Transportation Act of 1972. After describing its provisions, he told the western highway officials that "I want to emphasize to you more forcefully that there is no intention to deemphasize the highway transportation program." The country would continue to need highways "as far into the future as anyone now can foresee—good highways—both expanded existing highways and new highways."

The other important topic was consideration of environmental issues:

> Let's be candid—and honest with ourselves—environmental impact statements are now a way of life for State highway departments—and they are here to stay . . . . And there are compelling reasons why we should do a good job in this area. For one thing, we can avoid a lot of litigation, and the resulting headaches if we do.

He characterized highway opponents as falling into three categories: those who have valid reasons for opposing a project, those who are "sincerely motivated but who are misinformed or misguided," and "the zealots or dilettantes who would blindly oppose highways on any grounds, and so choose the environment as a handy battleground." He said:

> Let's not make things easier for the zealots and the dilettantes by not doing our homework on environmental impact statements—by failing to file them or by doing them carelessly. We can save ourselves a lot of trouble, and time, by preparing them thoroughly and properly to begin with.

He estimated that in 1972, FHWA would process approximately 800 final environmental impact statements and 150 Section 4(f) statements. Those numbers were "vastly more than any other individual agency of the Federal Government." He told the audience: "Committed? You bet we're committed!"

Although the States were doing a good job, Bartelsmeyer identified several areas of weakness:

> These include noise and air pollution and the alternatives to the proposed action. In particular, all alternatives must be discussed in the environmental impact statement in sufficient detail to identify the probable beneficial and adverse effects. In addition, greater attention must be given to considering all reasonable alternatives to the proposed highway improvements.

He urged early consultation with State and local agencies such as departments of natural resources, parks, and health.

His comments reflected the evolving attitude of highway officials since enactment of NEPA. Many State highway officials saw critics as "zealots and dilettantes" who simply did not understand the benefits the community would receive from its highways. Their complaints could best be addressed by improved public relations initiatives to get the public on the side of highway development. Environmental reviews under NEPA, which highway officials considered unnecessary, could be done just well enough to meet requirements in minimal time.

Frank Turner and other FHWA officials, who may have shared the States' views, frequently made clear that as Bartelsmeyer put it, "Concern with environmental protection is here to stay." FHWA was committed to working with State highway officials to ensure the NEPA reviews were in full compliance with the law. He recognized that State highway officials experienced "a sense of frustration" and "an occasional wish that we could return to 'the good old days.'" Bartelsmeyer told WASHO:

> But there is no turning back for any of us—and I truly don't believe that any of us would really prefer the old days to the inspiring challenge of the dynamic Federal-State highway program we all are a part of now . . . .
>
> The die is cast. It is not a case of either/or. We will meet our commitment to providing the modern system of highways so essential to this Nation's well-being—while at the same time we will preserve the environment and protect the ecology.
>
> And we will do so not only because it is the law of the land—we will do so because it is right!

Bartelsmeyer would serve as Acting Federal Highway Administrator until June 1, 1973, making his tenure as Acting Administrator the longest in FHWA history.

Party Platforms

With the presidential campaigns underway, the Democratic and Republican parties held their national conventions that summer. Although the Vietnam War and the economy were among the most important issues, both parties adopted positions on many issues that would not be part of the ongoing election debate.

On July 10, 1972, the Democrats adopted a platform that said the automobile "has made a major contribution to economic growth and prosperity in this century," but the time had come for "better balanced transportation—more of it public." The fact that "15 times as much federal aid goes to highways as to mass transit . . . must change." The need for improved rural transportation must not be forgotten. The Democratic Party pledged:

> To create a single Transportation Trust Fund, to replace the Highway Trust Fund, with such additional funds as necessary to meet our transportation crisis substantially from federal resources. This fund will allocate monies for capital projects on a regional basis, permitting each region to determine its own needs under guidelines that will ensure a balanced transportation system and adequate funding of mass transit facilities.
>
> Moreover, we will:
>
> Assist local transit systems to meet their capital operating needs;
>
> End the deterioration of rail and rural transportation and promote a flexible rural transportation system based on local, state and regional needs;
>
> Take steps to meet the particular transportation problems of the elderly, the handicapped and others with special needs; and
>
> Assist development of airport terminals, facilities and access to them, with due regard to impact on environment and community

The Democrats nominated Senator George McGovern of South Dakota, the anti-war candidate, and his running mate, Senator Thomas F. Eagleton of Missouri. On August 1, Senator McGovern replaced Senator Eagleton on the Democratic ticket following revelations that he had been treated for physical and nervous exhaustion on several occasions and suffered from depression. In his place, Senator McGovern chose a brother-in-law of President Kennedy, Sargent Shriver, who had served in posts during the Kennedy and Johnson Administrations.

The Republican Party platform, adopted on August 21, 1972, reflected the views and accomplishments of the President and was dominated by international affairs, especially the goal of ending the Vietnam War. On the domestic front, the platform supported the President's General Revenue Sharing initiative:

> We hold that government planners should be guided by the people through their locally elected representatives. We believe that real solutions require the full participation of the private sector.
>
> To help ease the fiscal crises of State, county and municipal governments, we pledge increased Federal assistance—assistance we have more than doubled in the past four years. And . . . we remain committed to General Revenue Sharing, which could reduce the oppressive property tax.
>
> Our proposals for Special Revenue Sharing for Urban Development, transportation, manpower and law enforcement—all still bottled up by the opposition Congress—are designed to make our towns and cities places where Americans can once again live and work without physical or environmental hazard. Urban areas are already benefiting from major funding increases which we fought for in the Law Enforcement Assistance Administration programs and in our $10 billion mass transit program.

As for transportation, the platform stated that when President Nixon took office in 1969, "a crisis in transportation was imminent," based on "declining mass transportation service, mounting highway deaths, congested urban streets, long delays at airports and airport terminals, deterioration of passenger train service, and a dwindling Merchant Marine." He had addressed the crisis by enacting laws to enhance the transportation network, including the Urban Mass Transportation Assistance Act of 1970, the Airport and Airway Development Act of 1970, the Rail Passenger Service Act of 1970, and the Merchant Marine Act of 1970.

It described other accomplishments and initiatives:

> To reduce traffic and highway deaths, the National Highway Traffic Safety Administration has been reorganized and expanded, with dramatic results. In 1971, the number of traffic deaths per hundred million miles driven was the lowest in history.
>
> To help restore decision-making to the people, we have proposed a new Single Urban Fund providing almost $2 billion a year by 1975 to State and metropolitan areas to assist local authorities in solving their own transportation problems in their own way.

> Our proposal for Special Revenue Sharing for Transportation would also help governments close to the people meet local needs and provide greater freedom to achieve a proper balance among the Nation's major transportation modes.
>
> To revitalize the surface freight transportation industry, we have recommended measures to modernize railway equipment and operations and to update regulatory practices. These measures, on which Congress still dawdles, would help curb inflation by saving the public billions of dollars a year in freight costs. Their enactment would also expand employment and improve our balance of trade.
>
> The Nation's transportation needs are expected to double in the next 20 years. Our Party will continue to pursue policies and programs that will meet these needs and keep the country well ahead of rapidly changing transportation demands.

The platform's transportation plank concluded:

> The Nation's transportation needs are expected to double in the next 20 years. Our Party will continue to pursue policies and programs that will meet these needs and keep the country well ahead of rapidly changing transportation demands.

Addressing the Urban Crisis

During the weekend of June 10-11, 1972, about 100 residents of cities facing freeway battles gathered in Washington for a national conference organized by the National Coalition on the Transportation Crisis. The conference had been organized by Sammie A. Abbott and Angela Rooney, local anti-freeway activists. In 1964, they had formed the Emergency Committee on the Transportation Crisis (slogan: "White Men's Roads Through Black Men's Homes"), a coalition of African-Americans from northeast Washington and white opponents from the suburb of Takoma Park, Maryland. The immediate goal of the local committee was to block construction of the North Central Freeway (I-95/I-70S), but the group had taken in anti-freeway activists from around the country who came to Washington to lobby Members of the Congress or BPR/FHWA. While in the city, they often stayed with local highway critics to keep costs down.

During the pre-NEPA era, highway protests were usually improvised local affairs by homeowners trying to protect their homes and neighborhoods from planned freeways. The coalition sponsored national conferences in 1968 and 1969 as a forum to exchange information and ideas, but according to Abbott, the conferences were not held for 2 years because "we didn't have the money and we didn't have the forces." The 1972 conference was hastily arranged after Abbott collected $200 for a speech and $500 from a foundation. "With the $700, we had the option of preparing for a big conference in the fall after the election or having one now. We decided to do something in a short time so we could hope to have some effect on the election."

Participants appeared less interested in the election than in learning effective techniques for blocking highways. An article about the meeting concluded:

> However, it was law suits and air pollution that appeared to be the foremost interest of the freeway fighters who gathered for the conference, held at Catholic University. At one point, Emilia Govan, a leader in the fight to block construction of Interstate Route 66 inside the Capital Beltway in Virginia, asked how many people were involved in law suits against proposed freeways. About 20 people raised their hands.
>
> "And how many are contemplating litigation," she asked. Most of the remainder of the people raised their hands.
>
> To this, Mrs. Govan responded: "Good stuff." [Barnes, Fred, "Freeway Foes Meet to Plan Election Role," *Washington Evening Star*, June 13, 1972]

(Mrs. Govan and her husband James became leaders in the battle to block I-66 after attending a public hearing the Virginia Department of Highways held on September 29, 1970, in the Washington and Lee High School auditorium. Over 700 people reacted to the State's presentation with what the *Fairfax Sentinel* called "a great roar of righteous indignation." The Govans, who lived three blocks from the projected path of I-66, had hoped for information on the location of interchanges, the type of overhead lighting, and whether noise walls would be included. Instead, as James recalled years later:

> There was no information available for the public to look at . . . . There were no politicians or elected officials present. The highway officials were condescending and cut citizens off with curt responses. People couldn't get answers to basic questions. People were very upset when the hearing was over and simply started exchanging phone numbers.

(Emilia added that when the State revealed that I-66 would be 14 lanes wide in Rosslyn, "the whole thing crystallized for us." In October 1970, the Govans were among about 20 founders of Arlington Coalition on Transportation (ACT). In a history of the fight to kill I-66, Leland J. White described ACT:

> With a peak membership of approximately 1,500, ACT was predominantly composed of middle-class whites, many of whom worked for the federal government. Some lower income and elderly apartment residents along the proposed I-66 path also got involved. Because the highway's route did not include any areas with sizable racial or ethnic minorities, these were little represented. The group was fairly evenly split along gender lines, although women were more active in the day-to-day activities since many did not work outside the home and had more time to devote to the cause. With the Govans serving as co-chairs, ACT was loosely organized and operated on a shoestring, charging dues of two dollars per member. [White, Leland J., "Dividing Highway: Citizen Activism and Interstate 66 in Arlington, Virginia," *Washington History*, Spring/Summer 2001, p. 58-59]

While the conference was underway, *The New York Times* reported that, "The Urban Mass Transportation Administration has moved out of its organization days and into full operation." The Urban Mass Transportation Act of 1964 had assigned administration of transit funding to the Housing and Home Finance Agency in the Department of Housing and Urban Development. When the transit function was shifted to the Department of Transportation in 1968, the transit component became UMTA. Now, with a pending $1 billion budget for FY 1973, Administrator Villarreal said, "For the first time we have a meaningful program to improve public transportation."

The article stated:

> UMTA's mix of programs has lifted the mass-transit industry out of a lethargy that has lasted since the end of World War II. Profits for mass-transit systems began a steady decline then and last year such systems ran nearly $300-million in the red. During that period there was virtually no technological advance as Americans looked to the automobiles and the growing highway systems to provide them with transportation.
>
> But now Mr. Villarreal hopes to reverse that trend. "The transportation problem isn't limited to big cities," he said. "We have to realize that public transportation must complement the automobile. We have to offer an alternative."

UMTA was providing funds for subways and buses, but also for innovative facilities such as a 3-mile people-mover system built by Boeing in Morgantown, West Virginia, and the tracked air-cushion vehicle that Secretary Volpe had mentioned in his WASHO speech the week before. The article concluded:

> City and state officials and those in the transit industry are pleased with UMTA's work so far but hope for still more Federal funds, including operating subsidies, in the future. "The money is a very impressive figure, but it's still not enough," said Jack J. Hargett of the Institute of Rapid Transit. "It should have been a billion dollars annually long ago." ["Mass-Transit Agency Moves into Full Operation," *The New York Times*, June 11, 1972]

The Department of Transportation issued new metropolitan transportation planning requirements in mid-July 1972 calling on all areas with a population above 1 million to submit unified work plans to the Department to qualify for assistance. All SMSAs must have approved plans by mid-1974. Richard Bouchard, the Department's Director of Transportation Planning Assistance, explained that the new requirements resulted from a view that comprehensive planning for urban areas was not working:

> For 30 years those in urban transportation have said problems must be dealt with on a metropolitan basis, yet there is no effective decision making mechanism in government today to accomplish this. As a substitute we have established ad hoc arrangements. Some argue that this process has met with some success, and I would agree. But I would add progress has not been commensurate with the need.

Bouchard explained the key change:

> In the past, comprehensive plans concentrated on the traffic and economic consequences of building large regional facilities with little emphasis on balance between modes or consideration of social and environmental impacts.

Projects often were approved because they lacked negative impacts rather than because they contributed to a positive, integrated plan:

> From now on, DOT will be asking such questions as: Who will do the planning; how will each responsible agency carry out its mission; how much money will be needed; and what will the chain of command be for implementation?

One consequence was that a single metropolitan policy body would have to be designated to prepare the work program. Some areas had established informal groups to carry out the metropolitan transportation planning requirements of the Federal-Aid Highway Act of 1962, but the Department did not find that the resulting plans were satisfactory.

Under the new plan, the unified work program would serve as a baseline; only projects in the program would be eligible for Federal-aid highway, transit, or airport funding. The new body would prepare a long-term plan as well as an annual update. This was critical, Bouchard said, because "a major consequence will be staging decisions throughout the study process rather than leaving them open until the adoption of a master plan at the end of a long-term study." Changes could be made throughout development in a flexible and dynamic process.

Although obtaining Federal-aid might be harder, Bouchard said:

> It will help enable cities to make a single comprehensive grant application. Our office isn't designed to walk mayors through the process and show them how to fill out a federal form. But with a policy like this we can make it easier for them to integrate their grant applications. What we are hoping to do here is to provide help to mayors and other elected officials. The highway, airport, and transit people have their own units at the federal level. The elected officials don't and what we are trying to do is help them.

An analysis in *Engineering News-Record* said that, "DOT is in a sense substituting itself for the missing local mechanisms that have failed to develop truly comprehensive and complementary plans." It added:

> In a sense, the policy Bouchard outlines reinforces Transportation Secretary John Volpe's proposal for a Single Urban Fund (SUF), changing the present balance of highway, airport and transit spending. He would permit metropolitan areas to shift money between accounts, with 40% of the earmarked SUF allotments going directly to urban areas. But they would have to establish means to handle areawide problems or lose control to programming and spending to state governments.
>
> Even if Congress does not approve Volpe's SUF plan as part of the biennial highway act, and chances are that it will not, the unified work program will accomplish his aim of establishing strong metropolitan agencies and making them work.
>
> "It seems to me that a work program put together as we describe it both from an institutional and a technical point of view sets the stage in any metropolitan area for that city to be in a

> position to respond fully to both enacted and proposed legislation," says Bouchard. ["Metropolitan Areas Must Draft Unified Transportation Programs," *Engineering News-Record*, July 13, 1972, p. 10]

The Senate's Federal-Aid Highway Act of 1972

Mobil Oil Corporation published another in its full page ads in *The New York Times* on July 20, 1972:

LET'S GET MOVING
WITH A NATIONAL MASTER
TRANSPORTATION PROGRAM

Anyone who uses mass transit "knows our mass transit is pitiable." The benefits of improving mass transit included easing traffic jams, reducing air pollution, and conserving energy fuel. It also would "make moving around a lot more civilized." Rather than thinking about each mode separately, "we should approach them as part of an overall transportation plan." The ad explained:

> To carry out that plan, Congress should enact a National Master Transportation Program. The money should come from direct Congressional appropriation, based on clear and rational priorities. In the process, the Congress should review all special earmarked funds, including the Highway Trust Fund.
>
> Mobil supported the Highway Trust Fund when it was enacted in 1956, as a logical way to raise and husband the money needed to build the Interstate Highway system. Now we believe a new look is needed at the whole question of transportation and transportation funding.

Continuing the Highway Trust Fund indefinitely "could deter construction of more-urgently needed non-highway transportation facilities." It also could "encourage expansion of the fund's goals at a time when they ought to be cut back." Further, some urban sections of the Interstate System in, for example, lower Manhattan and south Philadelphia should be reviewed. "It is not at all certain that the benefits from these sections would justify the outlay."

Highways were important to Mobil since highway travel builds gasoline sales. "But traffic jams, and a glut of cars using too much gasoline to haul too few passengers, waste many resources, including oil." Mobil wanted its products to "help more people get where they want to go, with greater ease and less waste than is now possible."

While the Department was pursuing its balanced, flexible approach to transportation, the Senate Committee on Public Works was completing work on the Federal-Aid Highway Act of 1972. The Subcommittee on Roads approved a bill that adhered to traditional highway funding categories while limiting the rights of citizen to file suits against highway projects. It also authorized a new plan for toll roads and scenic and recreational highways. A rival bill introduced by Senators Kennedy and Weicker would authorize $3 billion a year for completion of the Interstate System, but free all remaining Highway Trust Fund revenue for use by States and cities for any transportation purpose. This bill was given little chance of approval.

On August 17, the Senator Public Works Committee approved its bill, but only after considerable internal controversy over transit issues. A *Washington Post* editorial on August 8 reacted to a draft committee bill by saying, "In short, this is still very much a highway bill." It "steers away from any politically uncomfortable challenge to the oft-invoked sanctity of the highway trust fund." The draft bill, according to the editorial, included at least $300 million a year "to encourage the development, improvement, and use" of highway-oriented bus facilities and, for the first time, the purchase of buses, but not for operating subsidies or rail transit. It included the new scenic roads program as well as a major effort to build bicycle lanes and trails. It authorized creation of metropolitan regional transportation agencies, but without the ability to mix transportation modes.

The editorial added that the draft chipped away at the environmental safeguards that kept "highway bulldozers from demolishing other public values." It did this by proposing "an entirely new alternative planning process which might enable states to wiggle out from under the detailed requirements of federal law." The editorial also regretted the measure introduced by Senators Lloyd Bentsen (D-Tx.) and John Tower (R-Tx) that would de-federalize the U.S. 281 expressway through Brackenridge-Olmos Basin Parklands in San Antonio so the project could advance with State funds, free of Federal restrictions. Overall, the Kennedy-Weicker bill was "a route toward sensible, comprehensive transportation planning which certainly should be explored." ["Better Transportation or Just More Highways?" *The Washington Post*, August 8, 1972]

On August 9, the committee considered an amendment introduced by Senator Muskie that would make available all urban Interstate highway construction funds for alternative public transportation systems in urban areas if the Governor determined that such systems are necessary to implement air quality standards or for other public purposes. Senator Cooper offered an alternative that would make all Federal-aid urban system funds available for public transportation facilities, including fixed rail, with local officials responsible for deciding on funding use. Senator Muskie joined in the motion and the committee voted 8 to 7 to adopt Senator Cooper's substitute.

One of those voting for the Cooper-Muskie amendment was Senator Stafford of Vermont. Overnight, he changed his mind. On August 10, he requested reconsideration of the previous day's vote. Efforts to table the motion, led by Senator John V. Tunney (D-Ca.) failed (8 to 7), and the committee then rejected the Cooper substitute, 7 to 8. Senator Muskie offered his original amendment for consideration, but it, too, failed, 7 to 8.

Senator Stafford said in an interview that he had decided to vote for the measure the day before after talking with Secretary Volpe. "Overnight, on reflection, I realized that my original view was right. I come from a rural state, you know." Senators Cooper and Muskie planned to introduce their amendments when the bill was under consideration on the Senator floor, but acknowledged that prospects were not good without committee approval. [Rosenbaum, David E., "Senate Panel Bars Road Funds to Aid Mass Transit," *The New York Times*, August 11, 1972; "Rollcall Votes During Committee Consideration," *The Federal-Aid Highway Act of 1972*, Report of the

Committee on Public Works, United States Senate, 92nd Congress, 2d Session, Report No. 92-1081, p. 47]

The August 10 vote ended prospects for rail transit funding in the committee bill, but the measure to allow the use of Highway Trust Fund revenues for bus purchases was in S. 3939 as approved on August 17—buses for urban areas, and a separate $50 million for buses in rural areas. Senator Randolph, speaking of the restriction on rail transit, emphasized that the committee intended to supplement UMTA funding for rail, not to serve as an excuse for weakening Federal financing for rail systems. [Eisen, Jack, "Road Funds Voted for Bus Purchase," *The Washington Post*, August 18, 1972]

Key provisions of S. 3939 included:

- Interstate construction authorizations would be reduced from the present level of $4 billion a year to $3.25 billion through FY 1979, with the completion date extended to June 30, 1980. This reduction, according to the committee report, was needed "to make more funds available for other vital programs such as highway safety, urban transportation, and upgrading the long-neglected Federal-aid primary and secondary systems."
- To facilitate resolution of controversies over urban Interstates, the bill would allow States to substitute alternative segments with the consent of local governments. "Dollar for dollar" substitution would be permitted rather than "mile-for-mile" substitution under the Howard-Cramer provision as in the past. If an alternative was not necessary for a connected system or the cost of the alternative was less than the cost of the original, the remaining funds could be used in the same urban area for projects on the Federal-aid urban system, including projects for public transportation purposes.
- In a "major departure," the bill recommended that "properly constituted metropolitan transportation agencies" would have direct control of Federal-aid urban funds. They would be "passed through" the State to the agency to "increase the ability of local elected officials to determine how these funds are to be used." The agency "must have sufficient authority to develop and implement a plan for the expenditure of funds allocated to it for the urban system including highway public transportation."
- The bill created a "small urban system" in urban areas of 5,000 to 50,000.
- The committee emphasized highway-oriented bus transit to supplement UMTA funds. It expanded eligibility to include the purchase of passenger equipment other than rolling stock for fixed rail at a Federal share of 100 percent. Of the $950 million authorized for the urban system, $300 million must be spent for carrying out highway public transportation measures. The report stated that, "The Committee believes that costs of rail transit systems, especially subways, are so high that the Highway Trust Fund would not be able to bear any substantial share without seriously impairing its ability to meet the highway needs of the Nation."
- Section 121 modified the Highway Beautification Act of 1965 to loosen restrictions on outdoor advertising. The 660-foot limit on the control of signs along the Interstate and Federal-aid primary systems would be eliminated, as would the penalty for States that do not remove signs beyond 660 feet that are visible from the main traveled way. With the limit removed, the authority to erect approved signs in areas zoned industrial and commercial that

were now valid within 660 would be extended beyond that distance. Signs that were not in conformity with State law would have to be removed within 5 years after they became nonconforming. Just compensation would be paid for the removal of all outdoor advertising signs that were lawfully erected. Further, the measure imposed a 2-year moratorium on the Secretary's authority to require States to remove any directional signs ("giving specific information in the interest of the traveling public," such as the location of motels, restaurants, and roadside attractions) lawfully in existence on June 1, 1972.

- To address red tape, the bill provided an alternative procedure to turn over to the State highway agencies the day-to-day execution of the Federal-aid highway program, consistent with guidelines issued by the Secretary and subject to continuous audit by the Secretary. "This procedure when implemented would prevent the withholding of apportioned highway funds."
- After receiving its final Interstate funding, a State may use Federal-aid primary funds for new toll roads or improvement of existing toll roads. The Federal share would be up to 70 percent, not including the cost of toll collection and service areas. "This financing arrangement would enable States lacking adequate resources to construct desperately needed roads to do so in a relatively short order." Further, any existing toll road included in the Interstate System as of June 30, 1968, that became toll free prior to July 1, 1976, would be eligible for improvement with Interstate funds. Finally, if construction of a toll road has seriously impaired the capacity of three or more Interstate routes interchanging with the toll road, Interstate funds could be used to improve interchange capacity.
- All Federal-aid highway funds could be used for construction of separate or preferential bicycle lanes, paths, or related facilities and equipment. In addition, the bill authorized $10 million a year for FYs 1974 and 1975 for bicycle projects in connection with new or completed Federal-aid projects, while the earlier eligibility change would apply only to new projects.
- The bill also made funds available for construction of separate walkways, including overpasses and underpasses, and equestrian trails in connection with new Federal-aid highway projects.
- Among numerous highway safety measures, addressed in Title II (Highway Safety Act of 1972), the committee included grants to the States to support highway safety programs, including programs administered by NHTSA. Funding was made available for a new program to eliminate roadway dangers on existing roads, including railroad grade crossings. The bill included $20 million in grants to States that demonstrated special efforts to comply with safety standards. ["Major Provisions, *Highway Act of 1972*, p. 5-27]

On August 18, Secretary Volpe sent a letter to Senator Randolph expressing the department's views on the approved bill. The Secretary appreciated the extension of eligible Highway Trust Fund expenditures to the purchase of mass transit buses, although he thought it should have gone further to include rail transit. He also supported providing funds directly to metropolitan transportation agencies as well as the need to direct resources to other priorities now that the Interstate System was nearing completion.

He objected to several provisions, including the alternative procedures that "would eliminate the ability of the Executive Branch to effectively establish program priorities and overall funding levels" and "disrupt the cooperative Federal/State relationship that has existed for better than 50 years. While the Administration has been trying to reduce the number of categorical grant-in-aid programs, the bill "would do just the reverse" by including a "proliferation of still more grant programs," such as small urban, Interstate transfer, highway public transportation, toll road, and bicycle/walkway/equestrian trails.

The 100-percent funding for bus purchases was objectionable because the increased Federal share favored one mode over another; the Federal share should be 70 percent. Secretary Volpe also stated that the "overall funding level contained in this bill is far in excess of the level we recommend and well beyond the level which is fiscally responsible" at a time when "we are finally reducing inflation" and fiscal restraint is more important than ever.

In addition, Secretary Volpe objected to the 2-year moratorium on removal of outdoor advertising with directional messages. The "very broad language" of the provision would prevent "the removal of this visual blight from our nation's highways" and not only disrupt the program but bring it "to a complete standstill." He urged deletion of this provision.

The committee report reprinted Secretary Volpe's letter and the views of Senators Muskie and Tunney. They objected to the bill's failure to support a greater range of locally developed transportation alternatives:

> Today the Federal-aid highway program, supported by the Highway Trust Fund, is the subject of widespread citizen dissatisfaction in all areas—urban, suburban, and rural—where Federal funds are used to build highways. Trust fund monies are readily available to construct highway solutions . . . . On the other hand, Federal support for non-highway solutions to transportation problems such as mass transit—is in short supply . . . .

They objected to the self-perpetuating nature of the Highway Trust Fund as well as the continuation of policies favoring the use of motor vehicles that waste nonrenewable resources. "The Highway Trust Fund must be utilized to support a broader, more economical and more efficient transportation system." They promised to offer amendments on the Senate floor that will "recognize the differences between rural and urban America." Their amendments would "provide the means of assuring that, within metropolitan areas, all available transportation alternatives are considered and the most appropriate systems are constructed." ["Individual and Supplemental Views of Mr. Muskie and Mr. Tunney," *Highway Act of 1972*, p. 53-55]

Senator Cooper also offered views, although he was mostly supportive of the bill. On the subject of urban mass transportation, he had hoped to remove the restriction on rail transit. He said he had joined with Senator Weicker as a sponsor of S. 3037, which would have eliminated the restriction. He also praised the Administration for its Single Urban Fund proposal, but it "failed to attract widespread support primarily because it proposed to transfer financing of the Urban Mass Transportation Act from general fund appropriations to the Trust Fund . . . ." He did not believe that the Highway Trust Fund "can or should be the sole source of financing for both mass transit and highways," but "the time has come to resolve this issue, and to enable cities to better manage their capital expenditures for those closely related transportation modes." He intended to offer the

Cooper-Muskie amendment during Senate debate on the bill. ["Individual and Supplemental Views of Mr. Cooper, Urban Mass Transportation," *Highway Act of 1972*, p. 60-61]

Congress began its August recess on August 18 and would not return until September 6. By the end of the recess, the Nixon Administration was ready to concede that the Single Urban Fund would not be approved. It was looking for a way to get as close as possible to its goals as it could in the period leading up to the election.

1972 National Transportation Report

The Department of Transportation Act of 1966 directed the new department to "develop and recommend to the President and the Congress for approval national transportation policies and programs . . . with full and appropriate consideration of the needs of the public, users, carriers, industry, labor, and the national defense . . . ." To carry out this mission, the Department needed to gather information.

On September 25, 1970, Secretary Volpe had announced what a press release called "the first positive Federal action ever taken to determine national priorities in the establishment of a balanced transportation system." The objective was to develop a transportation plan by 1972. He began by sending letters and questionnaires to the Governors of the 50 States and Mayors of cities over 50,000 population, as well as leaders of the transportation industry. He explained:

> This survey is designed to define the areas in which public and private funds are needed through 1990 to finance highways, public transit systems, airports and other terminals, railroads, waterways and pipelines. Once the needs and anticipated costs are submitted to us, Department of Transportation specialists will analyze the material and develop a national transportation plan.
>
> The planning process, although new to the total transportation system, has been utilized by the Department in planning and construction of the interstate highway system. [It] will not be a one-shot effort but will function on a continuing basis. It is apparent to those of us concerned with national transportation policy that there has been little balance or consistency in transportation planning and programming. On occasion, this has resulted in modal interests competing in the political forums and private money markets for available investment resources. Frequently there is insufficient regard for national objectives and too little concern for the ramifications of the interaction between the public and private sectors.

The report would supplement reports the Department already was required by statute to prepare on individual modes:

- The National Highway Needs Report
- The National Airport System Plan

After analyzing the data submitted by the Governors, Mayors, and industry leaders, the Department planned to analyze alternative based on national objectives such as economic efficiency in transportation, protection of the environment, the improvement of safety, and the support of other national objectives.

Secretary Volpe transmitted the July 1972 report, *1972 National Transportation Report: Present Status – Future Alternatives*, to Congress on August 3, 1972. It was, he said, the first in a series of reports "on the state of the nation's transportation system and the planning alternatives of Federal, State and local governments for improving the system over the longer range future." The report provided:

- A comprehensive picture and future outlook of transportation;
- Estimates of investment needs and program priorities as seen by States, local governments, and the private sector;
- Analyses of selected issues in urban and intercity transportation; and
- Guidelines for future action by Federal, State and local governments and the private sector.

The concept of "transportation needs" caused some confusion, the report stated, because different modes and the private sector defined their needs differently. Highway and airport needs could be measured against approved standards for measuring deficiencies, but urban public transportation needs were based "generally on the costs of implementing existing plans prepared by the comprehensive transportation studies in the larger urban areas." Private sector needs stemmed from "projected streams of investment" based on past trends or using "estimates of the ratio of capital stock to future projected demand."

In short, "the reported needs from both the State and private sector are thus not necessarily justified economically or socially." The report, therefore, went "beyond the use of needs as a criterion for the efficient allocation of Federal funds." The Department asked each State to develop and report alternative capital improvement programs based on realistic Federal fund levels and flexibility; forecast travel and freight flow by mode; surveyed most transportation facilities and services at the State level to determine the types of improvements likely to be more profitable and of value to society; and surveyed the private sector to obtain estimates of future capital investment requirements. [*1972 National Transportation Report*, p. 4-5]

In an overview, the National Transportation Report stated:

> The Nation's transportation system has undergone significant changes over the last decade. Freight expenditures have increased more rapidly in trucking than in rail; air cargo, although still small in volume, has increased dramatically. Intercity as well as urban passenger movement has occurred primarily by private automobile. In urban transportation the comparatively mild increase in cost of private automobile transportation is partly response for a massive shift in its favor. Urban transit expenditures have declined severely. Airlines have captured most of the remaining intercity travel expenditures. [*1972 National Transportation Report*, p. 13]

The Nation's expenditures on transportation, including government and private activities, amounted to over $181 billion in 1970:

> Highway-oriented expenditures accounted for about 82 percent of the total. Rail and air each accounted for about 7 percent and 5 percent, respectively. While highways are important carriers of both passengers and freight, the rail expenditures were mostly for freight movement and air expenditures were for passenger movement . . . . The dominance of highway-oriented modes becomes even more evident when it is realized that in 1970 expenditures on intercity freight moved by truck ($20.4 billion) were greater than the combined total for the rail, air, water, and pipeline modes. In addition, $19.9 billion was spent on local truck freight and $33.2 billion on primarily nonfreight trucking in the employ of services and utilities.

Highways also dominated passenger travel:

> Highway passenger travel accounted for 42 percent of the Nation's transportation expenditures with $73.2 billion spent on automobiles and taxicabs as compared with $3.0 billion on all buses, i.e., transit, intercity, and school. The automobile dominated local and intercity transportation. In local public transportation, expenditures for taxicab transportation ($1.9 billion) exceed those on transit buses ($1.2 billion). [*1972 National Transportation Report*, p. 14]

These figures paralleled government expenditures. From 1957 to 1970, the Federal Government spent more than $66 billion for domestic transportation, with about 71 percent ($47 billion) going for highway programs, mostly for the Interstate System ($31 billion). Only about 1 percent was spent on public transportation during those 14 years, although expenditures had increased to more than 2 percent in recent years. [*1972 National Transportation Report*, p. 25]

Recent trends favored highways in urban areas:

> Most increases in urban transportation facilities have occurred in highways rather than rail. Municipal road mileage increased 28 percent from 1960 to 1970; this figure is conservative in that it does not directly reflect increases in road width that have occurred in many municipalities . . . .
>
> Federal Government transportation expenditures in urban areas have been particularly highway oriented. Over the period 1957-70, about $21 billion has been spent on urban highways as against about $703 million for public transit. [*1972 National Transportation Report*, p. 42]

The difference in expenditures is reflected in public preferences. Metropolitan areas had grown over the past decade, but virtually all of the increase was outside central cities, resulting in more cars per capita and per household:

> This has important consequences for public transit, for one or more of the cars of a multicar family is usually used by the wage earners for transportation to work and back. These auto trips are impinging on a key revenue-generating source of public transit . . . .

> Thus, it appears that the public transit industry is not providing an acceptable alternative to the automobile, especially in suburban areas. Moreover . . . the problem has been compounded by increasing fares and (to a lesser extent) reduced service. Accordingly, an unfortunate cycle has developed that, unless checked, will lead to the demise of many transit systems.

One result was the decline in private ownership of bus, rail, and trolley systems:

> According to the American Transit Association, there were 146 fewer systems on December 31, 1970, than on that date in 1959; however, there were 235 fewer private systems because many of the private systems were taken over by local municipalities. The result was a net increase of 89 publicly owned systems.

All modes of public transportation except taxicabs experienced declining revenue from 1960 to 1970:

> The greatest declines were in surface rail and trolley coach, but these were not offset by a shift to subway and elevated rail or motor bus. Rather, the shift has been either to private automobiles or to taxicabs and other personalized transportation, such as automobile rentals. Faced with declining patronage and increasing costs, transit companies have increased fares and, to a lesser extent, cut back service, especially in non-peak hour operations. [*1972 National Transportation Report*, p. 45-50]

The key point, the report concluded, was that "demand deficiency, especially for bus transit, is the main cause of the economic difficulties of urban public transit." The report explained:

> Costs have increased more rapidly than revenues in spite of large fare increases, but this is primarily because service levels have not declined as drastically as passenger levels. The industry is simply not filling buses and rail passenger cars the way it must to maintain a healthy economic posture.
>
> Consumer preference for the private automobile is undoubtedly the main cause of the demand deficiency in public transit. The industry has not yet found a way to change this preference at an acceptable economic cost. How to do this is, of course, the main issue that needs to be resolved. [*1972 National Transportation Report*, p. 59]

Looking to the future, the most important factor "for assessing transportation investment needs [is] the growth of traffic on the transport system." Growth would undoubtedly continue, but predicting how much could not be done simply by extrapolating from past growth patterns. The best approach is to "comprehend the forces that generate traffic and project traffic on the basis of expected trends in these forces." [*1972 National Transportation Report*, p. 85-86] Those factors included:

- Population: projected to be 227 million people in 1980 and 255 million in 1990;

- Income: Gross National Product (GNP) was expected to increase at a rate of 4.7 percent per year through 1980, rising from $936 billion in 1970 to $1,481 billion in 1980 and at the rate of 3.5 percent per year from 1980 to 1990, with GNP reaching $2,096 billion;
- Location patterns: western migration of population was expected to continue as was the shift to the suburbs;
- Price trends: "price movements have given an impetus to traffic growth on some modes and have impeded traffic growth on other modes," with air traffic benefiting from reduced fares, transit use declining because of increased fares, and the cost of operating an automobile likely to increase; and
- Quality of transportation: measured based on "swiftness, reliability, convenience, accessibility, and comfort," with service improvements since World War II occurring unequally—the Interstate System giving highways a "tremendous boost" and airlines gaining because of such factors as reduced fares and use of jet engines, while local public transit was "the only major form of transportation on which the quality of service has deteriorated and retarded traffic growth." [*1972 National Transportation Report*, p. 87-92]

Based on these projections, extrapolation from historical trends, and other factors, the report estimated growth patterns:

> Annual per capita travel on commercial modes will increase from roughly 1,000 passenger-miles in 1970 to 1,800 passenger-miles in 1980 and to 3,000 passenger-miles in 1990. Passenger travel in private motor vehicles will climb from 5,000 vehicle-miles per person per year in 1970 to 6,500 vehicle-miles in 1980 and 8,000 vehicle-miles in 1990.

Commercial passenger travel was expected to increase more rapidly than private transportation, primarily because of growth in aviation. The report forecast that local transit would grow at 2.0 percent per year "despite the fact that transit revenues have declined about 2.2 percent per year during the past 5 years." The reason for this paradox was:

> Public policies aimed at solving a number of urban problems are expected to produce this turnaround in transit use. Policies aimed at producing a more rational land use will include revitalized mass transit. Solution of the congestion and pollution problems plaguing cities will suggest greater reliance on mass transit. [*1972 National Transportation Report*, p. 93-94]

In assessing modal needs, the report stated that "they may be considered as representing an upper limit to the improvement projects that might be candidates for funding." [*1972 National Transportation Report*, p. 122]

The estimate of highway needs was based on "the most extensive effort to date to obtain an estimate of the cost of bringing the Nation's highways up to a uniform set of standards." The States were able to develop an inventory of existing facilities and assess needs within the short time frame available only "because of the research funds of the Federal Highway Trust Fund, and because of the long history of experience and professional development of the State highway agencies." For the period through 1990, the report found:

> The total needs estimate for the Highways category resulting from the Study came to $593 billion, including $32 billion for completing the Interstate System. Slightly under one-third of this amount was for local roads, and about one half of it was for arterial facilities. The remaining one-sixth was for collectors. Forty percent of the non-Interstate-Highway needs estimate was reported for urbanized areas based on 1990 population and boundaries, about 7 percent was reported in the small urban areas with populations between 5,000 and 50,000, and the remaining 53 percent in the rural areas.

An estimate of funds available for highways over that period indicated that highway needs were "roughly double the future funds available for that program." [*1972 National Transportation Report*, p. 124-125]

The lack of uniform standards was a problem in assessing urban public transportation needs. Because planning is a local responsibility, setting national transit standards for level of service and performance would not be "in consonance with the goals and objectives of every metropolitan area." The report estimated urban public transportation needs through 1990 to be $63.4 billion. [*1972 National Transportation Report*, p. xi, 126-127]

Urban transportation was "the most important segment of the Nation's transportation system because of the concentration of population in urban areas." About 74 percent of the Nation's population lived in cities and their suburbs, with that figure expected to increase to 82 percent by 1990:

> The development of land at urban densities occurred at a pace that was not, and probably could not be, matched with the provision of adequate physical facilities—in this instance, transportation facilities.

The population shift, coupled with the growing affluence of the populace, "created a real challenge in providing urban transportation service." Urban transportation systems "operate reasonably well" in moving large numbers of people and quantities of goods, but they have several problems. First was congestion, which generally reduced mobility during peak periods. Providing sufficient capacity for those peak periods was "generally too costly and inefficient." However, to some extent, "congestion results from peak-hour travelers not paying the full cost of providing additional peak capacity as well as from the failure to develop and apply more innovative solutions, both physical and institutional to deal with congestion."

Second, modal choice was too limited. For those with an automobile, it provided full access to the area, but for those who cannot afford one or do not want one, transit provided "a generally poor level of service and does not provide service to a large portion of travelers in an urban area."

Third, urban transportation had undesirable environmental effects. "These include air pollution, noise, accidents resulting from the operation of the system, disruptions and dislocations of homes, businesses, and communities, and the taking of scarce urban land for construction of the system." The consequences were ignored for many years because they "were not understood," but now the social and environmental costs of transportation decisions were factoring into planning transportation systems.

Finally, urban transportation facilities too often have been provided without taking full advantage of the opportunity to use them to foster desirable development patterns. In the past, transportation followed development and had "not been used to encourage development patterns that an urban area seeks as desirable."

These problems must be addressed as part of the solution to urban transportation problems. We have the ability to implement improvements that would address these problems, but it is "only through a process that identifies and fully analyzes a wide range of alternatives that intelligent decisions can be made." [*1972 National Transportation Report*, p. 186-188]

Typically, congestion results in pressure for increased highway capacity. "However, a wide variety of techniques can be employed to improve urban transportation systems." For example, instead of adding capacity, a more "complementary approach is to improve the productivity of existing urban transportation systems through means requiring relatively little capital investment." These alternatives include increasing the occupancy of vehicles and the flow of vehicles on the system:

> The first approach has focused on priority schemes for high-occupancy highway vehicles; that is, buses and car pools, and general improvements to public transportation systems. The second approach has been directed at highway improvements requiring minimum capital cost and short leadtimes, such as traffic operations improvements, freeway metering, congestion pricing, etc. The latter approach can also affect vehicle occupancy. [*1972 National Transportation Report*, p. 197-198]

The report paid special attention to congestion pricing. "Underpricing of transportation can lead to overconsumption of travel." In three ways, urban automobile transportation appears to have been "underpriced with respect to the cost of providing it and in relation to urban mass transportation." Those three ways were cost of travel in peak hours, cost of environmental and social impacts, and cost of operating and maintaining urban highways. Increasing the cost of automobile use during peak periods would reduce the number of motor vehicle trips, shift some travel to public transportation and carpools, reduce highway and parking facility requirements, reduce undesirable environmental and social effects, and shift some trips to off-peak hours.

Two major arguments had been offered against congestion pricing:

> First, the travelers that would be most affected by pricing would be the poor travelers . . . . Second, the nature of changes in travel patterns as a result of congestion pricing is unclear.

A number of techniques had been proposed for pricing:

> They range from simple techniques, such as increasing downtown parking charges, to complex approaches that would automatically monitor all vehicles through a central

> computer and bill users on monthly terms. [*1972 National Transportation Report*, p. 206-207]

Vehicle restrictions offered another alternative for reducing congestion. Increased attention was being paid to schemes for reducing traffic in downtown areas, including creation of pedestrian malls on certain streets and prohibiting all vehicles in certain areas. In short, "an improved environment for living and working can be achieved by restricting vehicle movements in crowded portions of a city," such as the central business district.

Improving public transportation systems to entice people out of their personal automobiles was another option. Increased service and ridership could result from improved travel time, lower cost, and greater convenience by better vehicle characteristics such as air conditioning, comfortable seats, and adequate lighting as well as operational changes such as well-kept schedules, restricted bus routes to better serve demand, and "shopper specials." [*1972 National Transportation Report*, p. 208]

Alternatives such as these had the advantage of minimal cost, especially compared with construction alternatives, but the difficulties of implementation could not be overlooked. "Institutional rigidity, established public attitude and habits, and the interests of special groups must all be dealt with." To make these changes a reality would "require a major effort to encourage, promote, and implement them. [*1972 National Transportation Report*, p. 208-211]

The key was greater flexibility. Urban area officials "should have considerable latitude in the assessment of their particular problems and solutions." Also needed was "an organization at the urban level with the ability to plan and implement transportation improvements effectively, and that is responsive to the democratic decisionmaking process." [*1972 National Transportation Report*, p. 253]

The report stressed that in considering highway needs, an economic analysis was essential. The Department estimated needs to determine how such investments would affect road-user travel and operating and accident costs:

> The following significant results were obtained: First, substantially less than one-half of the highway needs reported by the States were found to be justified on the basis of direct user benefits exceeding project costs. Second, the average user benefits-to-investment-costs ratio tended to be higher for improvements on highways of higher functional class. Finally, the proportion of improvements that result in measurable road-user savings exceeding added investment costs appears much greater in urban areas, particularly urbanized areas.

Subjecting the data to economic models to assess economic justification, the report concluded that:

> The analysis of the 22-year economically justifiable investment indicated that some $38.8 billion in 1969 dollars could be expended nationwide on major new construction or reconstruction on the rural and intercity arterial highway system, including the completion of the Interstate Highway System.

An additional analysis indicated that "only $640 million would be required nationwide for the 22-year period for investment in rural and intercity arterial highways . . . to maintain, on the average, today's user costs per mile of travel."

In short, reported highway needs were considerably higher than those that could be economically justified. [*1972 National Transportation Report*, p. 274-278]

In reviewing conclusions and guidelines for future action, the report stated that the Federal Government "may in many cases not be the most appropriate agent for taking actions that are most effective." The idea, therefore, was to seek "ways of increasing the options available for State and local government action by lessening the restrictions imposed by Federal aid programs."

If restrictions limiting funds to a specific mode were lifted, "the States and urban areas would take advantage of the added flexibility individually by State or urbanized area." Some of the largest urban areas indicated they would increase mass transit funding by at least 10 percent. However, "when viewed nationwide there would not be a radical shift into or out of any one modal area of investment if program restrictions were reduced." The biggest area, 15 percent, would be for mass transit. In the largest urbanized areas, rail would be the main component:

> Rail was reported to account for 71 percent of total future Urban Public Transportation investment; 81 percent in urbanized areas of over 2 million, and 41 percent in areas from 1 to 2 million population.

If modal barriers were removed, however, only 3 of the 10 largest areas (Boston-Providence, New York, and San Francisco) projected large shifts of funding from highways to mass transit. The shifts could be substantial, including nearly $2 billion in New York. [*1972 National Transportation Report*, p. 319-320]

In considering such shifts in the use of Federal funds, Federal officials needed to consider the State and local roles in transportation planning. State officials were concerned about "the possible fragmentation of metropolitan transportation system development" if funds were allocated directly to individual jurisdictions. "This would suggest that any Federal program of this nature should provide that a local recipient body have sufficient metropolitanwide scope to insure system connectivity."

These considerations led the Department to recommend a single urban fund for urban highway and mass transit projects, as reflected in the proposed Federal-Aid Highway and Mass Transportation Act of 1972. The Interstate Highway Program would continue as a separate category, but a rural general transportation fund would be established for highways on and off the Federal-aid systems:

> The creation of a flexible fund would result in transportation expenditures more in line with the goals and objectives of States and local governments. There is no evidence from the NTS that a Federal interest would be compromised by introducing extensive funding flexibility. Indeed, the evidence indicates there would be very little change, in the aggregate, in the funding of any component of the Nation's transportation system.

The 3C transportation planning process initiated by the Federal-Aid Highway Act of 1962 required the full participation of local and State governments. For the results to reflect State and local needs, "these governments need to have access to funds to finance transportation improvements." The report recommended "that a single urban fund be established, with appropriate intermodal flexibility . . . and that 40 percent of that fund be passed through to the control of local governments."

In view of State concerns about the ability of local governments to plan systemwide facilities interconnecting with State and national systems, the Department proposed "to allow the funds to be controlled by local entities only if they create a consortium of governments formed by units of general purpose government located within a metropolitan area." It continued:

> The consortium would also have to have certain other characteristics, including membership of high-level elected officials, planning authority for all modes of surface transportation, and authority to develop an annual program of transportation projects to be undertaken in the metropolitan area. [*1972 National Transportation Report*, p. 321-322]

The report emphasized the value of urban alternatives involving little or no capital investment. These included devices for giving priority to high-occupancy vehicles, increased regulation of automobile use in downtown areas, the removal of market-entry barriers for taxicabs and jitneys, and marketing to encourage use of public transportation. Another alternative was:

> A peak-period pricing system, in which each user is required to pay for the added congestion and external consequences imposed on others, would be an effective device for rationing urban highway capacity more efficiently for those users most willing to pay. This system, however, may be technically difficult to implement and would probably meet resistance from private auto users. [*1972 National Transportation Report*, p. 324]

Many State and local governments favored Federal operating subsidies. Some suggested increased flexibility in the use of Federal-aid funding, while others preferred a separate subsidy program. "Many of the comments regarding an operating subsidy program undoubtedly were motivated by fiscal crises at the local government level." The Department supported making funds available for general public purposes or general transportation purposes, including operating subsidies. "Such provisions are contained in the Administration's proposals for General Revenue Sharing and Transportation Revenue Sharing." The premise here was flexibility for local choice. At the same time, the Department was opposed "to another categorized grant program that would make funds available exclusively for public transit operating subsidies." The report continued:

> The key point here is that such a new categorical grant program for operating subsidies would in effect result in an even more decisive role for the Federal Government in setting local funding priorities among modes and, no matter how well conceived, would require Federal intervention and control in local transit policy and managerial decisions and continue to compartmentalize local program choices rather than encourage freedom of action responsive to local priorities. [*1972 National Transportation Report*, p. 325-326]

In summary, the national transportation policy recognized "a need and an opportunity to continue to improve the responsiveness of Federal aid transportation programs to the needs of State and local governments." As Secretary Volpe put it in his August 3 transmittal letter, the information in the report "reaffirms this Administration's commitment to provide more flexibility in Federal Aid programs, as contained in the proposed Federal Aid Highway and Mass Transportation Act of 1972, introduced as HR 14759 and S. 3590." [*1972 National Transportation Report*, p. xxii, transmittal letter]

Commission on Highway Beautification Interim Report

Section 123 of the Federal-Aid Highway Act of 1970 had established a Commission on Highway Beautification to study implementation of the Highway Beautification Act of 1965. The Commission, which began operation in late 1971, was to submit recommendations on implementation of the law and the preservation and enhancement of natural beauty along America's highways that may not have been dealt with fully in the 1965 Act. The Commission also was to review current policies and practices; compile data on the extent of control of outdoor advertising; study problems related to on-premise outdoor advertising signs, promotional signs, directional signs, and signs providing information essential to the motoring public; and consider financing options, including the Highway Trust Fund, for carrying out a highway beautification program.

The 11 Commission members included Senators James L. Buckley (Conservative Party, NY), Mike Gravel (D-Ak.), Jennings Randolph (D-WV), and Robert T. Stafford (R-Vt.) and Representatives Don H. Clausen (R-Ca.), Kenneth J. Gray (D-Il.), Wilmer D. Mizell (R-NC), and Jim Wright (D-Tx.), who served as chairman. (Senators Lowell P. Weicker, Jr. (R-Ct.), and Birch Bayh (D-In.), both of whom moved on to other matters during the life of the Commission, and Representatives Ed Edmondson (D-Ok.), who did not seek reelection in 1972) and Fred Schwengel (R-Ia.), who lost his reelection bid in 1972, were former members of the Commission.)

In 1972, the Highway Beautification Commission held public hearings in Atlanta, Los Angeles, St. Louis, Meriden (Connecticut), Syracuse, Washington, and Iowa City; commissioned two nationwide public opinion polls; and held public seminars in 1973.

The Commission issued an interim report in August 1972 with the following recommendations:

- The Commission therefore recommends that Congress consider the advisability of extending the control of outdoor advertising along Interstate and Federal-aid Primary highways to those additional signs which are visible from the controlled highway and erected with the purpose of their message being read from the controlled roadway.
- The Commission believes that the question of how to get [traveler-service] information to motorists in a most efficient manner consistent with highway beautification deserves more study before it makes any long-range recommendations. In the interim it is recommending that States be allowed, and encouraged, to remove first those nonconforming billboards which have no traveler-service orientation and to defer removal of nonconforming signs giving directional information to motorists. At the same time, States are reminded of the importance of their responsibility to provide information to motorists on Interstate and

Primary highways, and it is recommended that States make greater use of the authority provided in their laws to carry out developmental work in the expansion and improvement of information systems which might be used in lieu of nonconforming outdoor advertising signs.

- It appears Congress could direct the Department of Transportation to review standards regarding businesses eligible to use such signs; content, size and placement of signs, criteria for public service signs, and other matters. Congress could also consider the language in section 131(f) which now gives specific permission for signs giving information in the interest of the traveling public only within the right-of-way of Interstate highways.
- The Commission believes that Congress should reconsider the hiatus which exists, perhaps unintentionally, in the prescribed dates of erection of [lawfully erected] billboards for purposes of Federal participation in the payment of just compensation. The Commission believes that Federal matching funds should be available wherever Federal law requires the payment of just compensation. The Commission further finds that it is State, not Federal law which renders any signs unlawful, and believes that the term "lawfully erected" clearly applies to any sign which was erected in conformity with applicable State law at the time of its erection.
- In order to carry out its responsibility to the States under Title 1 of the Highway Beautification Act, it is recommended that Congress provide steady funding for removal of nonconforming outdoor advertising signs within a reasonable time, without impairing progress under other parts of Federal or State laws relating to highway beautification. When more complete information is available about the cost of the sign removal program, it is also recommended that funding be scheduled to complete the program within a specified time.
- The Commission is not prepared at this time to recommend any Federal standards [on location, design, construction, and maintenance of on-premise signs (those advertising activities conducted on the property on which the sign is located)] but urges units of State and local government to address themselves to the development of appropriate local standards for the governance of on-premise signs.
- The Commission does not recommend any change in Federal law at this time [regarding the right of States to zone areas for commercial and industrial purposes, a practice sometimes used solely to allow erection of outdoor advertisements] but believes that Congress and the Department of Transportation should resolve the position of the Federal government regarding the rights of States to zone roadside lands, and resolve any uncertainties about the Federal acceptance of State action.

[*The Priority of Quality*, Commission on Highway Beautification, December 31, 1973, p. ii, 3, 10-14]

Rebellion Against the Concrete Ethos

After approving the Federal-Aid Highway Act of 1972, the Committee on Public Works forwarded the bill at the request of Senator Williams to the Committee on Housing and Urban Affairs. The idea was to give the committee with jurisdiction over transit the opportunity to consider the provisions in the bill relating to urban mass transportation. The Public Works Committee requested a report by September 8.

With little time after the recess, the Banking, Housing and Urban Affairs Committee held a hearing on September 7. Senator Williams, who opened the hearing, supported efforts to open up the Highway Trust Fund:

> With almost $4 billion in pending applications for urban mass transit grants and only $1 billion available under the urban mass transit act for the coming fiscal year, additional monies are urgently needed and, in my opinion, the more money that we make available, the better off our nation's citizens will be. The imbalance between highway monies and transit monies still exists. We are still spending over $5 for highways for every $1 we spend for urban mass transportation; and with our ever-increasing mass transit needs, such an imbalance can no longer be tolerated.

They had three major proposals to consider. The first was the provision in S. 3939 that would allow the use of $300 million of Highway Trust Fund money for highway-related mass transit, including purchase of buses. Second, the Cooper-Muskie amendment would allow the use of $800 million in Federal-aid urban system funding for highways or mass transit, including rail mass transit systems. Finally, the Kennedy-Weicker amendment would allow a wider range of funds, namely $2.4 billion in non-Interstate Federal-aid funds, for all types of urban mass transportation at the discretion of the cities and States.

Whatever the committee or the Congress decided, Senator Williams wanted to ensure that it would be in addition to, not a substitute for, funding under the Urban Mass Transportation Assistance Act. He hoped that Secretary Volpe would make such a pledge. "If this pledge is not forthcoming, it seems to me we would be simply robbing Peter to pay Paul and all the proposals before us become a cruel hoax and paper promises to our Nation's citizens." [*Federal-Aid Highway Act of 1972*, Hearing before the Subcommittee on Housing and Urban Affairs, Committee on Housing and Urban Affairs, on S. 3939, 92nd Congress, 2d Session, September 7, 1972, p. 3]

Senators Kennedy, Weicker, and Cooper testified in support of their amendments. Senator Kennedy explained that the Kennedy-Weicker amendment "would be a step toward rationalizing the Nation's transportation system." It would provide, he said, at least $2.3 billion for non-Interstate purposes that "could be used for the construction of public mass transportation systems and the acquisition of mass transit facilities, including rail transit." It would not affect funding for the Interstate System or from the Urban Mass Transportation Act. The funding under the amendment was "supplementary to and not in substitution of funds under UMTA."

The greatest flaw of the Public Works Committee bill was that "it still tells cities and States that highways remain the single preferred answer to the transportation crisis." In contrast, "we are in the midst of a national rebellion against the concrete ethos," with some 32 cities trying to block construction of urban Interstates that they believe "would produce more harm than good." The greatest burden "always falls on the poor and the elderly." Their homes are the ones that are torn down for the Interstates. "Those who most need mobility—the poor, the handicapped, the old and the young—are made to suffer in a society which unwisely allocates its resources away from public mass transportation."

For too long, "we have condemned the Nation to a distorted transportation system by having separate funding sources for separate modes of transportation and placing the most money with the largest Federal share in the pot marked highways." No wonder, Senator Kennedy said, cities and States had "succumbed to the Federal temptation to pour concrete over the land and pray that the transportation crisis will be resolved." The Kennedy-Weicker amendment was intended to "halt that situation" by providing flexibility to State and local officials.

He hoped that, at last, the highway lobby "would become sensitive to the needs of many of us who live in urban cities" and the surrounding suburbs:

> The highway lobby is one of the most powerful lobbies in the Congress, comprised of the oil and gas groups, the contractors, the roadbuilders, and the truckers. For years, they have been insensitive, unyielding, and unbending to the needs of the great majority of Americans . . . . I would hope that they would be willing to permit those local entities and State governments who understand their transportation needs the most to have the opportunity to vote how best to use their allocation in meeting the critical transportation crisis. [*Federal-Aid Highway Act of 1972*, September 7, 1972, p. 7-9]

Senator Weicker began by stating that "what is more important than a highway trust fund is the legislative trust of the U.S. Senate." In recent years, however, the Congress had "managed to avoid fulfilling that trust in transportation matters by deferring its powers of creativity to the supposed proprieties of an artificiality known as the highway trust fund." Highways were needed in 1956 and would be needed in the future. "What is clear now, however, is that highways alone or in overwhelming proportions are a mobility, environmental, and safety disaster." In view of congestion and the loss of 55,000 lives on the roads each year, he said, "We have become a Nation of automotive lemmings."

The Kennedy-Weicker amendment was designed to restore balance. "That in diversity rather than sameness lies . . . the answer to mobility." He and Senator Kennedy wanted "no part of the arrogant claim made on our behalf that the taxes we pay when purchasing gasoline should go to highways." Sometimes, people move by car, but others by train, bus, and plane. "And yet the Congress has said that moving by car is 10 times more important than moving by train or three times more important that moving by plane." He concluded:

> Gentlemen, please end the trance. This is illogical madness and all because of a 20-year old transportation irrelevancy. Whether it is Cooper-Muskie, Kennedy-Weicker, or the initiative of your own committee, please let the Nation know that the automatic pilot turned on 16 years ago as to national transportation has been turned off and humans are again making policy. [*Federal-Aid Highway Act of 1972*, September 7, 1972, p. 10-11]

Senator Cooper, who was not running for reelection in 1972, said that he had been on the Public Works Committee for 18 of his 20 years in the Senate. He briefly described the evolution of the committee's work to provide openings for highway mass transportation. He acknowledged Secretary Volpe's Single Urban Fund proposal "but it became evident that it did not have widespread support."

He described the Cooper-Muskie amendment, actually Senator Cooper's substitute for Senator Muskie's proposal, that would give the Governors or State highway commissions the flexibility they needed. He wanted to respond to some of the arguments used against the proposal "by those who consider that the highway trust fund should not be touched or tapped in any way." He expected the Highway Trust Fund to be around for many years. He thought that if Cooper-Muskie became law, "there would still be ample funds for the construction of the necessary roads throughout the vast rural sections of our country." While the amendment did not offer as much funding as the Kennedy-Weicker amendment, he said that Cooper-Muskie "does remove, I believe, the possibility of a conflict between the urban areas and the more rural areas in our country."

He did not think that the Highway Trust Fund should be the sole source of financing for highways and mass transit. Especially in the case of subways, "the funds made available by this and future Highway Acts cannot possibly provide the primary Federal financing for them." The time had come, however, "to enable cities to better manage their capital expenditures for these closely related transportation modes." [*Federal-Aid Highway Act of 1972*, September 7, 1972, p. 11-15]

Secretary Volpe, the next witness, said he was "pleased" that S. 3939 incorporated several Administration recommendations. However, he did not believe that the bill as presently drafted "meets the critical need to achieve efficient urban mobility through balanced transportation brought about by real flexibility of modal choice." He appreciated the efforts of the Public Works Committee to broaden eligibility to bus purchases under Section 142 ("Public Transportation") of Title 23, but he thought the provision should be "broadened further if we are to provide meaningful alternatives to our local officials." Therefore, he endorsed the Cooper-Muskie amendment that would amend Section 142 to allow Highway Trust Fund revenue to be used for rail transit projects and equalize the Federal share of non-Interstate highway and transit projects at 70 percent.

He objected to the provision of S. 3939 that allowed 100-percent Federal-aid financing of bus purchases. "The lack of some degree of local contribution detracts from the responsibility and accountability which ordinarily is applied to investments of local revenues." Senator Cooper, Volpe said, intended to offer an amendment to change the Federal share to 70 percent.

Volpe also recommended amending the Urban Mass Transportation Act to authorize $3 billion in additional contract authority to sustain the transit program from general revenues through FY 1977. Given that the Senate had acted earlier in the year on the legislation and the House was still considering it, Secretary Volpe explained that the recommendation was coming late in the process because the Administration had been awaiting congressional action on the Single Urban Fund. "Now that we have an indication—and maybe it is more than indication—of the apparent unwillingness of the Congress to adopt our single urban fund in total," he was recommending the additional $3 billion. "We feel that this funding will satisfy our objective of assuring the continued progress and the guaranty of financing for the urban mass transportation program." The UMTA program was funded through FY 1974, but the addition of this funding now would ensure local officials and the transit industry of the continuity of the program.

Senator Williams did not seek the pledge he mentioned that the funding under consideration would be in addition to, not a substitute for, the UMTA funding. [*Federal-Aid Highway Act of 1972*, September 7, 1972, p. 16-19, 26]

During the question period, Senator Robert Packwood (R-Or.) asked if Secretary Volpe would oppose the Kennedy-Weicker amendment when it came up for a vote on the Senate floor:

> Secretary Volpe. Let me put it this way, Senator Packwood. I am being—I will just use a mild term—slightly slammed because I have dared suggest an opening of the highway trust fund for a purpose which some people feel—some people feel—was not a part of its original intent. It just so happens that some of the members of this committee will remember back in 1955. I was serving as Commissioner of Public Works [in Massachusetts] when General Clay made his report to General Eisenhower. Legislation was adopted that year, but in 1956 it was enacted, and President Eisenhower saw fit to appoint me as the first Federal Highway Administrator. I was quite aware of the tremendous and gigantic program ahead of us. We set a course for ourselves, and I am very proud of what has happened under that program.
>
> By the end of this month, 80 percent of that program will be completed. Although there has been some criticism of it—I dare say that there would be someone who would find fault with the way I poured water of that pitcher into that glass—the fact remains that overall it has been a tremendously successful program. I say this especially in terms of the lack of corruption and the lack of any impropriety. Naturally, there may be some instances that might be found at levels 3,000 men down the line, but considering that this is the largest public works program in the history of the world, I think we can be proud of the record. The Federal/State partnership that has evolved in this program has been greatly responsible for that record.
>
> Today I frequently have to reply to highway contractors, for instance, who have criticized me for the step I have proposed. I have asked them what they have been doing the last 3½ years and they say, "Well, we are building highways." I said, "Fine." I said, "I have been sitting on a chair in Washington. I am not making quite as much money as you are making right now. I used to make the same kind of money or more than you made a few years ago; but the fact is, I have had an opportunity to sit in a seat where I can see what is happening, and I know that we are not solving the total transportation problem. Furthermore, unless we do something about it[,] all we will do is build more highways which are built and designed for 70 miles per hour at the very, very expensive costs but which at certain times of the day, and in some cities nearly all day long, they are utilized at 5 to 8 miles per hour. In my opinion, that's a tremendous waste of money.
>
> Senator Packwood. Do they agree with you?
>
> Secretary Volpe. When I talk to them individually, Senator Packwood, strangely enough, yes, they seem to finally say, "Well, gee, I hadn't thought of it that way." When I talk to them as a group, they never do. [*Federal-Aid Highway Act of 1972*, September 7, 1972, p. 22-23]

Senator Proxmire, during his question period, wondered why Secretary Volpe opposed the Kennedy-Weicker amendment. "It seems to me this amendment fits into the revenue sharing philosophy of the administration." Decisions on mass transit versus highways would "be made at the grass roots level by those who are closest to the problem within their State and know best." Secretary Volpe responded by comparing the amendment to the Cooper-Muskie amendment:

> I like to feel I am pragmatic in my approach to problems, and I can only say to you that I believe in this year of our Lord, 1972, that if we are able to open up the highway trust fund to include the kinds of things that the Cooper-Muskie amendment provide for, in addition to what the Senate Public Works Committee has already provided, we will have gone a giant step toward getting our job done.
>
> I think the Kennedy-Weicker proposal is one which I just do not think is in the cards to get passed this year. [*Federal-Aid Highway Act of 1972*, September 7, 1972, p. 27]

Allan Pritchard, representing the National League of Cities, discussed the focus of Federal and State funding on highways. "Compounding the inequitable allocation of funds to urban areas has been the inability of cities to use highway trust fund moneys to respond to local priorities unless those priorities call for more major highways and expressways." He added:

> More highways and expressways are not the answers to urban congestion in most of our cities. The restrictions against using full discretion in the application of the trust fund to finance comprehensive transportation systems in urban areas places rail transportation, particularly, and urban areas generally, at a disadvantage, as they compare to the highway system . . . .
>
> The question in our minds is not freeways versus rail transit, but how much of each as determined by the elected local decisionmakers.

The league, Pritchard said, supported the additional $3 billion in contract authority and an increase in Federal shares for transit projects (he estimated 80 percent rather than the Secretary's 70 percent). [*Federal-Aid Highway Act of 1972*, September 7, 1972, p. 30]

Carmack Cochran accompanied Pritchard on behalf of the American Transit Association. He said the association favored the Cooper-Muskie amendment over the Weicker-Kennedy amendment. Senators Proxmire and Cooper were surprised by the opposition to Weicker-Kennedy:

> Senator Proxmire. You are telling us then, from your standpoint, that the Cooper-Muskie approach would be better because it would assure a certain, specific amount and you think that is better than to leave it to the discretion of the State legislatures; is that right?
> Mr. Cochran. I do, sir.
> Senator Proxmire. Do all you gentlemen share that view?
> Mr. Pritchard. Yes.
> Senator Proxmire. Speaking for the cities?

> Mr. Pritchard. Yes. Well, theoretically, the Kennedy-Weicker proposal sounds as though it give a lot more discretion and potentially more use of funds in the urban areas for mass transit. We are afraid that the record of the State transportation operations, which are basically highway oriented as they deal with urban areas, have not been particularly good. Second, it is quite obvious that what we would end up with would be a project by project approval process from the State to local—to urban areas. The advantage of the Cooper-Muskie proposal is that there is a continuous flow of money to the urban area and it is possible for the urban planning process to develop a comprehensive plan, lay out its priorities, work program, and know that there is a fixed amount of money against which it can plan its total transportation program. [*Federal-Aid Highway Act of 1972*, September 7, 1972, p. 33-34]

Another witness, the American Trucking Associations' Edward V. Kiley, said:

> We share the obvious concern for urban mass transportation problems, and have no objection to any program to improve public transportation of any type. But we believe that to the extent these problems are not being solved through highway programs, there should be other, supplemental, programs.

He said the trucking industry "cannot accept the proposition that in addition to our recognized responsibility for the highway program, that we also have a special [tax] responsibility for other programs." The proposition, he said, "violates basic elements of equity and justice."

Charles A. Webb, president of the National Association of Motor Bus Owners, told the committee that it was "unfair for publicly-owned and subsidized enterprises to provide transportation at rates which sharply undercut those of their privately-owned competitors." [*Federal-Aid Highway Act of 1972*, September 7, 1972, p. 54-55]

John Kramer of the Highway Advisory Coalition also testified. He began by explaining what the coalition was. "Our two main areas of activity are promoting legislation similar to the two amendments before you and assisting local citizen groups engaged in transportation controversies." Senator Proxmire interrupted to say he appreciated the explanation because he assumed the Highway Advisory Coalition was part of the highway lobby. "No, sir," Kramer replied, "we are counter-highway lobby, as it were."

He picked up on the prior discussion with Kiley, stating:

> Now, looking at the trucking industry alone, we don't have any good national studies as to what the real costs of congestion are, but we do know that in the New York metropolitan area alone, increased delivery costs due to congestion amount of at least $100 million a year.
>
> Those costs aren't paid by the industry, I might add, rather they are paid by the people who purchase the goods that the industry delivers.

As for the suggestion that building more urban highways would relieve congestion, Kramer said, "I think the experience of the last 6 or 7 years in the highway program demonstrates that such an approach is neither practical nor desirable." He pointed out that in "at least 12 big cities, 60 percent of the land area is already given over to the movement and storage of the automobile." He continued:

> In 73 cities, according to the Environmental Protection Agency, we are going to have to limit the number of automobiles coming into the city if they are going to meet the standards of the 1970 Clean Air Act. And here we are talking about building still more highways, bringing more cars and trucks into the city. I just don't see how anyone can seriously believe that that is the answer to the problem. It is just beyond me, frankly.

Kramer wanted to address the pass-through issue in the Kennedy-Weicker amendment raised by Pritchard and Cochran in their testimony:

> I think there was a certain amount of misinformation with respect to the pass-through provisions of the bill as reported out of the Public Works committee. The two amendments don't affect the cities' control of the $800 million urban system authorization. That is the same with both bills.
>
> The only difference . . . was that the States could use most of the money authorized for programs of the Interstate System if, in their judgment, such an approach would best meet their particular transportation needs . . . .
>
> Another way of explaining it is that the Kennedy-Weicker amendment simply strikes out in each place it appears in section 142 of the bill the words "other than rail." Right now as the bill stands, States and cities can elect to use highway trust money for buses. What the Cooper-Muskie amendment does is allow cities to use the urban system funds for rail as well. All the Kennedy-Weicker amendment is doing is opening up the other programs as well. There is no change. They both have that guaranteed floor.

He also pointed out that Kennedy-Weicker would not touch the Interstate System, "the program they are particularly concerned about." Kennedy-Weicker and Cooper-Muskie "exclude the Interstate System from those programs in which local option for rail is provided."

Senator Proxmire wondered if at the end of the Interstate program, the Federal gasoline tax might not be lowered so the States that wished to do so could pick up the revenue and use it as they saw fit. Kramer said, "I think with increasing energy shortages over the years we will probably be in a situation where we will want to raise that tax rather than lower it." He thought, however, that the concept of user taxes was "a bit unreal." He explained:

> I mean if we are willing to accept the notion that particular industries or individuals have to get a direct return on every dollar that they pay in taxes in the precise area that they are paying tax—

Senator Proxmire picked up on the idea of the highway user taxes being used for any purpose. "When we talk like that I think we really generate tremendous opposition. I do not know if we do our cause much good." Kramer said the idea of user taxes was "ludicrous to me," using the analogy of taxes on alcohol. "Why can't we earmark all of the sales taxes that we pay on alcohol for saloons."

In a prepared statement, Kramer said that if S. 3939 were amended to include rail as well as bus transit, it "would go a long way toward correcting the longstanding balance between highways and public transportation." He summarized the debate between the two amendments under consideration:

> [E]ither one can pursue the approach of the Kennedy-Weicker amendment and open up all the non-Interstate authorizations of the bill for rail as well as for buses and highways on a local option basis or one can follow the line of the Cooper-Muskie amendment and just open the urban system authorization for rail transit as well as for buses.

The Highway Action Coalition favored the Kennedy-Weicker approach.

Kramer, in the statement, expressed concerns about the "Alternative Federal-Aid Procedures" provision of the Public Works Committee's bill. The coalition's concern was that by transferring "project by project approval" from the U.S. Department of Transportation to the State highway departments, the provision would "undermine those sections of the bill which give local elected officials greater leverage viz-a-viz the state highway departments in making local transportation decisions." He also thought it "might weaken the effect of important existing environmental, civil rights and housing relocation safeguards." It also would set a precedent for thwarting environmental requirements on other projects. Kramer also objected to the provision permitting construction of the San Antonio North Expressway "despite a ruling to the contrary by the Fifth Circuit Court of Appeals." [*Federal-Aid Highway Act of 1972*, September 7, 1972, p. 60-64]

In keeping with the timetable specified by the Public Works Committee, the Committee on Banking, Housing, and Urban Affairs submitted its report on September 8, 1972. The committee had voted for a two-part recommendation. The first part was to add an urban transit title, Title III, to S. 3939 to provide operating subsidies for mass transportation systems, as contained in the omnibus act, and an additional $3 billion in contract authority, as recommended by Secretary Volpe during his testimony. The committee's report explained that past Federal-aid for mass transportation had not done anything to "alleviate the financial distress of the transit industries and the increasing number of municipalities which own and operate transit systems." With this distress likely to increase in the absence of Federal subsidies, "cities and municipalities will continue to be forced to carry the burden of transit's financial decline." The report added:

> The major purpose is to assist in revitalizing the Nation's mass transportation systems by allowing States and localities to determine which systems in their jurisdiction are in need of operating assistance and, on this basis, to submit to the Secretary of Transportation a comprehensive mass transportation service improvement program to improve such service and to place mass transportation operations on a sound financial basis.

Williams proposed this measure in case the similar measure in the omnibus housing and urban development bill did not become law. Despite Administration opposition to the measure, it survived by a narrow vote, 9 to 5.

The additional $3 billion, as recommended by Volpe and put into amendment language by Senator Williams, "should satisfy the objective of assuring the continued progress and the guaranty of capital financing for the urban mass transportation program."

The second part of the committee's recommendations was in narrative form. The committee appreciated the Public Works Committee's provision making Highway Trust Fund revenues available for use within urban areas and certain rural areas for highway public transportation projects:

> The Committee feels, however, that it is most important that this proposal be further broadened to assure that viable and meaningful alternatives are provided local officials as they seek to best satisfy the transportation needs of their communities.

The committee recommended that the Public Works Committee modify Section 142 ("Public Transportation") of Title 23 to incorporate the Cooper-Muskie amendment to "provide that funds authorized for the Federal-aid urban system be available for the acquisition and construction of rail transit facilities and equipment, as well as the highway public transportation projects currently contained in S. 3939." Whether local officials decided to use the funds for highways or mass transit, "The option, in whatever case, would rest with the community, where the problems and needs are best known."

Finally, the committee stated that in view of the critical condition of mass transportation systems, it opposed impoundment of funds authorized and appropriated for the capital grant program:

> The Committee asked during public hearings for assurances from Secretary Volpe that if the Congress authorizes the $3 billion contained in Title III of the bill and the appropriations follow that the funds would not be impounded. Secretary Volpe replied: "I did not start this fight until I was given assurance that every dollar that the Congress authorized and appropriated would be spent, because the needs are there, and I have that assurance." The Committee would expect this assurance to prove valid should the Congress approve the increased authorization. [*Federal-Aid Highway Act of 1972*, Report of the Committee on Banking, Housing and Urban Affairs to Accompany S. 3939, 92d Congress, 2d session, Report No. 92-1103, September 8, 1972]

Following committee action, Title III containing operating subsidies and $3 billion in additional transit funding from the general Treasury was added to the Federal-Aid Highway Act of 1972. However, the Cooper-Muskie amendment would have to be considered on the Senate floor. The parliamentary maneuvering employed to shift the bill out of the Public Works Committee to a committee that would be less friendly to highways clouded the prospects for its recommendations.

Floor Action

As Congress convened for its final pre-election session before adjourning on October 18, transportation interests recognized that, as a headline in *The Journal of Commerce* put it on September 8, “Highway Trust Fund Under Sharp Attack.” [Xbilanow, Ale, “Highway Trust Fund Under Sharp Attack,” *The Journal of Commerce*, September 8, 1972]

On September 11, 1972, Bay Area Rapid Transit (BART) opened the first leg of its planned 75-mile system. It stretched 30 miles from Oakland to suburban Fremont. The opening made BART the first new rapid transit system to begin operation in the United States in decades. It contained many of the features that would be common among the new generation of subway systems, including automated operation via a computerized electronic network and fail-safe safety features. As *The Washington Post* put it, “Despite a decade of financial woes, political sniping, delays and bugs that plagued the system right up to opening day, the ultra-modern, fully automated BART complex represents a triumph of space-age technology and perseverance.” [Aarons, Leroy R., “S.F. Subway to Open Today,” *The Washington Post*, September 11, 1972]

On September 27, President Nixon was in California for campaign fund raisers and, as *The New York Times* explained, “visual” public events “for the benefit of television cameras . . . giving the impression he was mingling with many people.” One event was a trip with his wife Pat on 2-week old BART. They boarded the train at the San Leandro station and chatted with General Manager B. R. Stokes on the short trip to the Lake Merritt station where they visited the BART operations control center on the west side of the station. After seeing the electrified route displays on the wall of the control room, President Nixon said, “You know, it does look like NASA.”

At the San Leandro station, the President released a statement on BART that began:

> Though the Bay Area Rapid Transit system has been in operation only a matter of days, it already appears that the San Francisco Bay area may become as widely renowned in the future for the space-age efficiency of BART as it has been in the past for the romance of the cable car.

BART, he said, set an example for the Nation, with bipartisan support from Republican and Democratic administrations at the Federal level, as well as State, local, and private sector involvement. Through 1972, UMTA had authorized $181 million for BART, about 13 percent of overall costs and he was pleased to announce an additional Federal capital grant of $38.1 million for BART.

The President said:

> Not only here in California but all across the Nation, the urban transportation picture is brightening as we move into the 1970s. Not only are some cities, such as Washington, following San Francisco in the installation of fixed rail systems, but others are meeting their transportation needs through innovations such as exclusive-use rights-of-way for buses.

He stressed that he had proposed the $10 billion authorized by the Urban Mass Transportation Assistance Act of 1970, adding that the "better transportation balance which we are striving for is indicated by the fact that in fiscal year 1973, for the first time, Federal funds for urban mass transit will surpass spending on urban highways." He explained that the General Revenue Sharing legislation and the Federal-Aid Highway Act of 1972 that he hoped to sign soon would increase funds that local officials could use for transit:

> I was most gratified—as were city officials across the country, and the millions of citizens they serve—when in passing this bill the Senate accepted my Administration's proposal that the Highway Trust Fund be opened up to permit urban areas to use monies from the fund for public transportation if they so choose. This provision would not in itself take a cent away from highway needs[;] in fact, it scrupulously plays no favorites among the various alternative answers to urban transportation problems. What it would do is to give the people at the local level—the people who know best—a freer hand than they have had before in choosing that combination of answers which best suits their own particular needs.
>
> I hope that this sensible provision, together with the Administration's proposal to provide funds directly to metropolitan transportation agencies for the first time, will remain in the bill which both Houses finally approve. Certain other features of the present Senate and House bills are much less desirable, but I hope that these can be eliminated, the strong features retained, and a sound bill sent to my desk for signature before the Congress adjourns.
>
> Now that BART is demonstrating how pleasant and convenient movement within our urban centers can be, we should be less disposed than ever to be patient with how congested and difficult it all too often is. The speedy resolution of America's chronic and worsening traffic jams is far too urgent a matter to be stalled any longer by legislative or bureaucratic logjams, and I will continue my own determined efforts to keep it moving ahead.

(A week later, on October 2, the computer-controlled brakes on one of BART's trains malfunctioned, resulting in the train passing the end of the tracks and plunging down an embankment. The incident injured five people and raised concerns about the computerized controls intended to keep the trains and their passengers safe on the BART system and the other new rapid rail lines under construction in other areas. [Turner, Wallace, "5 on Bay Area Train Hurt as Automated Brakes Fail," *The New York Times*, October 3, 1972; Hartlaub, Peter, *San Francisco Chroncle*, http://blog.sfgate.com/thebigevent/2012/08/16/rail-to-the-chief-when-nixon-rode-bart/.])

On September 14, 1972, *The New York Times* contained the latest in Mobil Oil's advertisements on transportation issues. The headline on this one was unusually blunt coming from an element of the "highway lobby":

LET'S END THE HIGHWAY TRUST FUND

"While America has developed a superb highway system through Highway Trust Fund revenues," the ad began, "our mass transit has slipped sadly." Mobil had been urging Congress to develop ways of improving mass transit and "re-examine the desirability of the Highway Trust Fund":

> We doubt whether such special earmarked funds represent sound public policy. Experts in public finance have historically opposed trust-fund financing because this mechanism mandates decisionmaking and priority-setting by a bureaucracy with its own direction and momentum, without the proper annual review of proposed expenditures.

We could not afford to simply divert Highway Trust Fund revenues to mass transit:

> Robbing Peter to pay Paul by diverting revenues from the Fund will give us the worst of both worlds—poor highways and poor mass transit. We cannot afford either.

Under the current system, the ad pointed out, "highway-building has dominated federal transportation policy," in part because of the disparity in matching share. "From the states' viewpoint, it's just plain cheaper to ignore mass transit and simply build highways."

Transportation decisionmaking should not be "an either/or situation." By phasing out the Highway Trust Fund, Congress could "make appropriations at the federal level for an adequate, integrated transportation system." Simply doing "what we have had for the past 50 years" was not the answer:

> We must innovate, and we must look ahead as far as advanced technology can take us in meeting both present and future transportation needs.

The ad concluded:

> We are convinced that this can be achieved only through a National Master Transportation Program, financed both by existing gasoline taxes that would go into the general coffers and by annual appropriations large enough to do the job. A sound first step would be to end the Highway Trust Fund.

Not all highway interests shared Mobil Oil's sentiments. Robert W. Furtick, chairman of the board of the American Trucking Associations told a conference of the National Association of Shipper-Motor Carriers that the effort to siphon $800 million from the Highway Trust Fund for mass transit was being channeled through the Highway Action Coalition:

> I believe that this antihighway sentiment and this fervor to latch onto highway taxes is a much more serious threat than has been generally recognized within the highway community.

Chairman Hartke of the Senate Commerce Committee's Surface Transportation Subcommittee agreed the Federal-aid highway program was "under attack," with transit interests thinking they had better uses for "the idle funds" in the Highway Trust Fund. He vowed to "work to block" the diversion, saying, "we need to complete the job that has been planned and worked on for so long.

["Highway Trust Fund Diversion Fight Continues," *The Journal of Commerce*, September 15, 1972]

The Senate began considering the Federal-Aid Highway Act of 1972 on September 13, including Title III ("Urban Mass Transportation Act of 1964") as approved by the Committee on Banking, Housing and Urban Affairs. When the bill was entered into the record, Senator Robert C. Byrd (D-WV) asked unanimous consent that after disposing of all amendments to S. 3939 that were called up on this date, further debate would be delayed until the next week, with amendments then limited to the Cooper-Muskie and Kennedy-Weicker amendments. Senator Byrd said he had cleared his request with all Senators involved in the matter. The request was adopted. [*Congressional Record-Senate*, September 13, 1972, p. 30480]

Much of the bill's time on the Senate floor consisted of going through each of its provisions as approved by the Committee on Public Works. When Section 121 amending the Highway Beautification Act came up, Senator Cooper offered an amendment to remove the 2-year moratorium that Secretary Volpe had cited in his August 18 letter. Cooper recalled that Congress had been wrestling with control of outdoor advertising since 1958, when the Federal-Aid Highway Act of 1958 provided a Federal-aid funding bonus to States that entered into an agreement to control the erection and maintenance of outdoor advertising signs, displays, and devices in areas adjacent to the Interstate System. The 1965 Highway Beautification Act, he said, had been "ineffective because the States were slow to enact the necessary legislation and Congress . . . failed to provide funds to the States for the payment of the just compensation required by that act" for removal of signs erected legally under State law.

Now, S. 3939 was proposing a moratorium on removing directional signs:

> The argument is made that certain "directional" signs, such as those which point out restaurants, hotels, and motels, service stations, and similar facilities are of interest to the traveling public.

The idea was that the moratorium "will help small roadside businesses, small tourist motels, and small gasoline stations," but Senator Cooper said it would have the opposite result. "It will work to the advantage of the largest businesses, franchised chains, oil companies, and the large sign companies which have great capital resources." He pointed out that the Federal-Aid Highway Act of 1970 had established a Commission on Highway Beautification that had not yet submitted its findings; action on control of outdoor advertising should be postponed until the commission completed its work.

Senator Buckley of New York said he and Senator Baker of Tennessee had introduced the measure:

> Its purpose is not to delay progress on the removal of the signs, but rather to provide the time within which the Commission on Highway Beautification can complete its hearings and make final report to the Congress to carry out the final policy on sign removal.

> I might add that this provision which would be stricken by the amendment of the Senator from Kentucky was introduced at the specific recommendation of the Commission on Highway Beautification, of which I am a member, following some extensive hearings in which it was determined that to carry through on the removal of all signs which are addressed to tourists and travelers on our highways would be a disservice to those same travelers.

Before all such signs were removed, he said, "we should have the full benefit of these extensive hearings."

After further debate, the Senate rejected Senator Cooper's amendment, 31 to 44. [*Congressional Record-Senate*, September 13, 1972, p. 30491-30495]

One of the longest debates concerned Section 147 freeing the U.S. 281/North Expressway from any Federal restrictions. Senator Buckley introduced an amendment to strike the provision:

> This section would be the first step in involving the Congress in an endless round of specific adjudications over whether this highway or that dam or this canal should be exempted from compliance with Federal environmental statutes. It would thrust the Congress into the realm of the courts [and] into the adjudication of sharply contested specific disputes.
>
> We would be faced, as we are here, with serious factual questions raised by the parties to the dispute but with no satisfactory means to resolve them . . . . It would be the beginning of a whittling away of the strong and important safeguards incorporated into statutes such as NEPA.

Senator Bentsen opposed Senator Buckley's amendment. "The question is whether we are going to give equity to the people of San Antonio who have made a very major investment of their money in this project." They had, he said, $15 million at stake. This was not an environmental issue:

> We have 323 acres involved . . . . We are talking about a road that cuts across 4 acres of a golf course at the corner of Brackenridge Park. And across 5 acres that were already isolated on the golf course.

It was a $20 million project with only $1.8 million coming from the Federal-aid highway program. The State simply wanted to return the Federal funds so it could proceed without Federal restrictions such as Section 4(f) that had been enacted after work on the project had begun.

As for the concern about precedence, "I went back and redrafted this amendment to be sure that it was localized and applied only to San Antonio." The provision would not establish a precedent for projects begun after NEPA and Section 4(f):

> So let the people of San Antonio exercise their will. Let them pay their way. Let them use self-determination. They love their parks; they are concerned about the beauty of their city.

Senator Nelson, one of the Senate's leading environmentalists, was unconvinced. "What concerns me is that there is an attempt by all kinds of agencies to avoid the requirements of the Environmental Protection Act." Senator Randolph countered that, "I feel that we in no way do violence to the environmental program of this country in reference to the project which is incorporated in this legislation."

The Senate voted against Senator Buckley's amendment, 24 to 49. [*Congressional Record-Senate*, September 13, 1972, p. 30496-30503]

As provided for in Senator Byrd's unanimous consent request, the mass transit issues were postponed to the following week.

The day before the Senate was to debate the transit provision, an editorial in *The Washington Post* endorsed the Cooper-Muskie amendment:

> Measured against the massive transportation snarls of urban areas and the mammoth pro-highway bias of past federal policies, the Cooper-Muskie amendment is a very modest advance. Permitting cities to use the highway trust fund to build rails as well as roads is not an improper diversion of the funds, much less a perversion of any sacred trust. To the contrary, truly balanced transportation systems benefit highway users as much as bus riders and subway strap-hangers. Indeed, those who *must* use the roads . . . have an especially direct interest in curbing highway congestion by offering people other ways to get from place to place.

The editorial favored a mix of roads, rails, bike paths, and pedestrian ways that each community could select to meet its own needs. The Cooper-Muskie amendment, "while limited, is an important and attainable beginning toward that end." ["Roads <u>and</u> Rails for the Cities," *The Washington Post*, September 18, 1972. Emphasis in original]

On Tuesday, September 19, the Senate resumed debate on the Federal-Aid Highway Act of 1972. Senator Weicker began by introducing an amendment to modify State planning. This was not, he said, a funding measure since Section 104(g) of Title 23, United States Code, already allocated one-half of 1 percent of Federal-aid funding to the States for planning:

> This amendment would simply mandate the pass through of one-half of these funds to urban areas while the remaining funds would remain with State transportation planning agencies . . . . Local officials would definitely be consulted by State planners and local plans, created locally would be carefully plugged into broader State programs. The kind of coordination this amendment requires is absolutely essential . . . .

He explained:

> Mr. President, this amendment is very simple. It says that any highway construction project funded with Federal money must be part of an overall transportation plan rather than simply

> a highway plan. It also says that the Governor has ultimate responsibility for such planning and not just State highway officials.
>
> This amendment is important because it recognizes that highways, while a vitally important part of any balanced transportation system, should not be planned in isolation from mass, intercity rail or air transportation facilities. All should tie in with each other. All should recognize the varying environmental, social, and economic impact of alternate modes of transportation in all areas—rural as well as urban.

Without further discussion, Senators Randolph and Cooper indicated they supported Senator Weicker's amendment and it was adopted without a recorded vote. [*Congressional Record-Senate*, September 19, 1972, p. 31238-31329]

Senator Kennedy then introduced amendment no. 1482, otherwise known as the Kennedy-Weicker amendment, that would allow States to use $2.3 billion of Highway Trust Fund revenue for mass transit. After mentioning that the Public Works Committee had rejected the amendment, Senator Kennedy put it in context:

> A satellite photo of the United States traces narrow black ribbons that criss-cross over mountains, around valleys, and through cities. The neat lines seem to represent a carefully designed orderly arrangement attesting to human intelligence and ingenuity.
>
> Unfortunately, up close the rationality of the photo is distorted. For up close, we are aware that our transportation system is in crisis, we are aware that 55,000 homes are displaced by freeways each year. We are aware that two-thirds of our urban land area has been given over to the auto and its alleys, highways, and parking lots.

He quoted from DOT's national transportation policy statement, which he said "was not pollyannish in the remotest sense":

> On the whole, the transportation which has evolved, both consciously and unconsciously, represents an uneven fabric ill suited to today's needs, and is, itself, a major contributor to the problems facing transportation today.

He summarized the purpose of the amendment to correct these deficiencies:

> It does authorize cities and States to use noninterstate funds, specifically the primary system allocation, the secondary system allocation, the urban system allocation, for the acquisition and construction of rail facilities and equipment in addition to the other uses authorized by the committee. This would open some $2.3 billion to the trust fund for this purpose if States so desire.
>
> Thus, it would permit States and localities to find their own answers to the transportation puzzle in their communities and to develop a transportation plan to meet those problems, free from the lure of easy trust fund dollars if they pick highways.

Given that mass transit received only one-tenth as much as highways through Federal programs, "it is about time," he said.

Having said what the amendment would do, Senator Kennedy explained what it would not do. It did not affect the Interstate System. It did not alter the amount of Federal-aid highway funds any State would receive. It would not mandate a single dollar for urban rail mass transit. Finally, it did not diminish the amount available under the Urban Mass Transportation Assistance Act of 1970:

> The amendment we propose merely seeks to offer to States and cities an option in resolving their transportation problems that they do not now have.

Senator Weicker took to the floor to discuss the environmental impacts of highways. It took a while, he said, for "the man on the street" to realize that the soot in his eye, the murkiness of rivers and streams, and such abominations as smog, litter, heat inversions, oil spills, wildlife slaughter, and shattering noises fell under the broad term "environment." The times had changed "because today the environment is everything." He continued:

> For too long I had hoped to see a similar awakening with respect to the Nation's transportation problems. Sad to say it has not happened. Why?
>
> Because it has been creeping rather than instantaneous catastrophe.

Transportation, he said, is a city losing a park to an expressway, an old man dying of respiratory disease, 55,000 people dying in their cars, a business being torn down, and the poor without cars being unable to get to work. "So, when we realize what transportation is, we understand that the fight for an intelligent, balanced transportation policy is a fight . . . all about life."

He concluded:

> The choice, as I see it, is between moving America on for 2 more years—since this is a biennial review—or getting killed by fumes, or cars, or just waiting.
>
> I am reminded of the parable of how not to "cook a frog." If we were to boil a pot of water and drop the frog in, his reflexes would cause him to jump out of the pot, thus saving him from being cooked. On the other hand, put him in a pot of cold water, heat it slowly, and he would eventually be cooked.
>
> In terms of transportation in this Nation, we are the frog—and we had better jump.

Although Senator Bayh had moved from Public Works to the Senate Appropriations Committee, Senator Randolph asked him to talk about the Subcommittee on Roads' hearings. Senator Bayh opposed the Kennedy-Weicker amendment for several reasons. First, he said:

> I think a grave legal question can be raised as long as we presently have that Federal highway commitment under the Revenue Act of 1956 as to whether we can suddenly take

> funds that are paid in gasoline taxes pursuant to the 1956 act—to be used for programs related to highways—and use it in the rail system that the Senators would make possible under their amendment.

Second, given the Nation's mass transit needs, he was concerned that if Highway Trust Fund revenues were used as proposed, some of their congressional colleagues might decide that mass transit no longer needed general revenue.

He thought the approach taken by the subcommittee in allowing $800 million in funds that could be used at State option for bus-related transit was appropriate. Any Federal-aid highway funding used for bus-related transit "frees that much money from the urban mass transit program—taken from the general fund—which can go into the type of rail system which the two Senators are desirous of funding out of the highway fund."

Senator Cooper, noting that his Cooper-Muskie amendment was pending, said he believed "we should limit the highway trust funds available for rail mass transit to those funds which are allocated to the urban system as defined in the Highway Act[,] that is, to systems in areas of 50,000 or more population." If Congress thought more funds were needed, Congress should increase funding for the Federal-aid urban system.

Senator Randolph began his remarks by quoting from a letter that he and Senator Cooper had received from Secretary Volpe:

> The Kennedy-Weicker proposal would make every noninterstate highway program, primary and secondary as well as urban, eligible for financing rail rapid transit. Such a step could in some States lead to the diversion of primary-secondary highway funds into subway construction in our major cities, a step not conducive to a balanced transportation system.

Senator Randolph rejected the notion that the transportation system was in the terrible shape depicted by Senators Kennedy and Weicker. He agreed that problems existed, but "I think it is also necessary to say that there are today in this country millions and millions of persons who are moving, in any 24-hour period, by means of motor vehicles of one type or another." The Public Works Committee's bill offered a balanced approach that "reinforces the belief of the committee that the highway program and public transportation are inseparable."

As for Secretary Volpe's observation that funds authorized for rural highways could be used for subways, Senator Randolph said, "The basic fairness of such an approach obviously must be questioned." He also questioned whether such a sweeping change in the use of Highway Trust Fund revenues as proposed by the Kennedy-Weicker amendment could be made without changes in the authorizing revenue act.

He agreed that mass transit needs were substantial, but "it is important to remember that the issue we face in providing a balance [sic] transportation system is not one of highways or mass transit." The bill provided resources that could be used for urban mass transit, but "urban highway needs also are great and we must retain the available resources also to provide these roadways so that they, too, may serve as part of the public transportation system."

In view of the concern about the legality of using Highway Trust Fund revenues for mass transit without amending the Highway Revenue Act, Senator Kennedy introduced a letter dated September 19, 1972, from Robert F. Keller, Deputy Comptroller General of the United States. Keller said that the amendment would do what it was drafted to do. The short letter, however, did not offer any explanation of the legal theory behind it.

The Senate rejected the Kennedy-Weicker amendment, 18 to 60. [*Congressional Record-Senate*, September 19, 1972, p. 31237-31247]

Senator Cooper introduced amendment no. 1512, the Cooper-Muskie amendment that allowed Federal-aid urban systems funds to be used for mass transit, including rail. Senator Muskie began the discussion of the amendment by praising the Federal-Aid Highway Act of 1972 drafted by the Public Works Committee. However, the roads financed out of the bill would be in use at least into the 1990s. "For that reason, we must assure that the options available and the programs which can be supported under the legislation we consider today will be relevant to the transportation needs and priorities which this Nation will face in the decades ahead.

He cited several reasons why the situation was even more urgent now than in 1970 when he had proposed to broaden the use of Highway Trust Fund revenue for mass transportation, including rail systems. The existing program had encouraged proliferating suburban sprawl and other questionable land uses, as well as a high cost of car ownership that left society's left-outs at a disadvantage. Auto-related air pollution was hazardous to health, while the looming energy crisis (to be discussed later) would severely reduce private auto use. Congestion severely hindered personal transportation and delivery of goods.

The Public Works Committee addressed these concerns by allowing $800 million in Federal-aid urban system funds to be used for highway-related transit, with a minimum of $300 million that must be used for highway-related transit. However, "none can be spent for rail transit." This response "is not sufficient to meet our transportation crises and assure proper evaluation of all-options to the present highway program." The rail option, as permitted by the Cooper-Muskie amendment, must be available.

Senator Muskie concluded his initial remarks by saying:

> Transportation systems to a great extent determine the economic and social structure of a community. The Federal Government should thus avoid imposing any particular transportation system on a community. I have always believed that people at the local level most often know what is best for themselves. The program we propose will allow local citizens to decide for themselves what transportation system is best for their communities and their future . . . .

> [The amendment] has broad, bipartisan support. It applies only to the urban system aspect of the highway program that is before us. It involves only $800 million as against several times that figure which would still be available for highway construction.
>
> This is a reasonable step in the direction of using funds for nonhighway transportation objects.
>
> I urge my colleagues to support it. If they do so, they will make a significant contribution to a redirection of our transportation priorities in the next decades and in a direction related to public interest, the need of the disadvantages, the need of the poor, the need for public health, and the need for cities struggling under the impact of problems, so many of which are related to the automobile and automobile related factors. [*Congressional Record-Senate*, September 19, 1972, p. 31250-31252]

Several Senators spoke in support of the amendment. Senator Williams was among them. The Interstate System built over the past 15 years was, he said, "the finest in the world." However, in today's "dynamic, highly urbanized society, a different type of transportation is of the utmost necessity—urban mass transportation." The $3.1 billion authorized for mass transit in 1970 was helpful but insufficient to the need for "efficient, socially worthwhile mass transit systems." Clearly, he said, "changes in the operation of the highway trust funds are long overdue."

He discussed the actions of the Committee on Banking, Housing and Urban Affairs, including its support for the Cooper-Muskie amendment. In broadening the Highway Trust Fund to include public transportation, "it makes sense to include all forms of urban mass transportation and not only buses." He addressed the key question head-on:

> The only question which remains is, Why should automobile and truck owners pay for mass transportation?
>
> Many of these people feel that their money should go for highways, not buses and trains.
>
> The answer to that is simple: we are all in the same traffic jam together and what helps the urban commuter also helps the trucker and the car owner.
>
> Therefore, if we are willing to move forward and adopt the Cooper-Muskie amendment, we can replace our present traffic jams with efficient urban mass transportation systems which will make travel easier and more pleasant and which will help all of our Nation's citizens. [*Congressional Record-Senate*, September 13, 1972, p. 31256-31257]

Senator Randolph explained that "with some regret" he had to oppose the amendment. He recalled his comments during the debate on the Kennedy-Weicker amendment about why he opposed allowing highway funds to be used for rail transit systems. "The provisions of the Cooper-Muskie amendment would, if adopted, dilute out ability to tailor the highway program to respond to the transit needs of the great majority of American communities." He did not doubt the sincerity of Senators Cooper and Muskie:

> On this occasion, however, I fear that they are overresponding [sic] to one need with an answer that may compromise our ability to cope with the total problem of public mass transit.

He also questioned the legality of the amendment in view of Section 209(f)(1) of the Highway Revenue Act of 1956 ("Amounts in the trust fund shall be available for making expenditures which are attributed to Federal-aid highways"). The Administration bill, he noted, had proposed an amendment to address this legal restriction. Further, he introduced a letter from Chairman Mills of the House Ways and Means Committee, the committee which had drafted the Highway Revenue Act in 1956, to Chairman Blatnik of the Public Works Committee:

> I agree completely with the observations which you made concerning the fact that diversion of money from the Highway Trust Fund for mass transit purposes as indicated in the amendment . . . would clearly be a violation of the provisions of section 209 of the Highway Revenue Act of 1956, as amended. I agree with you completely, and I am sure, if I understand the feeling of the members of the Committee on Ways and Means, that the majority of the Committee Members would agree with me that this is clearly a matter within the jurisdiction of the Committee on Ways and Means and formal action would have to be taken by our Committee before any such diversion could be accomplished.

Senator Muskie responded to the question of legality. He said that the Public Works Committee's bill would permit Federal-aid funds to be used to purchase buses and build passenger-loading areas and bus lanes. "Thus, we are merely adding with our amendment another purchase, which is just as much in keeping with the overall intent of the proposed legislation." He continued:

> In addition, Mr. President, the committee's proposed section 142(c) states that the purposes authorized under (a) of section 142 shall be considered as "highway projects." That clearly would obviate any need to amend any other legislation. All we need to do is to label this a "highway project."

He also again cited Keller's letter to demonstrate that the question of law had been addressed. [*Congressional Record-Senate*, September 19, 1972, p. 31258-31259]

Senator Cooper said that Senator Muskie's answer to the objections "was equal to any that I have heard." He also introduced the complete September 18 letter from Secretary Volpe that had been cited during the debate on the Kennedy-Weicker amendment. Secretary Volpe had said he considered adoption of the Cooper-Muskie amendment "of utmost importance." Increased funding for the Federal-aid urban system and its use for highway-related mass transit as in the current bill were steps in the right direction, but the Cooper-Muskie amendment would take this movement one step further. Secretary Volpe continued:

> We believe that it is essential that we strike a balance between our urban transportation needs and our rural transportation needs. It is our considered opinion that the Cooper-Muskie amendment would strike this balance. It would provide the flexibility so sorely

> needed in our major urban centers while at the same time insuring the continuation of our very important and very necessary primary and secondary highway programs.

Senator Cooper then addressed the concern about "tapping the trust fund." He said:

> There is only one trust that I recognize. Each one of us on the floor should recognize that that is the legislative trust that was imposed on each of us in our election to this body. Otherwise why not create a range of trust funds—a trust fund for the military, a trust fund for pollution, a trust fund for agriculture, and on down the line—so that we never have to use either our imagination or creativity nor be held responsible for the consequences.
>
> To my way of thinking, there is no question as to what trust is important today. It is that legislative trust which is thrust upon each one of us.

Senator Weicker asked to speak. He said that shortly after the Kennedy-Weicker amendment was defeated, a member of his staff was going back to the Senate Office Building:

> The highway people traveling in the (congressional shuttle) subway were gleeful over the fact that they had won so overwhelmingly. But these are the last of the highway lobbyists. No longer does the highway trust fund have all of its members. Only recently some of them said "Let us end the highway trust fund." Henry Ford said, "Let us use the money from the highway trust fund for mass transit." The Mobil Oil Co., in a series of advertisements in the New York Times says: "Open up the fund. We need balance, coordination, sanity."
>
> Slowly but surely everyone in the country is moving ahead but the U.S. Senate. We have been clinging to the highway trust fund. Today the Senate can change the emphasis toward mass transportation.

Highways alone, he said, "or in overwhelming proportions, are a mobility, environmental and safety disaster":

> How do we answer the fact that the landscape is being paved over with concrete, all in the name of the God of Mobility, but still no mobility is achieved?
>
> I think it is important that this body maintain our fiscal integrity and maintain the integrity of this program. However, much more important, I think, is that we fulfill our objectives and our objectives and loyalty are not to this highway trust fund. Our loyalties are to the people of this country and their mobility and to the fact that they can live, to the fact that they can breathe, and to the fact that they can move.
>
> That is what I am here for, not to defend a fiction. [*Congressional Record-Senate*, September 19, 1972, p. 31260-31262]

Senator Kennedy also supported the Cooper-Muskie amendment. It was more limited than the rejected Kennedy-Weicker amendment, "but it does mark a beginning." At least it would permit "urban areas to make the choice between highways and rail transit." Today, cities had no choice if they want to receive their portion of the Highway Trust Fund. "They can accept their allocations and build highways or they receive nothing." The lack of choice forced cities "to tilt their transportation planning toward more autos and more highways, knowing full well that they are merely putting off the day of reckoning." The Cooper-Muskie amendment would move the country "in the direction that all observers of the transportation scene desire, in the direction of a balanced and integrated transportation system." [*Congressional Record-Senate*, September 19, 1972, p. 31263]

After a few more Senators spoke in support of the bill, the Senate voted to adopt the Cooper-Muskie amendment, 48 to 26. Senator Randolph was among those voting against the amendment. An article in *The New York Times* about the vote said that, "Opposition to the Cooper-Muskie proposal has been highly visible in the cloakrooms and offices [of the Senate] over the last few weeks, but it was muted on the Senate floor today." [Rosenbaum, David E., "Senate Votes Transit Aid From Fund for Highways," *The New York Times*, September 20, 1972]

Soon after this key vote, the Senate adopted the Federal-Aid Highway Act of 1972, as amended, 77 to 0. The approved bill included not only the Cooper-Muskie amendment but Title III providing general Treasury revenue for operating subsidies and $3 billion for urban transportation. [*Congressional Record-Senate*, September 19, 1972, p. 31266-31268]

Secretary Volpe issued a statement commending the Senate "for the significant and historic action it took today in approving a Federal-Aid Highway Act that for the first time allows both rail and bus mass transit – as well as highways – to be financed by the Highway Trust Fund." The legislation, he said, "provides funds for the challenges of today and tomorrow." He explained:

> Transportation, no matter what its mode, is not an either/or proposition, and such thinking can only lead us into an ever deepening urban morass. We need all modes of transportation in some of our cities and we need meaningful alternatives in all of our cities. This bill provides for these alternatives by giving local, state and regional leaders the flexibility they need to attack the problems which are making our urbanized areas uninhabitable.

He added that he had "just talked to President Nixon" who was "very pleased with the Senate passage of the Cooper-Muskie amendment." They urged the House to incorporate the amendment into their version of the legislation. "Our transportation system must be as dynamic as our society." He was certain that House members understood this "and will respond in an affirmative manner."

The historic vote to open the Highway Trust Fund to rail transit was the leading point in coverage of the Senate's adoption of the 1972 Act. An editorial in *The New York Times* called the Cooper-Muskie amendment "a modest proposal," but added that "since highway interests in Congress until recently were resisting the diversion of road construction money even for such closely related purposes as highway safety and beautification, this victory for other forms of transportation represents a decided achievement." The editorial lamented failure of the Kennedy-Weicker amendment, as did an editorial in *The Baltimore Sun*, which speculated that if the amendment had passed, the funds it freed for mass transit, along with the UMTA and State matching funds, "would have put the country on the road toward balanced transportation at last."

The St. Louis Post-Dispatch began its editorial by saying, "For the first time one house of Congress has decided that the highway trust fund is not a sacred trust for more and more pavements, but may be used for balanced transportation—meaning mass transit." The *Chicago Tribune* observed that, "The Senate finally has recognized that highways alone, despite the propaganda of the powerful highway lobby, cannot solve the problem of moving people in congested cities and suburbs." It recommended that the Highway Trust Fund be transformed into a Transportation Trust Fund to help provide "a balanced transportation system in our urban areas rather than face the prospect of sinking under the weight of concrete ribbons."

The Philadelphia Inquirer also praised the "historic step." It said:

> Sixteen years of over-emphasis on highways and under-emphasis on mass transit has left American cities a legacy of traffic congestion and antiquated, inadequate public transportation. It's time to put some badly needed flexibility into federal policy so that highway and mass transit facilities can be balanced in accord with local need.

["Transit Breakthrough," *The New York Times*; "A Boost for Mass Transit," *The Baltimore Sun*; "Senate Takes Historic Step: Highway Funds for Transit," *The Philadelphia Inquirer*; all September 21, 1972; "Not Highways Alone," *St. Louis Post-Dispatch*, September 22, 1972; and "Highways and Better Ways," *The Chicago Tribune*, both September 23, 1972]

On September 25, Secretary Volpe was in Seattle to address the 91st annual meeting of the American Transit Association. He emphasized the changes that had occurred under the Nixon Administration:

> Prior to 1969 mass transit was strictly a back burner program in Washington. UMTA had a Spartan staff, a shoestring budget, and no continuity of funding.
>
> Today public transportation is a billion dollar item in the Federal budget . . . . The Urban Mass Transportation Assistance Act of 1970 laid the fiscal foundations for a 12-year program. And for more than a year now we have been trying to broaden the base for public transportation financing.

He cited the origins of the American Transit Association:

> Seventy years ago – or even 90 years ago, when this Association was in its infancy – we needed public transit in America because not everyone could afford a car. Today we need it because nearly everyone <u>CAN</u> afford a car. So now it is our challenge to make transit competitive <u>WITH</u> the car.

The Administration, he said, had been "aggressively <u>PRO</u> public transportation" because "President Nixon is vitally concerned with the future of America's cities – and he knows, as you do, that 'step one' in the quest for cities that work is the creation of cities in which people, goods and ideas move freely and efficiently." The steps thus far were "just the <u>FIRST CHAPTERS</u>."

He cited progress in Seattle (the "Blue Streak" Demonstration Project), Atlanta (MARTA), San Francisco (BART), and in smaller cities such as Salt Lake City:

> It has consistently been our view that keeping transit wheels turning is <u>NOT ENOUGH</u>. We must move in new directions, turn to new ideas, and devote more resources and resourcefulness to improving the <u>FUNCTION</u> of public transportation as well as its facilities.

In this regard, the Senate had taken "historic action" just 6 days earlier in approving the Cooper-Muskie amendment:

> I would remind you that the 1972 Federal-Aid Highway Act not only provides flexibility to local and State officials to select that mode – or mix of modes – that will help solve their total transportation problem; it does it in such a way that it does not interfere with or lessen the amounts currently available for the Interstate, primary, secondary, or rural roads.

As he concluded his speech, Secretary Volpe said that, "highways are essential," adding:

> Without our highways, public transportation by bus could not exist or grow. Without President Eisenhower's foresight in launching the Interstate program and President Eisenhower's commitment to its completion, our roadway system would be hopelessly constricted, dangerously out-of-date, and totally inadequate to our growing needs.

Today, the debate "must not revolve around the relative merits of roads or rails, steel wheels or rubber tires, personal rapid transit or public mass transit." The central problem was how to improve "the people-moving capacity our cities must have to service the seventies and remain mobile in the eighties." That was why President Nixon believed the House should join the Senate "in voting to support urban public transportation needs through highway user revenues." In this week, which was officially designated National Highway Week, Secretary Volpe said he could bring "no better news for highway user and transit rider alike – than our pledge of continuing commitment to the cause of better public transportation throughout America."

As focus shifted to the House of Representatives, *The Wall Street Journal* began its article on diversion:

> This week is National Highway Week, and it could be celebrated by breaking open the Highway Trust Fund to help mass-transit systems.
>
> And that would mean less emphasis on highways.
>
> Whatever happens on this score in Congress this session, the momentum for using the trust fund to support transit is certain to increase. So much so, avers one Nixon administration

> official, that starting next year the administration's "modest proposal" for diverting some trust-fund money to transit "may fall by the wayside—the pressures will mount to open the trust fund all the way.

Nixon Administration "Congress-watchers" thought that "their chances on winning on the House floor, while much less solid than in the Senate, are still reasonably good":

> If the trust fund diversion can be pulled off, a Transportation Department official says, "This will be the most important thing we've done in this department in the first four years" of the Nixon Administration.

Pro-transit forces had clearly gained support on Capitol Hill, and felt confident that any provisions that were not approved this year would face better prospects in the next Congress:

> Some suggest this might come about, for example, by both highway and transit interests agreeing to support a boost in the four-cent-a-gallon federal motor-fuel tax, thereby providing a bigger pot for both roadbuilding and transit work. Another more modest proposal for fattening the trust fund is a tax on transit systems that could yield perhaps $100 million yearly, relieving some of the pressure on the gas tax. Right now, the move to raid the trust fund on behalf of both rail and bus transit is coming in the face of substantial opposition by most elements of the highway lobby, but with the backing of environment-oriented, antiroad organizations like the Highway Action Coalition, a combination of 19 groups including Environmental Action and the Sierra Club. [Karr, Albert R., "Diversion of Road Funds to Mass Transit Seen Having Good Chance on House Floor," *The Wall Street Journal*, September 25, 1972]

Now, the time had come for action by the House of Representatives.

The House Rules Committee

While the House Committee on Public Works was completing work on its version of the bill, EPA Administrator William D. Ruckelshaus was in Detroit for a speech to the American Automobile Association. He began by acknowledging that all Americans wanted a car but said the problem was that 75 percent of them succeeded in acquiring one:

> Winston Churchill once said in a characteristic fit of hyperbole that the worst disaster in the history of mankind was the invention of the automobile. The people do not seem to agree.

"The very popularity of the automobile," he said, "now seriously threatens its usefulness." Our cities were "confronted by pollution, congestion, noise, delay, ugliness and urban breakdown on a scale that has not been seen since the last days of imperial Rome."

The Clean Air Amendments of 1970 imposed air quality deadlines that cities would have to meet by 1975, but the vehicle itself would have to be improved in unknown ways to control emissions. The auto industry claimed it could not meet the required 90-percent reduction in hydrocarbon and carbon monoxide levels by 1975 and a 90-percent reduction in nitrogen oxides by 1976. At present, "exhaust emission controls cannot do the job by themselves where traffic volumes are too great or atmospheric conditions are unfavorable." Changes in the way the vehicles are used were likely:

> We will be hearing more about metered traffic, exclusive bus lanes, restricted parking, dispersed employment, and sanctions against the man who drives his six-passenger car to work with no one else in it.
>
> Statistics now show that the rate of occupancy of cars during peak load periods is down to 1.2 persons per vehicle and—at the present rate of passenger decline—by 1980, one out of every three cars will be tooling along without a driver.
>
> That wouldn't be much more absurd than the present practice of encasing one man in 5,000 pounds of steel, adding 400 horsepower and then making him creep along at 5 m.p.h. breathing a combination of synergistic poisons.

Some thought we should build more highways, others that we should eliminate automobiles from congested areas and replace them with mass transit. Because the "automobile is part of the larger mosaic of American life," he said that his "profound belief is that attempting to solve the problems of modern living by attacking a piece of that complex is wrong because it's shortsighted." He said:

> We desperately need a broad systems approach integrating emissions control of motor vehicles with highway planning, land and energy use, resource conservation, demographic factors, economic growth, and the protection of wilderness and countryside. We need transportation that is fast, safe, reliable and ecologically responsible.

He asked how the country can "get around the energy-resources-pollution-urban design impasse?" The answer "obviously" was to employ mass transit "like housing and the utility infrastructure—as a major element in the design of more efficient cities." The systems should be more attractive, with features such as air conditioning, express service, quiet low emission engines, flexible routes, courteous service, and "seating arrangements which recognize the importance of 'personal space.'" Such service would open suburban jobs to inner city residents who could not afford a car.

The automobile was here to stay, but "we must supplement it if we are to get the most efficient service out of it. Henry Ford himself has said so." Ruckelshaus mentioned such innovations as automated people-movers, dial-a-bus service, air-cushion trains powered by linear-induction motors:

> Overall, according to the Department of Transportation, the revolution in mobility will require as much as $33 billion in the next 10 to 20 years. Some of this money may be diverted from the highway trust fund; whatever its origins it will be well spent. We don't have to go from one place to another in ways that are time-consuming, wasteful of fuel, nerve-wracking or socially destructive.

As alternatives, he suggested changing to a 4-day work week or allowing employees to work from home:

> Above all, in discussing the future of the private car we must not fall into the trap of being mere participants in endless pro-versus anti-automobile debate. We need not be either to be pro-humanity.
>
> The open road is no longer simply an invitation to adventure but also a problem and a challenge. We have it within our power to create a kind of mobility which transcends movement for its own sake or movement compelled by circumstances. We can formulate a life style which guarantees the variable mobility a complex society requires. [Ruckelshaus, William D., "Living With The Auto," *The Los Angeles Times*, September 26, 1972]

On September 21, Representative Glenn M. Anderson (D-Ca.), a lifelong resident of Los Angeles, asked the House Committee on Public Works, which was nearing completion of its Federal-Aid Highway Act of 1972, to approve a provision similar to the Senate's mass transit section. The committee's rejection of the amendment, 10 to 26, was not a surprise given the members' longstanding support for highways. In a concession, the committee approved an amendment calling on the Secretary of Transportation to report to Congress on the country's public transportation needs.

As David Rosenbaum of *The New York Times* reported in his article about the defeat, some mass transit proponents "were encouraged because 10 members of the committee were willing to have the trust fund tapped to build public transportation systems." He added:

> The Nixon Administration is solidly behind the idea of letting urban areas use part of their trust fund money for mass transit purposes, and Administration lobbying in the Senate was said to have been instrumental in having the measure adopted there.
>
> In a rare alliance, the Administration has joined forces with the Democratic Study Group, an organization of liberal Democratic Representatives, to work to overturn the committee's decision on the floor.

Still, the highway forces were strong:

> Most of the members of the Public Works Committee are strong advocates of expanding the Federal highway system, and, in an election year, many of them have benefited from contributions by highway interests . . . . [Also] there are few Representatives who have not taken credit for new highways in their districts. Many of these legislators do not want to see the highway money siphoned off for other uses.

One of those legislators was one of the most influential:

> Representative Wilbur D. Mills, Democrat of Arkansas, has said that he believes that any legislation changing the use of trust fund money should go through his Ways and Means

Committee, which has jurisdiction over tax legislation. [Rosenbaum, David E., "House Panel Backs Ban on Diverting Highway Funds," *The New York Times*, September 22, 1972]

The committee completed work on its bill on September 25. It contained Title I ("Federal-Aid Highway Act of 1972"), Title II ("Highway Safety Act of 1972"), and Title III ("Prohibition of Discrimination on the Basis of Sex"). Its Declaration of Policy stated that after completion of the Interstate System, national policy would be to increase emphasis on improving the other Federal-aid systems to the maximum extent possible by 1990. [*Federal-Aid Highway Act of 1972*, Report, House of Representatives, 92d Congress, 2d Session, Report No. 92-1443, September 25, 1972]

The bill's provision on highway public transportation authorized the use of Federal-aid highway system funds for highway-related transit, including exclusive bus lanes and passenger loading areas and facilities, but not purchase of buses. If right-of-way were available, rail or nonhighway mass transit programs could be accommodated. The bill would repeal the provision of the 1970 Act that required exclusive bus lane projects to be less expensive and more feasible or prudent than additional automobile lanes.

As noted earlier, the committee bill also called on the Secretary of Transportation to cooperate with the Governors and appropriate local officials to evaluate the estimated $63.45 billion in public mass transportation needs through 1990 as discussed in the 1972 National Transportation Report. Funding for the $75 million study would come from the general Treasury. The report to Congress on the evaluation would cover:

(1) Refining the public mass transportation needs contained in such Report.
(2) Developing a program to accomplish the needs of each urban area for public mass transportation.
(3) Analyzing the existing funding capability of Federal, State and local governments for meeting such needs.
(4) Analyzing other funding capabilities of Federal, State and local governments for meeting such needs.
(5) Determining the operating and maintenance costs relating to the public mass transportation system.
(6) Determining and comparing fare structures of all public mass transportation systems.

This study, the committee believed, "would enable communities to develop actual programming to meet its public mass transportation needs whatever that form might be." After receiving the report in January 1974, "it is hoped that a proper look can be given to the need, if it may be necessary, to use any portion of the highway trust fund and other methods of financing to meet the pressing needs of mass transit (exclusive of highways) across the country." [*1972 Act*, House Report, p. 12, 18]

The committee's bill also contained such provisions as:

- Authorized an additional $8 billion for completion of the Interstate System ($3.5 billion a year for FYs 1974-1978 and $2.5 billion for FY 1979). The time for completion was extended to June 30, 1979.

- The bill approved use of the 1972 Interstate Cost Estimate for apportionment of Interstate funds as well as an additional $50 million for States that would otherwise receive less than one-half of one percent of the Interstate apportionment in FYs 1974 and 1975 if the State had not completed Federal funding of the System within its borders.
- Authorizations for other Federal-aid programs for each of FYs 1974 and 1975:

  Federal-aid primary in rural areas - $700 million
  Federal-aid urban - $700 million
  Federal-aid secondary in rural areas - $400 million
  Extensions of primary and secondary systems in urban areas - $400 million
  Forest highways - $33 million
  Public lands highways - $16 million

- Declared the national policy to be reduction of red tape to the maximum extent possible.
- Terminated Federal-aid involvement in the U.S. 281 North Expressway project in San Antonio. A related provision on the "Federal-State Relationship" explained that nothing in Title 23 shall infringe on the sovereign rights of the States to determine which projects are to be federally financed. It added that Title 23 provided for a federally-assisted State program.
- Extended the possible use of Certification Acceptance to all Federal-aid systems except the Interstate System.
- If an Interstate toll road became toll free, Interstate funds could be used for construction, reconstruction, and improvement of the road.
- Since the Commission on Highway Beautification established by the 1970 Act had not met its deadline, the bill extended the deadline to December 31, 1973, the year before the next 2-year reauthorization bill was due for consideration. The bill eliminated the present 660-foot limitation on the control of signs along the Interstate and primary systems. It changed the definition of "effective control" to state that signs beyond 660 feet would be limited to directional and official signs and notices related to motorist services. It also contained changed provisions on acquisition of signs to be removed and authorized $50 million a year for these purposes, as well as $15 million for control of junkyards. The funds would come from the Highway Trust Fund.
- Continued funding for Economic Growth Center Development Highways and authorized funds for a Special Urban High Density Traffic Program (for highways connected to the Interstates) and Priority Primary Routes (not more than 10,000 miles of high traffic sections of highways on the Federal-aid primary system connected to the Interstate System and built to Interstate standards). The Priority Primary Routes were essentially former Administrator Turner's "Junior Interstates" proposal.)
- Directed the Secretary to undertake a National Scenic Highway System Study and submit a report to Congress by January 1, 1975.
- Eliminated the 200-mile limitation on Howard-Cramer mileage, leaving the amount open-ended. Provided that substitute mileage and mileage for modification shall not exceed the cost (as shown in the 1972, rather than the 1968, Interstate Cost Estimate) of the aggregate of all mileage that is to be withdrawn from the Interstate System as nonessential. In considering substitute routes, the Secretary would give "preference, along with due regard

> for interstate highway type needs on a nationwide basis," to routes in States in which other routes were or hereafter are withdrawn and extension of routes which terminate in cities served by a single Interstate route, so as to provide traffic service through such cities. [*1972 Act*, House Report, p. 19-40]

The Highway Safety Act of 1972 included funding, primarily but not entirely from the Highway Trust Fund, for such activities as rail-highway crossings, bridge reconstruction and replacement, pavement marking, projects for high hazard locations, and elimination of roadside obstacles, as well as research and education. [*1972 Act*, House Report, p. 41-43]

Title III prohibited discrimination based on gender in any program or activity receiving funds under Title 23 programs.

The committee report on the bill included minority views on several topics. Representatives Abzug and Anderson joined Representatives James V. Stanton (D-Oh.), James R. Grover, Jr. (R-NY), Charles B, Rangel (D-NY), and George W. Collins (D-Il.) in offering their views on "Interstate System Transfers and Substitutes." Although they appreciated the sevenfold increase in funding for the Federal-aid urban system, "the bill does little to advance public transportation." They acknowledged the bill's changes in the Howard-Cramer amendment, but did not think it went far enough:

> We would amend the bill to allow Interstate funds to be used for non-Interstate purposes when an Interstate segment is to be deleted from the System and the responsible State and local officials jointly determine that this would be a better use of these funds. However, in no way would this amendment undermine the integrity of the System since no deletion could be made without the Secretary of Transportation first determining that the segment to be deleted was not essential to System continuity.
>
> Our amendment would require the Governor and appropriate local officials to jointly request that an Interstate segment be deleted. The Secretary of Transportation could only approve this request if he determines that the segment in question is not essential for the continuity of the System.
>
> Funds equaling the cost of the deleted segment as of the date of its withdrawal would be available for alternative Interstate segments or for projects on the Federal-aid urban system in the urbanized area in which the deleted segment was located. Thus for the first time, Interstate funds could be used for non-Interstate purposes.

They added that they saw no reason why "transportation capacity must be provided through an eight-lane limited access facility rather than through seven or eight separate upgradings of poorly designed existing streets or for that matter improved public transportation." At present, a city seeking additional capacity "must accept it the only way it is offered, as an Interstate highway segment." Under the proposed amendment, officials could select a different Interstate routing or several improved lesser facilities. [*1972 Act*, House Report, p. 73-74]

Representative Robert A. Roe (D-NJ) joined in their minority view on "Public Transportation." They endorsed the rejected amendment that would allow a portion of Highway Trust Fund revenue to be used to acquire and construct facilities and equipment for bus and rail public transportation. The provision would permit, not require, these options. "The point is that those who are most familiar with an area and its needs would be permitted flexibility in developing a transportation program." Getting people out of their cars would also benefit the trucking and business community by reducing congestion while helping alleviate air pollution and the oil crisis. They indicated they would offer the amendment when the bill came up for consideration on the House floor. [*1972 Act*, House Report, p. 76-79]

Representatives Jim Wright and Gray of Illinois joined Representatives Anderson, Abzug, Collins, Rangel, and Roe in expressing disappointment that the bicycle transportation amendment had been rejected. The amendment would have allowed Federal-aid to help States and localities construct bicycle and pedestrian paths and associated features such as bicycle shelters and traffic control devices in conjunction with highway rights-of-way. Allowing this use would have helped alleviate traffic congestion and auto pollution and provide "a healthy recreational activity as well." Apportioned Federal-aid highway funds could have been used for bicycle-related work, but the amendment would have added $10 million a year for FYs 1974 and 1975 specifically for this purpose. The amendment would not have affected city sidewalks, which were a local responsibility, but "would help meet the pressing needs of the ever growing army (80 million persons) of bike riders—both young and old—who enjoy commuting to work or school, and who enjoy the wholesome, healthy recreation of bicycling." [*1972 Act*, House Report, p. 75]

Representative Abzug individually opposed the priority primary concept as a second generation Interstate System. The new program would take away from the flexibility needed in determining transportation alternatives:

> We do not need another such system. What is now required are funds to best meet the different needs found in different States. If additional highways are needed, we should provide the funds but the States should decide how to use them. [*1972 Act*, House Report, p. 82]

On September 14, the House Banking and Currency Committee had completed work on its version of the omnibus housing and urban development bill the Senate had approved in March. The bill included a 2-year appropriation of $400 million—half the amount in the Senate bill—to cover operating deficits for transit systems. The prospects for passage on the House floor in the few weeks remaining were dimmed by other controversial provisions, including restrictions on Federal efforts to open the suburbs to minorities. *The New York Times* said the bill "was seen as progressive in its attempt to reform the grand system and aid the large cities in their development but sharply regressive in social content, moving against efforts of the Federal Government for an integrated, open society and for assistance to the poor." [Herbers, John, "House Unit Backs Housing Measure," *The New York Times*, September 15, 1972]

On September 27, the House Rules Committee voted 9 to 5 on September 27 to defer action on the legislation, effectively killing it. As *The Wall Street Journal* explained, the bill "had drawn fire both from liberals, who opposed restrictions on subsidized housing projects, and conservatives, who disliked the subsidies for mass transit systems and the continuation of any subsidized housing programs." Another sticking point was that "the size of the massive 314-page bill offended practically everyone, including the chairman of the Banking Committee, Wright Patman (D., Texas)." The House and Senate banking committees were reported to be working on continuing resolutions to fund current housing programs to continue funding in FY 1973 for the Department of Housing and Urban Development, Federal Housing Administration, and the Veterans Administration. ["House Rules Unit Kills Housing Bill With Transit Aid," *The Wall Street Journal*, September 28, 1972]

With a little more than a week before the Federal-Aid Highway Act of 1972 would reach the House floor, the debate over diversion continued. The American Trucking Associations' Furtick denounced the Senate bill in a speech to the Central Motor Freight Association in Chicago. The industry was willing to pay its fair share, he said, but "that is not what the Senate and others are asking of us. They are asking us to pay considerably more than our fair share," referring to the use of Highway Trust Fund revenue for mass transit. ["Mass Transit Use of Road Fund Hit," *The Journal of Commerce*, September 29, 1972]

Secretary Volpe again "most enthusiastically" supported the Cooper-Muskie amendment in a statement issued on September 29. "I become increasingly optimistic that similar legislation will be approved by the House of Representatives." The amendment was "moderate and limited" in scope, but would allow Federal officials "to work with these cities to help them meet their needs."

The change, moreover, "is completely consistent with the evolving history of the Federal aid highway program," as he explained:

> Over the years new uses for the Highway Trust Funds have been introduced. Today we see these funds being used for replacement housing, construction of exclusive bus lanes, parking facilities, safety programs, even ferryboats. I do not, consequently, see any conflict in the use of these funds for buses or rail purposes. The principal beneficiaries of this new program would be highway users themselves who would see lessening of highway congestion as more and more drivers took advantage of new or improved transit.
>
> The old way of Federal financing dictated that State and local officials must build highways – whether or not they needed them.
>
> The new way we recommend permits these same officials to make the wisest possible transportation investment with their Federal assistance. This new way, it seems to me, is in the best tradition of representative government.

The statement was accompanied by a Question and Answer section. One question was, "But how can you expect people who pay into the Highway Trust Fund to agree to this?" The answer:

> Virtually all Americans are highway users in one way or another. Either they use vehicles for private use or they obtain their basic goods from trucks that use those roads. They use it

> for business as well as pleasure. But the point is that congestion cannot be solved merely by building roads. We must make use of all forms of mass transit or in reality these tax dollars will not buy very much in the way of better transportation.

Another question asked if the Cooper-Muskie amendment was "unfair to truckers who pay the most taxes only to see some of the money going to mass transit which is of no benefit to truckers at all." The answer:

> The truth of the matter is that truckers will most certainly benefit. They compete with the private motorist in the highly congested urban areas. It has been estimated, for example, that the annual cost of congestion to truckers in New York City alone is more than $100 million. Our proposals are designed to help remove many of the private automobiles from streets so that all vehicles can operate more effectively. Truckers surely would not like one alternative that has been suggested – restricting truck use in urban areas to non-rush hours and even nighttime.

That same day, September 29, Secretary Volpe addressed State transportation officials gathered at Friendship International Airport in Maryland to discuss traditional and innovative approaches to transportation planning, organization, and financing. The Secretary told the assembled officials that he endorsed the Cooper-Muskie amendment in the Senate bill. It would not change the highway-orientation of the Federal-aid primary and secondary systems, but would allow urban officials to decide the best way to address their unique transportation needs. Among the beneficiaries would be motorists who would face less congestion as more drivers switch to transit. ["Volpe Promises Funds for Rail Transit System," *The Baltimore Sun*, September 30, 1972; "Volpe Supports Highway Aid Act," *The Journal of Commerce*, October 2, 1972]

(On November 16, 1973, Friendship was renamed Baltimore-Washington International Airport to reflect its regional role. In 2005, it was renamed Baltimore/Washington International Thurgood Marshall Airport (BWI) to honor the achievements and the legacy of Supreme Court Justice Thurgood Marshall, who was born and raised in Baltimore.)

At the start of a panel discussion, Under Secretary Beggs said of the Cooper-Muskie amendment:

> Although scaled down from our original request of $1 billion for urban transportation, the Bill as passed by the Senate would provide that flexibility in solving urban transportation problems we believe essential. It would bring funding and responsibility closer together.

He explained that success on the Senate floor followed defeat in committee:

> If we are to win this one, we will have to have a repeat performance of the minor miracle of overturning a powerful committee recommendation. The House Subcommittee on Roads and the full House Public Works Committee have by convincing margins voted against the use of Highway Trust Fund money to support transit systems other than bus-related highway facilities.

Whatever the outcome, he said, the "momentum for meeting transportation challenges on a systems basis grows." The Nixon Administration had shown "a willingness to go the extra mile in cooperating with you to solve your transportation problems and to help you meet your challenges."

On October 3, Secretary Volpe issued another statement in support of the Cooper-Muskie amendment. Thanks to the Highway Trust Fund, he said, "the United States has the most advanced and best transportation system in the world." He continued:

> The great emphasis we have placed upon highway construction for the past 16 years has been, rightly or wrongly, a major contributing factor to the urbanization of America. We are today a more complex society and that complexity is nowhere more evident than in the area of transportation.
>
> But the quality of mobility has become flawed in many of our urban areas. It is in the effort to restore mobility in our cities that we urge Congress to approve use of the Highway Trust fund for public transportation in urban areas . . . . Returning political philosophy and initiative to the original concept of the Highway Trust Fund – increased mobility – will give us that flexibility we need.

He praised the Senate for adopting the Cooper-Muskie amendment:

> Under the leadership of Representative John B. Anderson, a similar amendment providing $700 million to the Highway Bill will be introduced in the House of Representatives.
>
> In the interest of preserving the quality of mobility in our urban areas – the economic viability of our cities – I urge favorable consideration of the Anderson amendment.

The statement was accompanied by "Facts About the Highway Trust Fund" highlighting the many diversions from highway construction already approved. It included three recommendations for changes to House bill, which it described as "very much a traditional highway bill." Of course, the first recommendation was adoption of the Cooper-Muskie amendment. Second, Secretary Volpe said the House bill provided all Federal-aid urban system funds (increased from $100 million at present to $700 million a year) to the State highway departments. He endorsed an amendment that would allocate the funds proportionately among urbanized areas of 50,000 population or more:

> If a duly constituted metropolitan transportation agency were established, the funds would go directly to them. If no such agency existed, the State would administer the funds for use only in the designated urban area.

Finally, he endorsed an amendment on "Interstate Transfers." Current statutes allowed the Secretary to delete segments that were not essential for the continuity of the Interstate System. Deletions would free funds for use elsewhere, but the statutory mileage limitation on the length of the System was a limiting factor. The additional 200 miles currently available under the Howard-Cramer Act helped offset the limitation. "This additional mileage has the effect of permitting funds tied up in a relatively expensive short urban segment to be used for a much longer rural segment."

The House bill eliminated the 200-mile addition and authorized whatever additional mileage was needed. The Secretary favored an amendment that would remove the 200-mile ceiling but "would permit the funds earmarked for a deleted Interstate segment to be added to the Federal-aid urban system funds of the urban areas in which the deleted segment was located." The funds could then be used for any activity that was eligible for urban system funds. The statement did not say so, but approval of this amendment coupled with the Cooper-Muskie amendment would mean that the former Interstate funds could be used for transit, including rail transit.

The statement opposed the bill's 2-year moratorium on billboard removal, funding for priority primary routes, and provisions involving freeway construction in the District of Columbia.

The New York Times endorsed House approval of the Cooper-Muskie amendment. The editorial recognized that amending the bill in the House "will not be easy, given the extraordinary power of the highway lobby." It praised Secretary Volpe for campaigning hard for the amendment and President Nixon for supporting it. "If it fails, the fault will not be that of the Administration but of the Democratic leadership of the House." ["Roads—Or Rail?" *The New York Times*, October 3, 1972]

James D. Dilts, who covered transportation for *The Baltimore Sun*, tried to set the stage for the coming battle. His Sunday feature article began:

> In the annals of legislation, 1972 could be remembered as the year the first concentrated attack was mounted on the Highway Trust Fund.

The battle would be over the Cooper-Muskie amendment, which had been approved by the Senate with the support of Secretary Volpe and the Highway Action Coalition. Dilts summarized the evolution of the legislation, noting Secretary Volpe's testimony in support of the Single Urban Fund, which "was never heard of again, and did not emerge in either Senate or House versions of the highway bill."

On one side of the debate was HUFSAM, the federation of highway corporations. HUFSAM's Koltnow said, "Some of the proponents [of diverting highway funds into mass transit] are less concerned about the real needs of transit than they are annoyed by the highway program."

On the other side was the Highway Action Coalition. Dilts helped his readers understand the contrast between the antagonists. The coalition, he explained, consisted of the same groups that had defeated the SST. They had reformed a year earlier with a new target: the Highway Trust Fund. The coalition's offices were on the seventh floor of the Dupont Circle Building "which seems to be sort of a commercial Chelsea Hotel and in a similar state of physical decay." He added that, "A lot of people run around the halls with guitars." (The Chelsea Hotel in New York City was known for the artists, musicians, and writers who stayed there.) The current campaign consisted of "legislative lobbying and mailing out literature, piles of which consume most of the space in the office."

He introduced readers to John D. Kramer, who had taken a leave of absence from a fellowship in international relations at Oxford to run the coalition for $75 a week. Kramer headed a staff of four and operated on a budget of $15,000 a year. "Neither he nor anyone else on the staff has been paid in a month." Asked about the source of funding for the coalition, Kramer told Dilts, "That's the problem. We don't have one."

Dilts also visited "the plush offices" of HUFSAM a block away on the fifth floor of 1776 Massachusetts Avenue. "The federation is conducting a public information campaign and media blitz on the need for more highways." With a budget of $3 million a year, HUFSAM employed a staff of 50. Koltnow said:

> The transit case has been misstated. This illusion of a fat highway trust fund is a bunch of grapes that has been dangled in front of interested folks on the other side. The needs of highways have always outstripped the revenues. I defy you to find me a street you are satisfied with as far as safety and looks are concerned.

He added that, "We have no paid lobbyists on the hill," although Kramer claimed that HUFSAM lobbied anyway.

Both groups were focused on the House. Kramer told Dilts, "There is an awful lot of tricky maneuvering going on." [Dilts, James D., "Trying to Crack the Highway Fund," *The Baltimore Sun*, October 1, 1972]

Engineering News-Record also tried to give its readers a sense of the debate. The 1972 Act would be "one of the final, and most controversial bills Congress will handle before adjourning for the fall campaign." When the House passed its bill, "no doubt there will be a battle royal when conferees meet soon to work out differences."

Of course, the Cooper-Muskie amendment would be the chief battleground. In addition to the usual disagreements over rail transit, the article saw other problems:

> A potential complication that mitigates [sic] against the transit diversion was brought up by Rep. Wilbur Mills (D-Ark.). He says that any such change in authorization would require a change in revenue collection laws, an almost impossible legislative hurdle since Congress wants to adjourn soon . . . .
>
> Some sources consider it likely that President Nixon may veto any highway bill that calls for more than $6 billion in annual funding. ["Battle Shapes Up on Highway Fund Diversion," *Engineering News-Record*, September 28, 1972, p. 21]

Despite rejection by the House Public Works Committee of the Cooper-Muskie amendment, the Department of Transportation and mass transit supporters thought their intensive campaign had gained enough support to pass on the House floor. However, before the Federal-Aid Highway Act of 1972 could reach the House floor, it had to go through the House Rules Committee, which would determine which amendments would be out of order. In other words, any such amendment was not considered germane to the legislation.

The Rules Committee had outlawed amendments to alter several sections, including the U.S. 281 North Expressway provision. On October 3, Representative John A. Anderson (R-Il.) of the Rules Committee tried to convince his colleagues to send the bill to the House floor with a rule allowing consideration of the Cooper-Muskie amendment. The committee voted 7 to 8 to reject Anderson's proposal. All the Republicans except Anderson voted against his plan, while six Democrats favored it and two voted against it. This action meant that if the Cooper-Muskie amendment were introduced during the floor debate, it would be ruled out of order and not brought to a vote—as had been the case when the House refused to allow consideration of transit measures during consideration of highway bills in 1968 and 1970.

The vote led to partisan finger pointing. Liberal Democrats from urban areas blamed the Nixon Administration for not securing the needed votes to pass the Anderson plan out of the Rules Committee. Administration officials explained that President Nixon had written to Anderson on September 30 to offer unqualified support for the plan. "I consider it of the utmost importance that the House act to provide more flexibility in the use of the Highway Trust Fund for urban transportation projects—either highways or transit—along the same lines as those on which the Senate has acted." The President acknowledged the House bill's support for highway-oriented mass transit, but "urban areas must have the flexibility to design, and fund, a balanced system." He endorsed the Cooper-Muskie amendment as "the kind of flexibility we need today and that is why I am so pleased you will be offering your amendment."

Secretary Volpe had called nearly every member of the Rules Committee, and after the vote, had called Republicans again in hopes of convincing them to change their vote. They criticized Speaker of the House Carl Albert (D-Ok.) and Majority Leader Hale Boggs, who had refused requests that they help secure approval. The Minority Leader, Representative Gerald R. Ford (R-Mi.) had also refused to help.

What the Rules Committee's decision meant for the bill was unclear. Some officials thought it killed any chance of enacting a Federal-aid highway bill in 1972. The Administration, however, still planned to fight for the bill and thought it had a chance. ["Rules Panel Blocks House Vote on Nixon Plan to Let Urban Areas Use Road Funds for Mass Transit," *The New York Times*, October 4, 1972; "Providing for Consideration of H.R. 16656, Federal-Aid Highway Act of 1972," *Congressional Record-House*, October 5, 1972, p. 34066-34067]

On Thursday, October 5, the House began considering the bill. That morning, an editorial in *The Los Angeles Times* decried the House Rules Committee's action. The present restriction of the Highway Trust Fund to highways "no longer makes sense in light of environmental considerations and the crying need in many urban communities for a balanced transportation system including fast, efficient mass transit." The key House committees were still under the grip of the highway lobby, the editorial stated, but the Highway Action Coalition was convinced it had the votes to approve the Cooper-Muskie amendment if it came to a vote before the full House. "Barring a miracle, the drive to change the law is dead for this year" following the Rules Committee's action. Fortunately, "it is highly unlikely that the corpse will stay buried." Eventually, "common sense will prevail even in the U.S. House of Representatives." ["Another Setback for Mass Transit," *The Los Angeles Times*, October 5, 1972]

That same day, *The Journal of Commerce* reported that the International Brotherhood of Teamsters had broken with longstanding policy to support the use of Highway Trust Funds for mass transit. "It's simply a realization of the fact that highways alone can't do the job." The Teamsters, who had been influential in other battles in support of highways, said they would throw their lobbying support behind the Cooper-Muskie amendment because it would help relieve congestion on the streets and highways the truckers used. ["Teamsters Back Use of Road Fund For Mass Transit," *The Journal of Commerce*, October 5, 1972]

In the House, the first order of business was to adopt the House Rules Committee's resolution 1145 on the bill. Representative H. Allen Smith (R-Ca.) of the Rules Committee said he expected some controversy about the rule, especially regarding the use of Highway Trust Fund revenue for mass transit. He explained that the committee had considered Anderson's plan, but voted it down. On October 4, Representative Anderson had made a motion to reconsider, but it also had failed. He knew that several Representatives, including Anderson, had written an all-Members letters stating they would like to secure a vote on the Cooper-Muskie amendment. He could not speak for the Speaker or Parliamentarian, but he expected they would rule the amendment non-germane, consistent with the House Rules Committee vote. He added:

> Frankly, I am personally very much opposed to taking any of that money and diverting it and using that money for any type of mass transit. If they want to start a trust fund for that particular purpose, then they should start their own trust fund for that purpose. Because once you start going into trust funds, diverting them, you will have more and more and more problems.

He recommended support for the House Rules Committee resolution. [*Congressional Record-House*, October 5, 1972, p. 34064-34065]

Representative Anderson spoke in support of allowing a vote on his version of the Cooper-Muskie amendment. He said:

> Up until 11 o'clock this morning I had been assured that our amendment would be germane. At that time I was informed that new points had been raised, and that we were in a new ball game.

He explained why the Cooper-Muskie amendment was needed, citing support from Secretary Volpe and President Nixon. [*Congressional Record-House*, October 5, 1972, p. 34065-34067]

Members of the Public Works Committee who had signed the minority report also spoke in support of the amendment, with Representative Stanton, a Democrat, saying, "The minority leader has worked hard to make sure that the will of this body is not properly identified on this vote, in my judgment. I criticize him and those who seek that position."

Minority Leader Ford responded briefly that he had "asked that the Rules Committee abide by the rules of the House, and that is the proper procedure in any legislative body." He added, "To do otherwise would create uncertainty and legislative chaos."

Stanton replied sarcastically, "I agree, and the intense interest of the minority leader to abide by those rules is to thwart the free will of this body to make a decision on the mass transit needs of America." The Minority Leader asked Stanton to yield time for a response, but Stanton would not. He continued that he was seeking a vote "that is critical to the communities of America." [*Congressional Record-House*, October 5, 1972, p. 34067]

Representative Bingham, who had been subject to points of order in past efforts to secure Highway Trust Fund revenue for transit, spoke in favor of amending the rule to allow a vote on the Cooper-Muskie amendment. As a representative of New York City, "I feel very bitter about the way in which my constituents and other big city residents have been discriminated against over the years in the allocation of Federal funds for transportation purposes." He wanted to make two points. First, he pointed out that the National Board of the Governors' Conference supported the principle behind the amendment by supporting a Transportation Trust Fund consisting of existing earmarked transportation revenues or "beginning a phased program of percentage transfers from the highway and aviation trust funds and other funds made available for transportation into the proposed unified National Transportation Trust Fund." He said that the Governors' policy statement, as well as the Democratic Party's platform, which called for broadening the Highway Trust Fund to include mass transit, went further than the Cooper-Muskie amendment.

Second, he said he favored the germaneness rule in general. "Let us not frustrate ourselves, let us not paralyze ourselves, by a rigid application of the germaneness rule so that this issue cannot be voted on the merits." He did not want anyone to say that the House would have approved, or at least voted on, the Cooper-Muskie amendment "if we followed some other procedure." There was, he said, "simply no other procedure." He added, "I have been fighting this battle since 1965, and I know." [*Congressional Record-House*, October 5, 1972, p. 34068]

Representative John Byrnes (R-Wi.) brought up Secretary Volpe's statement in February 1969 when he said, "I believe that the integrity of the highway trust fund must be preserved without question . . . . In my opinion, to divert highway use tax revenues to purposes other than the provision of highways would abrogate a long-standing moral commitment, as well as a statutory provision." Byrnes thought the Secretary's comment was right on point. "Are we going to break faith with what we did in 1956 . . . .?" He quoted President Eisenhower in 1956:

> A sound Federal highway program, I believe, can and should stand on its own feet, with highway users providing the total dollars necessary for improvements and new construction.

Now, Byrnes asked, are we going to say to taxpayers that after making a firm commitment on how highway user tax revenue would be used, "we have decided we are going to use this money for any purpose that comes along that suits our desire at the moment." To do so would be to "break faith with those who pay these taxes." [*Congressional Record-House*, October 5, 1972, p. 34068-34069]

Representative Abzug said she thought House members had the right to hear arguments on both sides of the issue, especially since there was no other legislation where mass transit could be discussed:

> It is interesting that last week the Committee on Rules killed a housing bill which contained money not only for capital expenditures involving mass transportation but also for operating expenses for local transit agencies.
>
> I think this amendment is perfectly germane to the highway legislation and it is the only legislation to which it is germane. The fact of the matter is that the present subject matter of the legislation does encompass facts concerning mass transit, such as the construction of bus lanes, bus shelters, and fringe area parking . . . . We are merely asking that an amendment to the Highway Act be considered on the floor. The Committee on Rules has no right to make a substantive determination that we cannot discuss the relationship of mass transit to the highway trust fund. [*Congressional Record-House*, October 5, 1972, p. 34069]

After brief comments by Representative Koch in support of voting on the issue, Minority Leader Ford took the floor. He said that those who favored the amendment "would leave you with the impression that the Congress is not providing one penny for urban mass transit." He summarized funding in the mass transportation act. Now, he said, they want that funding, plus they "want to break faith with the trust fund." He said, "let me put this issue as clearly as I can." Do the Representatives think that the people paying taxes for construction of highways want that money diverted to fixed rail facilities and the purchase of passenger equipment? "Of course they do not. They do not want you to break faith with them, and if you vote 'no' [on the resolution] . . . you will."

Proponents spoke of the Cooper-Muskie amendment "as though this is a very simple, innocuous amendment," when they were just using the old "nose under the tent" theory. "If you open the door a wee crack, you are going to have the floodgates opened." Once Congress breaks faith on the Highway Trust Fund, those same proponents, Ford said, would want funds from the airport trust fund. He urged support for the House Rules resolution. [*Congressional Record-House*, October 5, 1972, p. 34069-34070]

Representative Wright said he supported mass transit, but wanted to explain the three reasons why the Committee on Public Works had considered the Cooper-Muskie amendment "very unwise." First was the breach of trust. Congress should no more break faith with the highway user taxpayers "than we would want to violate the social security trust fund." Second, every penny in the Highway Trust Fund was needed for highways, as documented in the 1972 transportation needs report. Third, the Public Works Committee had worked within the framework of the trust to the taxpaying public "to assist and accommodate the development of mass transit wherever it is needed and can be used." He cited the provision allowing the use of highway right-of-way for mass transit facilities as well as the provisions for fringe parking and preferential bus lanes. [*Congressional Record-House*, October 5, 1972, p. 34071]

Representative Harsha said that all the Rules Committee was asking the House to do was "abide by the rules we enacted some time ago." If non-germane subjects were considered on every bill "you will find yourselves legislating in a circus." The Rules Committee was not denying the House the right to vote on this issue if legislation were reported out of the committee with jurisdiction over this subject. "Then it can be brought before the House in a proper manner and dealt with according to the rules of the House."

He emphasized that Highway Trust Fund revenue was needed for highways. "By diverting even one penny from this highway improvement effort we are, in effect, endangering the lives of the people who travel on the Nation's roads." With 55,000 people already losing their lives on the roads, he said, "Let us not set the stage for killing many more."

If the Administration thought mass transit was so urgent, Representative Harsha asked, why had the Administration impounded $300 million of that money the previous year? Further, the General Revenue Sharing bill was awaiting passage, and that would provide more funds that communities could use for mass transit. "Now, how much do they want? What they really want, I think, is to have the operating costs of mass transit systems paid for by Federal funds." The Cooper-Muskie amendment would be "the foot in the door" that would allow "this mass transit special interest . . . to get money to operate the system, keep the fares low and thus have automobile owners subsidize the subway riders."

Allowing consideration of the amendment would violate the fiduciary responsibility of Congress. "Its word must be good. If it votes down the previous question and makes the rule open to amendment it will be saying 'Our word is no good, our promises are no good.'" Congress had given its word in creating the Highway Trust Fund and must not go back on it. [*Congressional Record-House*, October 5, 1972, p. 34072]

Representative Blatnik followed Representative Harsha by saying modestly "that I had a very small role to play over the years on the highway program which has been so ably handled by the former chairman of the committee, George Fallon, who is here on the floor of the House this afternoon, and the subcommittee chairman, the gentleman from Illinois (Mr. Kluczynski) and the able staff of the committee." He agreed with the arguments for mass transit. They are "absolutely justified." However, he also was aware of needs in rural areas where mass transit could not be the solution. "There is not enough money in the trust fund and you are never going to solve the problem by what is being attempted here—no one is going to solve these problems in this way." He favored identifying needs and providing funds to meet them. Congress "should not in the process take the moneys from other programs where they are equally needed." [*Congressional Record-House*, October 5, 1972, p. 34072]

Representative Thomas P. "Tip" O'Neill (D-Ma.), whose district in Boston included a portion of the controversial Inner Belt, spoke in support of Representative Anderson's request. Representatives from Boston, such as himself, and other urban areas should have the opportunity to vote on the Cooper-Muskie amendment. As a member of the Rules Committee, he had tried to waive the point of order on this amendment, but the majority had voted to deprive "millions of citizens in urban areas of improved public transportation systems." Allowing the Rules Committee resolution to control the debate "would insure that the metropolitan areas of America would continue to be torn by controversies which have immobilized efforts to achieve truly balanced transportation systems so desperately needed by all our citizens." [*Congressional Record-House*, October 5, 1972]

When the debate was concluded, the House voted 200 to 168 in support of the Rules Committee resolution. They would not vote on Representative Anderson's attempt to incorporate the Cooper-Muskie amendment into the Federal-Aid Highway Act of 1972. [*Congressional Record-House*, October 5, 1972, p. 34075-34076]

The Washington Post gave Minority Leader Ford much of the credit for the vote. His "strong speech of opposition" to modifying the resolution "lined up nearly two-thirds of the Republicans against it despite the President's support." The article noted that as Representative Anderson had said during the debate, the House Parliamentarian had assured him and his cosponsors that their amendment to consider their version of the Cooper-Muskie amendment would be ruled in order. On October 5, "they said they were told just the opposite, that it would be ruled out of order." Instead of debating the merits of their amendment, they had to fight on a procedural motion to change the House Rules Committee resolution. "It is usually more difficult to win a procedural fight than a substantive one." [Lyons, Richard L., "House Kills Bid to Open Road Fund," *The Washington Post*, October 6, 1972]

John Kramer and other mass transit supporters were angered by the maneuvering to prevent a vote on the issue. Kramer said, "This parliamentary maneuver insures that the highway lobby will continue to have a firm grip over America's transportation dollars and that millions of citizens in urban areas will be deprived of the quality public transportation service they deserve." ["Mass-Transit Use of Highway Fund Blocked by House," *The Wall Street Journal*, October 6, 1972]

Albert R. Karr wrote about the defeat in *The Wall Street Journal* on October 10. His article was titled "The Highway Boys Win Another One." He began with an anecdote about a man from Peoria who worked for the Caterpillar Tractor Company. While in Washington, he tried to find The Highway Lobby in the telephone directory. When he couldn't find it, he doubted its existence. Karr continued:

> Here's news for the man from Peoria. The highway lobby exists. It's in Washington—big as life, vigorous and fresh from one of its greatest victories.

After explaining the debate over the House Rules Committee resolution, he pointed out that it was "remotely possible" that the highway lobby might still lose if a House-Senate conference committee included the Cooper-Muskie amendment in the final bill. "Even so, the effort it has mounted in recent weeks would still be impressive." He summarized some of its efforts:

> One anti-highway man counted nearly 30 highway lobbyists working the corridors of Capitol Hill as the House proposal headed toward a vote recently. Moreover, a contractors group, the Committee for Action, already has reported contributing $74.400 in recent

> months to more than 60 political candidates. The contributions include $1,500 to Sen. Jennings Randolph . . . and $1,000 to John S. Blatnik . . . .
>
> So far, the Truck Operators Non-Partisan Committee has reported no donations. But if the rumors of recent donations proffered to House members during the recent debate are any indication, the truckers won't be sitting on their money for long.
>
> On at least two occasions in recent days, the truckers were reported offering campaign-contributions checks to members of House committees as key votes approached on the highway measure. When the House public works panel was to register its stand on the trust-fund diversion plan (it wound up rejecting the plan 26-10), some of the trucker offers amounted to "a couple thousand dollars at a crack," says an observer. "They pulled out all the stops . . . ."
>
> Later, more trucker offers were made when the rules committee took up a parliamentary question vital to passage of the bill. The highway lobbyists wanted the committee to rule that any amendment from the House floor to tap the trust fund for mass transportation would be out of order. The committee ruled accordingly.

The lobbyists, Karr said, were satisfied with their efforts until they learned that the Administration had convinced the House parliamentarian to overrule the committee:

> So the highway men went to work again. The House parliamentarian was instructed to uphold the point of order.

The House rejection of the Cooper-Muskie amendment in committee and on the floor during the debate on points of order had been "a major defeat for Mr. Volpe." He had supported the Cooper-Muskie amendment, rather than the more dramatic Kennedy-Weicker amendment, and now the prospects for either were dim. In supporting the more modest amendment, the Administration had "worked hard to persuade pro-highway members of Congress that the administration isn't out to sabotage the trust fund, just to relieve urban congestion and alleviate such environmental problems as air pollution." Another factor was at play as well. Secretary Volpe had been warning highway interests the week before that if the highway lobby did not support the relatively modest Cooper-Muskie amendment, they would only "encourage the extremists who want to abolish the trust fund altogether."

As for the Administration's Single Urban Fund, Karr found that:

> [W]hen the administration's pro-transit proposal came to its House test this year, the pro-highway lobbyists were working against it much harder than the pro-transit advocates were working for it. The transit interests apparently decided in advance that the administration proposal was a lost cause this year.

Now attention would turn to the conference committee, which would have to reach agreement on a single bill, and that was not certain with only a week to go in the session. The "sometimes-heavy hand of the lobby" was expected to be evident when the conference meets to work out differences:

> And the lobby may do very well, partly because the conference committee itself will, in effect, be stacked in its favor. The House members on the committee will be flatly opposed to aiding mass transit, and some of the Senators on it are more pro-highway than the Senate as a whole.

If the provision in the Senate bill did not survive the House-Senate conference committee, "the prospects of a veto of the entire bill by President Nixon are very real," according to an unnamed Transportation Department official.

Mass transit advocates thought that if the bill died with the end of the 92nd Congress, they would fare better in 1973. With some pro-highway members retiring and others subject to tough re-elections in November, the Rules Committee might be more favorable. An unnamed administration man told Karr, "I think we're going to see increasing pressure for that." He called the highway lobby's impressive effort in recent weeks "a dying gasp."

Pro-transit interests might face defeat in 1972, but "are optimistic over the long haul." The public, influenced by environmental and urban-oriented groups, was calling for less emphasis on highways, with Mayors and Governors supporting the transition. Karr pointed out that even some traditional highway supporters, such as the Teamsters Union, Mobil Oil, and the National Automobile Dealers Association were calling for change. The Administration, if President Nixon were reelected, was reportedly planning to push again for a formula similar to the one rejected by the House.

While these trends were clear, another was less clear. "The [highway] lobby already has lost much of its clout in the Senate." The Public Works Committee's close vote turning down the Cooper-Muskie amendment after Senator Stafford switched his vote overnight, was an illustration ("a rare event for a pro-highway committee that often votes unanimously"). The success of the amendment on the Senate floor illustrated the changing picture. Even in the House, where the highway lobby was "most potent," pro-transit interests thought they might have won a vote on the merits instead of on the procedural issue of the Rules Committee resolution:

> The pro-transit forces think the highway lobbyists would be wise to compromise ("They just can't seem to see the handwriting on the wall," an administration official says). One possible compromise would be to fatten the trust fund with new taxes, then use the fund to aid both roadbuilding and transit. But compromise didn't enter into the lobby's plans this year, even though the lobby's united front has broken down a bit of late.

Still, the House Committee on Public Works was seen as "a bastion of pro-highway support," Karr explained at the end of the article:

> In fact, the rural-dominated panel is philosophically so attuned to the highway lobby that it may almost be regarded as an extension of the lobby. For, as a committee staff man

> remarks: "We hear from the highway lobby, but we don't need to." And as Chairman Kluczynski explains: "We are all cousins." [Karr, Albert R., "The Highway Boys Win Another One," *The Wall Street Journal*, October 10, 1972]

Passing the House Bill

With the House Rules Committee resolution adopted, the House turned to the Public Works Committee's bill. Representative Kluczynski, the floor manager, began on a defensive note:

> [The] Federal Aid Highway Act of 1972, H.R. 16656, is now before this body and I believe it one of the best highway bills ever to come out of the Committee on Public Works. We have produced a highway bill this year which will give direction to the highway program for many years into the future.
>
> I would like to make it clear to you Members at the outset that this is not just another highway bill to add more miles of big monstrous freeways or to pave over the country and the cities with concrete and asphalt as many of our critics would have you believe. This is a highway system designed to meet the needs of America.

After summarizing the growth in vehicles, miles traveled, and deteriorating road and bridge conditions, he continued:

> So you see ladies and gentlemen, the problem we face in our highway program. With practically the same number of miles of road we must provide for almost a doubling of vehicles and vehicle miles of travel in only a 15-year period. Our program is not basically adding more miles of road, it is one of improving the safety and capacity of the ones we have. And believe me this is a costly proposition.

He went through some of the elements of the bill. He said the bill reduced authorizations for the Interstate System (from $4 billion to $3.5 billion a year) for two reasons. First, with 80 percent of the Interstate mileage open, the remaining mileage was taking "a little longer to build" so less funding would be needed each year. Second, additional funding was needed for the Federal-aid systems as they transitioned from the 50-50 matching ratio to 70-30. He stressed the policy statement in the bill that as the Interstate System nears completion, the national emphasis should be on accelerated construction of the other Federal-aid systems. "This policy is absolutely necessary if we are ever going to come close to meeting the needs I outlined earlier . . . ."

He said, "let me assure you that the Interstate System is coming to a close." Three States will have received all their Interstate authorizations in FY 1975 (Delaware, Nebraska, and North Dakota). To ensure rapid completion, the bill required the States to submit all remaining PS&Es to the Secretary by July 1, 1977 (except in the District of Columbia). [*Congressional Record-House*, October 5, 1972, p. 34078-34079]

Representative Kluczynski yielded time to other supporters of the bill. One of them was Representative Schwengel, who began by noting "with great pride" that he had voted for the

Federal-Aid Highway Act of 1956, which had resulted in "one of the finest investments in America that we have ever made in the form of a public works project." The cost-benefit ratio "has exceeded anything we have ever attempted in the form of a public works project."

He had listened to mass transit advocates, but concluded that the bill took the wise step of turning down their appeals for funding. Now, he said, "we can give more thought to this problem and evolve a plan which will come to grips with it and bring it to a successful consummation." After all, one of the "tragedies" of mass transit was that "we do not know how much it will cost." Officials from New York City had said they needed $9 billion. "That is just for New York City," and 67 other communities could support some form of urban transit. The bill provided funds to study the problem and help Congress identify solutions. [*Congressional Record-House*, October 5, 1972, p. 34083]

Representative Clausen of the Public Works Committee explained that he did not favor diversion of Highway Trust Fund revenues to non-highway related transit. He said that "if this occurred—and I am sure that the battle is far from over—it would have the net effect of literally drying up the very fund upon which those who look to the fund for help in financing non-highway related transportation." He favored creation of an urban area transportation system trust fund. The study called for in the bill would lead to hearings where Congress could "determine not only what the actual facts of transit life are as far as the needs and the estimates of costs of proposed programs are, but how to finance them through the creation of a third trust fund." [*Congressional Record-House*, October 5, 1972, p. 34087]

Representative Abzug quoted her testimony before the Subcommittee on Roads in support of mass transit. She added that, "It is extremely urgent that we provide Federal funds for the construction, maintenance, and operation of mass transit facilities." Further, "We must stop looking upon the highway trust fund as a sacred cow and start being realistic as to our transportation needs."

She also expressed her concerns about the precedent set by the provision related to the U.S. 281 North Expressway in San Antonio:

> I do not believe that Congress should become involved in trying to unravel specific highway disputes or disputes on any similar projects. I do not believe we should review each case in which a court grants an injunction under these statutes [NEPA and Section 4(f)] . . . . While section 113 is by its terms limited to San Antonio, many people throughout the country see the far ranging implications of this section and the threat it poses to existing environmental legislation. [*Congressional Record-House*, October 5, 1972, p. 34087-34088]

Representative Stanton said he appreciated the fact that the Federal-Aid Highway Act of 1970 had opened the Highway Trust Fund to highway-oriented public transportation. Now, however, "those critical transportation needs are not only still with us, but have intensified and we must go farther and reach more deeply into the heart of the urban transportation crisis." Support for urban roads and highway-oriented transit must be followed by a new opportunity, namely giving local officials the option of creating mass transit facilities as well as highways.

The first step in fulfilling this opportunity was giving State and local officials the option of deleting nonessential segments of the Interstate System:

> The funds released by any such deletions should be made available for all forms of transportation, not just highways. Sometimes other roads would be constructed with the funds, at other times, bus or railway transit systems. But essentially interstate sections which would cause unnecessary environmental, social, and economic damage—unnecessary because the section itself is deemed unnecessary—would now be deleted as would sections that simply were planned to suit the needs of another era.

He then discussed the amendment to allow Federal-aid urban system funds to be used for any form of mass transit, including rail facilities. The urban Interstates, he said, "have been reduced, for hours each day, to long, involuntary parking lots." Every time a new highway opened to cope with the problem, "we simply draw more cars onto the road." More highways may be the answer in some cities, but others needed public transportation. [*Congressional Record-House*, October 5, 1972, p. 34092]

Representative Anderson reiterated the importance of broadening funds for mass transit. Regarding the Rules Committee's resolution, he asked, "First of all, is it germane?" He answered, "I feel it is" because it was simply an extension of the bill's efforts to expand options other than the automobile for relieving urban congestion. What, he asked, could help solve the problem more than allowing a small amount of funding ($700 million in Federal-aid urban system funds) for mass transportation as well as highways?

This amendment, which had been ruled non-germane, was not a raid on the Highway Trust Fund. Under the amendment, the funding that could be used for highway-oriented public transportation also could be used for rail facilities. As for breaking faith with the highway user, he pointed out that, "during the rush hours our highways are clogged; no one can get anywhere with any degree of speed or efficiency." Does it not make sense, he asked, to give those motorists another option rather than simply building more freeways? [*Congressional Record-House*, October 5, 1972, p. 34092-34093]

The Reverend Drinan contrasted his efforts to improve State Route 52 in central Massachusetts with efforts in Boston to block construction of the Inner Belt/I-695. Unlike the "fierce local opposition" to the Inner Belt, the proposal to upgrade Route 52 "is both vitally needed and has received virtually unanimous support." He supported the provision authorizing funds for priority primary routes that could be used to upgrade Route 52. However, he was deeply concerned that the bill did not provide an adequate solution for urbanized areas:

> It seems to me, and to many of us, that the answer to the urban transportation crisis does not lie in more roads alone. The urban transportation crisis demands greater flexibility on the part of the Federal Government than is contained within this bill.

For that reason, he supported the Cooper-Muskie amendment on the use of Federal-aid urban systems funds. He pointed out that on October 2, Jack Beidler of the United Auto Workers had written to every Member of Congress:

> The over-use of automobiles in urban areas threatens the health of city-dwellers and the vitality of our cities. Indeed, continued reliance on the automobile for intra-urban travel will inevitably invite controls on the use of automobiles with consequent injury to the industry.

The proposed amendment would provide the relief from such restrictions by offering an alternative that local officials could use to address congestion and related environmental problems.

He also supported the amendment suggested by Representative Stanton that would allow Interstate funds to be used for non-Interstate purposes at the option of State and local officials. [*Congressional Record-House*, October 5, 1972, p. 34199-34100]

Representative Frank Annunzio (D-Il.), a lifelong Chicago resident, urged his colleagues to oppose the rule they had already voted on. The Senate, he said, had broken 15 years of precedent by approving the Cooper-Muskie amendment by a wide margin. They put aside partisanship to address "our present crisis in urban transportation." He said he had been the author of the measure in the Housing and Urban Development Act of 1972 that would have allowed Federal funds for operating subsidies:

> With the failure of passage of the 1972 Housing Act, the inequities in Federal financing remain unchanged, while the Federal dollars remain easily available for highway construction. This failure has been a critical blow to our cities, including Chicago . . . . And unless we make full provisions for a program to meet and solve the urban transportation snarl, it will grow progressively worse, and I fear that the only alternative being offered to us is bigger, better, longer, and wider concrete highways. There is still time to act—but it must be now. [*Congressional Record-House*, October 5, 1972, p. 34100-34101]

Representative Koch also spoke in support of mass transit funding:

> Do more highways necessarily benefit highway users? Or at this point in time can mass transit perhaps better serve highway users, as well as their own users, in many urban areas? History has shown that new highways simply attract more cars that slow the pace of traffic and ensnarl the streets of our central cities . . . . There comes a point of no return in highway building. No matter how many freeways we build, central cities can cope with only so many cars.

Even the auto company executives, he said, whose livelihood depends on the sale of motor vehicles had supported the Michigan legislation to allocate some State highway user revenue to mass transit.

Since coming to Congress in 1969, he had tried to create a Mass Transportation Trust Fund, but in this Congress he also had introduced a bill to create a single Transportation Trust Fund spanning all modes:

> It is in my judgment the most efficient and desirable approach to the entire subject. Only when localities have one source of transportation funding; [sic] namely, a single trust fund, will they be given a real choice in determining what form of transportation to construct. It is time that the Congress act to provide some of this needed flexibility in the Federal aid highway bill. [*Congressional Record-House*, October 5, 1972, p. 34106-34107]

In the final stage of introductory comments, Chairman Blatnik urged the House to approve the bill. Over the next 30 years, population would double and 80 percent of the growth would take place in urban areas that occupy only 3 percent of the land area:

> No prophetic vision is required to foresee the chaos that will then exist if we allow ourselves now to be divided by needless conflict instead of uniting on a prudent course of action.
>
> There is no cause for conflict. The question before the House today is not whether one form of transportation shall be chosen instrument of the future, but how best to meet the very different—and equally pressing—transportation needs of rural and urban America.

He agreed with those members pressing for mass transit facilities and those who favored improving primary and secondary roads outside urban areas. Highways and mass transit are needed:

> And if we are ever going to have them, if we are ever going to resolve our transportation crises, we must face up to the fact that there is not enough money in the highway trust fund, or in any other existing fund, to pay for them.
>
> Trying to do both jobs out of the same limited pool of Federal money makes about as much sense as trying to stretch a baby's clothes to fit a giant. And we are playing a cruel hoax on the people of this country if we tell them it can be done . . . .
>
> I am confident that the citizens of this country will respond to the crisis of our transportation system, once they have been fully informed as to what must be done, and how much it will cost them.
>
> But let us not delude them and ourselves with the notion that the job can be done on the cheap by grabbing a fistful of mass transit money out of the highway trust fund this year and another fistful next year.

The bill before them recognized "the dual nature of our transportation problem" by clearing the way "for genuine rather than token action on mass transit for the cities" while making a start on "closing the gap that has existed for too long in the rural and semirural sectors of our highway system."

The importance of rural road development was shown by the fact that it could reverse the migration toward the cities, helping to correct a problem that was usually defined as "overpopulation" but should be called "maldistribution of population." He said that, "America has room for all our people and can support the growth we expect; but not by compressing all of them into a few large, unmanageable urban sprawls."

As for mass transit, Chairman Blatnik cited the bill's provision calling on the Secretary of Transportation to study the problem and report his findings to Congress. "This evaluation is not just another wheelspinning study; it is an action plan to be presented to the Congress . . . little more than 15 months from now." It will examine each urban area to identify their different needs. With this information in just 15 months ("not an interminable delay"), "we will be in a solid position to determine what funds may be needed from the highway trust fund and other sources for mass transit."

He concluded:

> We are going to need enormous sums of money in the years ahead to provide the mass transit facilities that our urban centers must have. And snatching $800 million, or even $2 billion, out of the highway trust fund would not even make a dent in the total need . . . . We are not going to solve our problems by pitting rails against roads in competition for the highway trust fund. This legislation recognizes that new sources of funds must be found and brought to bear on the totality of our Nation's transportation problem. [*Congressional Record-House*, October 5, 1972, p. 34107-34108]

Following introduction of the bill, Representative Anderson introduced his amendment. Representative Robert E. Jones (D-Al.), a member of the Public Works Committee, raised a point of order based on the Rules Committee resolution that found such amendments non-germane. Moreover, the Committee on Ways and Means had jurisdiction over changes in how the Highway Trust Fund revenue could be used.

Representative Anderson argued that "the public transportation amendment which expands the use of highway trust fund moneys—is not a tax matter—but rather is a disposition of those taxes, a public works matter." As for whether the amendment was germane, he said that it "is directly related to the avowed purpose of both the law, and section 122 of the bill."

After listening to further debate, Representative Morris K. Udall (D-Az.), serving as Chairman of the Committee of the Whole, ruled that the amendment was not germane.

Representative Anderson immediately introduced a second amendment that was identical to the first except that it deleted each reference to rails, so it applied only to buses. Representative Jones said that the amendment basically now allowed Federal-aid highway funds to purchase buses. As Jones put it, "the amendment just puts us into the business of buying buses." He said, "I cannot understand why the point of order, if it could be sustained as against the first amendment, would not be sustained on this amendment.

The Chairman, Representative Udall, again ruled that the provision was not germane. The House would not vote on either amendment. [*Congressional Record-House*, October 5, 1972, p. 34115-34117]

After discussing highway-related provisions, Representative Abzug introduced an amendment the modified metropolitan planning. It would allocate Federal-aid urban funds based on population and provide the funds directly to duly constituted metropolitan transportation agencies formed by general purpose local governments that would have the authority to carry out Federal-aid urban system projects. She said that "this provision would reduce the power of State highway officials to deny funding to a local area whose officials refuse to accept the State officials' dictates as to where a project should be built." She also pointed out that the amendment had the support of the Secretary of Transportation, the Conference of Mayors and the National League of Cities.

Representative Harold T. "Bizz" Johnson (D-Ca.), who had been Mayor of Roseville (1941-1949) and a State legislator before winning election to the House in 1958, was a membter of the Public Works Committee. He objected:

> Over the years this highway program has been run on the most basic principle of government—the Federal-State relationship. There is no reason in the world why that should be changed.

The States were better equipped to set priorities across the State and among the cities. "If we do not continue this State relationship it means chaos in the administration of the program."

Representative Harsha agreed with Representative Johnson:

> In addition, it would encourage the creation of new bureaucracies, as the number of mini highway departments in all of the urbanized areas within which this money would be distributed are established. The effect of their creation would be to further compound the problems that already exist in getting highways built as quickly as possible.

He added that the amendment was "nothing more than an indirect form of special revenue sharing which the proponents of special revenue sharing were not able to secure approval of in the normal fashion." This amendment was a way of circumventing the jurisdiction of the Ways and Means Committee, which had jurisdiction over revenue sharing. "That is all this amendment is. It is an attempt to get, indirectly, what they could not get directly."

The amendment was rejected, 9 to 49. [*Congressional Record-House*, October 5, 1972, p. 34124-34126]

Representative Abzug introduced an amendment striking the provision prohibiting any court from issuing an order or taking any action to impede, delay, or halt construction of the Three Sisters Bridge linking Virginia and the District of Columbia. It also prohibited any such action by the Secretary of Transportation, the head of any other Federal Agency, the government of the District of Columbia, or any other body. She said that "even if the bridge is the greatest thing that could happen for transportation in this area," she opposed the provision because it created an exception to NEPA and deprived citizens of the United States "of their right to have access to the courts for redress of their legal grievances."

Minority Leader Ford agreed that the language in the bill was strong, but pointed out that "the language has come at the suggestion of a per curiam decision or memorandum from the Chief

Justice of the Supreme Court of the United States. On March 27, 1972, the Supreme Court had rejected the Nixon Administration's appeal of the U.S. Court of Appeals ruling issued October 12, 1971, requiring additional studies. As is typical when the Supreme Court rejects an appeal, it did so in a one-sentence statement without explanation. However, Chief Justice Burger had issued an unusual opinion explaining that he concurred in the decision to reject the appeal "but solely out of considerations of timing." The appeal, he said, contained questions of great importance to the Washington area, "not the least of which is whether the Court of Appeals has, for a second time, unjustifiably frustrated the efforts of the Executive Branch to comply with the will of Congress as rather clearly expressed in Section 23 of the Federal-Aid Highway Act of 1968." He did not want to delay work on the bridge for the year it would take before the Supreme Court could render a decision on the appeal. Representative Ford read the statement into the record, including its conclusion:

> In these circumstances Congress may, of course, take any further legislative action it deems necessary to make unmistakably clear its intentions with respect to the Three Sisters Bridge project, even to the point of limiting or prohibiting judicial review of its directives.

The Minority Leader said the provision in the 1972 Act was a direct result of the Chief Justice's suggestion and that the Chief Justice "fully concurs in the proposal by inference, if not directly, in this bill." Later in the debate, he added, "The Court is telling us we should do something of this kind, as reflected in this section, in order to stop the kind of litigation which has frustrated the Congress and the people of this area for better than 6 years."

Representative Abzug responded to Representative Ford by saying that after listening to the views of her colleagues, "I am more convinced than ever that this is one of the most scandalous provisions I have ever seen in a piece of legislation." The principle that citizens could be stripped of their right to petition the courts "does not affect only the Three Sisters Bridge area; the principle affects every single place in the country."

She also responded directly to Representative Ford:

> So far as the comments of Chief Justice Burger are concerned—by the way, they were purely an aside and certainly do not have the force of law—this provision goes way beyond even what he said. Even though he is a judge, his comments may have been injudicious. He did not suggest that we should restrain or should prevent any citizen from doing anything at all as to the enforcement of any provision of law relating to the Three Sisters Bridge. He did not say we should make it unreviewable by any court. Members are distorting it by constantly saying that is what the Chief Justice said.
>
> In any case, his statement is not a part of the law, and it was not a part of the decision. In fact, the decision sustained the lower [court], which had ruled that the bridge could not be built unless certain conditions were remedied. We must recognize that what is involved here is a complete denial of due process to any citizen who pays taxes in this area or in every other area of this country, and no responsible body, no legislature, could possibly agree to that and believe any words in the Constitution.

After a lengthy discussion, the House rejected the amendment, 125 to 173. [*Congressional Record-House*, October 5, 1972, p. 34130-34141]

Representative Stanton introduced an amendment on transfer of Interstate System mileage within a State. He said that "one of the biggest transportation headaches" facing State and municipal officials was unwanted urban Interstates "by reason of environmental and social disruption." He explained:

> With a situation of this nature, State and local officials often would prefer to abandon projects representing such segments, but they are naturally loathe to forego this type of transportation improvement if project abandonment means giving up altogether the Federal funds involved.

Current law allowed officials to transfer the funds from one Interstate to another, and even provided 200 additional miles to facilitate such transfers where the new route was longer than the old. The bill before the House removed the mileage limit for Interstate substitutions, but in Representative Stanton's view that change did not go far enough:

> My amendment would permit State and local officials to ask the approval of the Secretary of Transportation for transfer of funds representing the estimated cost of an unwanted interstate segment to the Federal-aid urban system for use on that system in the urban area affected.

The Secretary could approve the transfer of Interstate funds if he concluded that the segment was not essential for Interstate continuity:

> In these times when there are so many pressing demands on public funds at all levels of government, and when urban transportation problems are so severe, it verges on the criminal to let Federal funds be used for unwanted projects when State and local officials can find more desirable alternatives that better serve local, State, and Federal interests.

Representative Howard of the Public Works Committee objected because "the Interstate System is set up so all the interstate money will be used only for interstate roads." The bill already provided funds for roads off the Interstate System. He said the "one great mistake" in the amendment was its unfairness to nonurban areas. If an Interstate segment were not built in a rural area, the area would not get money for any kind of road. The amendment "would leave gaps and holes in the interstate system and would not do anything for any lasting good for urban areas and would prevent even 1 foot of a trail road being built outside of an urban area."

The amendment was rejected. [*Congressional Record-House*, October 5, 1972, p. 34141-34142]

Representative John E Moss (D-Ca.) introduced an amendment to delete Section 109 on minimizing red tape. Section 109 added a subsection to 23 U.S.C. 101 ("Definitions and Declaration of Policy"):

> (e) It is the national policy that to the maximum extent possible the procedures to be utilized by the Secretary and all other affected heads of Federal departments, agencies, and instrumentalities for carrying out this title and any other provision of law relating to the Federal highway program shall encourage the drastic minimization of paperwork and interagency decision procedures and the best use of available manpower and funds so as to prevent needless duplication and unnecessary delays at all levels of government.

He stressed that he was as opposed to red tape as any Member of Congress, but "I do not know what redtape [sic] means—and I do not know what 'reduce to a minimum' means." He pointed out that "this broad brush language encompasses many statutes that have a direct effect on the highway program." He cited Fair Labor Standards laws, minimum wage, the Davis-Bacon Act, environmental laws, and others that apply to all Federal agencies, not just FHWA. He continued:

> I submit there is far too much redtape in all our Government and that we, in the Congress, ought to act affirmatively to clear it up. But I think much of it must be recognized as being there because the Congress has mandated procedural requirements that make it impossible to operate without that redtape. If we want to objectively look at our laws and the policies imposed upon departments and agencies and eliminate them specifically, I will give my wholehearted support, but this is not the way to do it.

Representative Wright, who had proposed Section 109, said "I honestly hope this section does some good." He did not think it would do any harm, but "if there is any one thing we do need, it is something to stop the proliferation of paperwork and redtape which seems inexorably to attach itself to every program as it matures." To illustrate the proliferation of red tape, he said that in 1950 or thereabouts, President Harry S. Truman had asked Alf Johnson of the Arkansas State highway agency to work with other State highway officials who opposed Federal-aid to convince them to support it:

> Alf Johnson reported that the reason they had heretofore opposed Federal aid was that without Federal aid they could build a highway and get started on it at least 6 months after they decided they needed to go ahead, but with federal aid it took a year and a half.

Now, Wright said, project development took 7 years. "Seven years from the time they decide they need the highway until they have fulfilled all of the proliferating requirements and may commence." He added that former Administrator Turner had testified "that new requirements imposed by laws and guidelines executively written were going to require—get this—18 million additional pages of paperwork a year by his department alone." To illustrate, he held up a photograph sent to him by the Illinois State Highway Department:

> The picture depicts all the paperwork related to just one highway project in their State. It is stacked between two chairs and two miniskirted girls are standing tiptoes on the chair trying vainly to reach the top of the stack.

Representative Dingell (D-Mi.) asked if the provision repealed NEPA. Wright replied that it did not repeal NEPA or any other law. What Section 109 did was simply direct the bureaucrats "to the maximum extent that they can to reduce excessive paperwork and to use minimum guidelines when they are necessary." He added that, "We passed one law with 45 words and by the time they wrote guidelines it had 7,500 words . . . and it literally required books for those trying to work under the guidelines."

The amendment to remove section 109 was defeated without a recorded vote. [*Congressional Record-House*, October 5, 1972, p. 34145-34146]

Representative Koch introduced an amendment on "Bicycle Transportation" that would allow FHWA to help States and localities build bicycle and pedestrian paths in conjunction with highway rights-of-way. His amendment was identical to a provision in the bill approved by the Senate with Administration support. In view of the growth of bicycling in recent years, "It is important that bicycles be recognized as a component of our transportation system." The purpose of the amendment was to "encourage the development and use of bicycle transportation so as to increase the traffic capacity of the Federal aid systems and to permit the development of pedestrian walkways in conjunction with highway rights-of-way." The amendment authorized $10 million a year (FYs 1974 and 1975) out of the Highway Trust Fund for the Federal share of the cost of separate or preferential bicycle lanes or paths, bicycle traffic control devices, bicycle shelters and parking facilities, and pedestrian walkways.

Representative George W. Collins (D-Il.) introduced a substitute that limited the funding for bicycle paths to forest development roads and trails, park roads and trails, parkways, Indian reservation roads, and Federal, State, and local parks. Representative Harsha said that the substitute amendment "cleans up the problems we [the Public Works Committee] had with the original amendment, and we are willing to accept it."

Representative Wright explained why he supported the Koch amendment. He said that "bicycling is an American tradition" that had emerged "as one of the most remarkable social phenomena of our times." It was no longer "a shiny toy more at home with children on the sidewalks than with the busy commuters on the streets of our cities and towns." The question was where the estimated 80 million Americans would ride their bicycles:

> Naturally, bicycles are banned from high-speed roads. They are not permitted on many sidewalks. They are extremely dangerous on crowded city streets, and are generally confined to the right lane in order not to obstruct traffic . . . . So most cyclists must share the city streets with cars and buses . . . .
>
> Americans are used to a mobile society and we have reached the point where we are going to have to find unique solutions to some of the problems brought about by this way of life. I believe a system of bicycle ways and pedestrian paths in conjunction with highway projects would provide such a solution.

In opposition to the substitute amendment, Representative Marvin L. Esch (R-Il.) pointed out its limitation to park lands and similar places:

> The intent of the main amendment is to provide for bicycle paths where they are needed the most; that is, within the cities in relationship to our highways.

He urged the Members to reject the substitute and support the Koch amendment.

The House agreed to the Collins substitute amendment and rejected the Koch amendment, again without a recorded vote. [*Congressional Record-House*, October 5, 1972, p. 34147-34148]

Representative Bingham introduced an amendment to delete Section 126, which called for designation of a 10,000-mile network of priority primary routes. "Frankly, you can call it what you want but what this system really is is a 10,000-mile extension to the Interstate System." The only difference was that the Federal share would be 70 percent, not 90 percent. It was funded at $600 million a year initially but he estimated it would end up costing $19 billion. Secretary Volpe, Representative Bingham said, had strongly objected to the new program. Voting for his amendment would be an economy vote and an ecology vote. "To now sit down at the map and draw up a 10,000-mile highway network that we are going to be building for the next two decades, makes absolutely no sense at all." He would prefer to give the funds to the States "with the fewest possible strings attached."

Rising in support of Section 126, Representative Cleveland said that the priority primary provision "is a most important part of this year's Federal-Aid Highway Act." In view of requests from around the country to expand the Interstate System, the Public Works Committee "believes it desirable to encourage and assist the States in building a new intermediate system of highways." He explained:

> The aim would be to improve a limited, integrated system of supplementary routes to be especially financed out of revenues from the Highway Trust Fund. In conjunction with the Interstate System, the new routes will provide accessibility to over 90 percent of all urban population and nearly all urban places of over 55,000 in size. In addition, such routes would provide much needed service to those rural regions through which they would pass.

The amendment was rejected (the recorded vote was 9 to 68), leaving priority primary routes a part of the bill. [*Congressional Record-House*, October 5, 1972, p. 34148-34150]

An amendment by Representative James J. Pickle (D-Tx) proposed to add a Title IV ("Transportation Development") to the bill. It would create a Transportation Development Administration in the Department of Transportation "to provide for the better coordination of research and development, planning, and demonstration projects," as Pickle described it. "The goal of this amendment is to help this Nation design and institute a meaningful national transportation policy." The Chairman, Representative Udall, ruled the amendment not germane and it was not subject to a vote. [*Congressional Record-House*, October 5, 1972, p. 34153-34156]

Finally, the House approved the bill, as amended, by a vote of 264 to 30.

The House and Senate would now establish a Conference Committee to reconcile to their two versions of the Federal-Aid Highway Act of 1972.

The Conferees Reach Agreement

With Congress nearing adjournment, and all Representatives and one-third of Senators eager to return home to their reelection bids, the conferees were under a strict deadline to resolve differences. In some respects, the task was simple. The House and Senate Committees on Public Works dominated the conference and their members could relatively easily compromise on the highway provisions. However, the conference included Senators Cooper and Williams, both determined to preserve as much transit spending in the final bill as possible.

On October 11, the *Times*' Rosenbaum reported that the conferees were deadlocked. "The principal issue is whether any of the highway money will be made available for mass transportation." He summarized the deadlock:

> According to reports from the conference room, Senate negotiators refused to accept any long-range highway legislation unless it allowed urban areas to use their share of the trust fund to buy buses and build rapid rail systems.
>
> House conferees reportedly objected to any legislation that would permit the trust fund to be tapped for mass transit.

The deadlock, he reported, "appeared likely to kill any major highway bill for the year." [Rosenbaum, David E., "Deadlock by Conferees Blocks Road Fund Aid to Mass Transit," *The New York Times*, October 12, 1972]

The following day, Friday, October 13, Peter Braestrup of *The Washington Post* reported that conferees were close to a compromise:

> The pro-highway House conferees, led by John Kluczynski (D-Ill.) of Chicago, were said to have offered a swap to the Senate pro-transit faction, led by John Sherman Cooper (R-Ky.). The offer was attractive to lobbyists for highway interests and the mayors, but not the administration or environmental groups.

The key was that the Senate bill included the controversial Cooper-Muskie amendment involving Federal-aid urban system funding, but also Senator Williams' provision for $3 billion out of the general Treasury for mass transit over 3 years plus $800 million over 2 years for operating subsidies:

> In effect, the House conferees last night said they would accept the Williams program—and even sweeten its provisions with more money [to $4.4 billion]—as long as the pro-transit senators agreed to drop the Cooper provision and leave the highway trust fund untapped for two more years.
>
> Cooper, who held proxies from six of the 12 senators in the conference committee [who were not present], was reported to be under heavy pressure last night from Williams to accept the House deal.

> Department of Transportation lobbyists and John Kramer, head of the environmentalist Highway Action Coalition, were urging Cooper to stand firm. [Braestrup, Peter, "Hill Nears Agreement on Road Act," *The Washington Post*, October 13, 1972]

An account in Washington's *Star-News* reported that Senate conferees said they would rather "see the entire highway bill go down the drain" than agree to some of the House provisions, including the one on the Three Sisters Bridge:

> The House, irked by years of litigation which has blocked construction of the span across the Potomac River, earlier voted to prohibit the courts from halting or further delaying construction of the bridge project. In so doing, the House was acting upon a suggestion by Chief Justice Warren Burger that Congress might wish to remove the bridge from any possible review from the courts.

Illustrating the difficulty of resolving issues such as this, the article quoted Senator Muskie as saying the entire House bill was "an indigestible morsel." [Angle, Martha, "3 Sisters Bridge Issue Stalls Highway Bill," *Star-News*, October 13, 1972]

On October 15, 1972, *The New York Times Magazine* carried a lengthy article by William V. Shannon called "The Untrustworthy Highway Fund." It began:

> After years of skirmishing, border raids and local guerrilla actions, the great highway struggle has broken out in open warfare. At issue is the fate of the Highway Trust Fund, which grows by more than $5-billion a year, pumps money into the states to build more roads for more automobiles and has had more to do with determining the physical character and social style of America's cities and suburbs than any other Government program.

Senate adoption of the Cooper-Muskie amendment, Shannon said, "was the first time either house of Congress had ever voted to divert any part of the Trust Fund revenues for anything except highway construction." Although the more expansive Kennedy-Weicker amendment was defeated, "it laid down the lines along which the coming struggle over national transportation policy will be waged." The goal was to convert the Highway Trust Fund into a general transportation fund.

Shannon pointed out that, "Highway interests have naturally made skillful propaganda use of the phrase 'trust fund.'" He quoted Senator Gaylord Nelson as asking, "If annual appropriations from the general fund and full, flexible control by the Congress are good enough for national defense, for housing, for education, why are they not good enough for highways?"

In the early days of the Interstate System, it was "greeted with fairly widespread approval." Shannon continued:

> But by the nineteen-sixties, Americans were becoming increasingly aware of the defects of life in the automobile age . . . . The automobile explosion has begun to arouse the alarm already evoked by the explosion in human population. Every time a baby is born in this

> country, two automotive vehicles are also born . . . . The appalling cost of a transportation system based upon tens of millions of private automobiles is gradually becoming apparent.

He quoted BPR's brochure *America's Lifelines* "boasting" that total excavations for the Interstate System "will move enough materials to bury Connecticut knee-deep in dirt" and that sand, gravel, and crushed stone could be used to "build a wall 50 feet wide and nine feet high around the world." Shannon said that, "Facts like these, which once would have been innocently impressive, are seen as alarming in a time of new concern over the dwindling supply of natural resources and the mutilated landscape."

The need for alternatives such as subways in big population centers "is obvious." Mass-transit facilities are admittedly expensive to build, renovate, and operate:

> But the financing ought not to be a problem: If Congress in 1956 had decided to allocate half the money in the Highway Trust Fund to highways and the other half to mass transit, scores of bus companies would not have gone into bankruptcy and commuter railroads would not have sunk into weedy disrepair.

He summarized highway controversies in Boston, Memphis, New Orleans, and Washington, D.C.:

> The antihighway forces have triumphed often enough to turn a once lightly contested issue into a closely matched struggle . . . . The Interstate system, the proud blue ribbon of the highway profession, has had the unintended effect of catalyzing diffuse antihighway sentiment and bringing into existence for the first time an effective national lobby against unlimited road building.

The Highway Action Coalition "is still far smaller in staff, financial resources, and political clout than its opposition spearheaded by the Highway Users Federation for Safety and Mobility." He discussed HUFSAM and AASHO, the latter with its "close links with Federal highway officials":

> These [Federal] engineers are also construction-and-maintenance oriented. Their narrow focus accounts for the highway lobby's intransigent resistance to the use of Trust Fund money for any other purposes, even highway-related ones such as safety or beautification.

They had "an ingrained hostility" to the "esthetic concerns of the landscape designers and the social concerns of the land-use planners." Shannon said that, "In their view, all that fussing about abstractions merely gets in the way of laying the concrete and moving the traffic."

HUFSAM, Shannon reported, had been "embarrassed" when a poll it commissioned was leaked to antihighway forces. The poll found that 57 percent of rural and urban people thought that limited automobile use in downtowns was a good idea. In cities, 66 percent favored this proposal.

As for former Administrator Turner:

> The hero of the career highway men has been Francis C. Turner, director of the Bureau of Public Roads under the Johnson Administration and promoted by Mr. Nixon to Federal Highway Administrator. Until his resignation in August [sic], Turner was a close rival to the late J. Edgar Hoover when it came to blunt talk and pushing for his programs, regardless of what his political superiors thought. Turner regularly denounced advocates of rail transit and critics of urban freeways.

Shannon described the *Resource Book on the Federal-Aid Highway Program* as "a manual of quick rebuttals to every criticism made of highways" and the role of TRIP:

> Everyone has heard of the "military-industrial complex" against which President Eisenhower warned in his farewell address, but at least equally powerful is what The Wall Street Journal has termed "the highway-auto-petroleum complex."

This complex remained unbroken, "but for tactical and public-relations purposes, some of its members have begun to back away from the lobby's hard-line, highways-or-nothing approach." Examples included Henry Ford II, Mobil Oil, and the National Automobile Dealers Association. "These shifts in position are significant if only as evidence that important interests are responding to a changed climate of opinion."

Unfortunately, "news of peace and reconciliation between automobiles and mass transit seems not to have reached Capitol Hill." Section 4(f) of the Department of Transportation Act of 1966, the first legislative victory of the anti-highway forces, and NEPA had been "under continuous counterattack by pro-highway forces in Congress." The proposed Federal-Aid Highway Act of 1972, Shannon said, undermined both. One provision "flagrantly" authorized the U.S. 281 North Freeway in San Antonio while another restricts the scope of citizen suits. "Since citizen organizations have won so many highway battles only in their last line of defense, the courts, these seemingly obscure provisions may be as significant as the better-publicized struggle to open the Highway Trust Fund for mass transit use."

The struggle to enact the Cooper-Muskie amendment gave anti-highway forces hope that someday, the Kennedy-Weicker amendment might be enacted. Unfortunately, adoption of the Cooper-Muskie amendment "is no guarantee that more progress in this direction is sure in the future." As reflected in the House version of the Federal-Aid Highway Act of 1972, "defenders of the Highway Fund are dug in to defend their special access to the U.S. Treasury." What made the sides in this fight so entrenched was that neither can "understand why their opponents think the way they do":

> One side sees the automobile as the basis of the contemporary American Way of Life, a marvelous vehicle which provides mobility, privacy, and the exciting lure of the open road. The other side sees the average American in need of emancipation from the tyranny of the automobile, which kills tens of thousands every year, poisons the air, paves over the landscape with endless ribbons of concrete and ugly gas stations and used-car lots, and provides only a noisy, slow, psychologically irksome and increasingly expensive and inconvenient form of transportation.

The outcome of the battle between the pro- and anti-highway forces "is now very much in doubt." Perhaps, Shannon concluded, "this is because in the end the battle is not for money and concrete, but for the mind of the ordinary American." [Shannon, William V., "The Untrustworthy Highway Fund," *The New York Times Magazine*, October 15, 1972, p. 31, 120-128, 128, 132]

The *Times* published a response from HUFSAM's Jack C. Martin in the letter-to-the-editor column of the magazine's November 5 issue. Martin said the amount of space devoted to the article "was most impressive," but he considered it "unfortunate" that Shannon "did not report the situation a little more realistically." He clearly had "relied on blatant antihighway propaganda and biased newspaper articles for his facts." For example, the statement that HUFSAM had been embarrassed by the opinion survey and the implication that it had withheld the results were "totally unfactual." HUFSAM had released the full results, including the support for automobile restrictions in downtowns, a few weeks after the poll was completed in July 1971.

Martin also criticized Shannon for "perpetuating the Highway Trust Fund 'surplus' myth." After explaining that the surplus consisted of money owed to ongoing projects, Martin lamented that "the hard-line antihighwayists won't listen." He concluded that, "Trying to boil a pot between highway and transit interests with distortions and clichés ('paving over America') is serving no good." What the Nation needed was an "honest and objective airing of the country's total transportation needs" so the public could make its own judgment regarding solutions. [Martin, Jack C., "Are Highways Worth It?" Letters, *The New York Times*, November 5, 1972, p. 32]

On Monday, October 16, Jack Eisen told readers of *The Washington Post* that Members of Congress had "traded angry accusations yesterday [October 15] after Senate and House negotiators failed to reach an agreement to extend the nation's highway program and expand it to include aid for urban mass transit." He said that "virtually no chance remained for a resumption of sessions" to agree on a unified bill.

The Cooper-Muskie amendment with its diversion of Highway Trust Fund revenue to transit was at the heart of the collapse. The House offer to fund transit, dollar for dollar, from the general Treasury for a total of $4.4 billion had not been enough:

> Finally, after four days of sparring in which the Cooper-led block outvoted its Senate colleagues, the sessions broke down. At 10:30 p.m. Saturday, House members stalked glumly out of the meeting room.
>
> Cooper . . . blamed the House members—for insisting on authorizing a new 10,000-mile super highway program, and for refusing to accept a compromise one-year extension of the existing highway law. He said House conferees insisted on 18 months or two years.
>
> Randolph, questioned by newsmen on a contradictory report of the proceedings, turned to Cooper and disagreed sharply. He said House members offered reasonable terms.
>
> Williams, with a side glance at Cooper, said those who refused to accept the House [compromise] transit plan were "sadly misguided."

> "I would suggest soul-searching with the question whether the effort was to aid mass transit or break up the highway trust fund," Williams said. "Sadly, it seems to me, the majority of the Senate conferees chose the latter course."

Representatives Kluczynski and Harsha issued a "bluntly worded statement" on behalf of the House conferees at 1 a.m. Eisen said the statement asserted "that four unnamed Volpe aides 'called the signals for this deplorable hatchet job, and they were followed obediently by seven Senate conferees—four of whom were not even present . . . .'" (Cooper voted their proxies.) The aim, the Representatives said, was "to bust up the highway trust fund at whatever cost."

With conferees deadlocked and Congress ready to go home, the Highway Action Coalition issued a statement accusing the House conferees of killing the bill "rather than accept the progressive Senate features." [Eisen, Jack, "Road Bill Dies Amid Anger," *The Washington Post*, October 16, 1972]

On October 18, the final day of the Congress, conferees surprised observers by breaking their deadlock to agree on a 1-year extension of the Federal-aid highway and safety program that would ensure the 93rd Congress would address the controversial issues the conferees could not resolve. To please the House conferees, the bill dropped the Senate provision allowing use of urban system funds for rail rapid transit. To please the Senators, the bill dropped the House's priority primary system funds but directed the Secretary to study the matter and report to Congress. The Interstate withdrawal and substitution provision of the Senate bill that allowed remaining funds to be transferred to the urban system did not survive the conference. However, the bill included $3 billion for the UMTA capital program, with a Federal share of 80 percent, and $100 million for operating subsidies the first year plus $300 million the following year, all out of the general Treasury. The Highway Trust Fund was not breached. [The conference report can be found at *Congressional Record-House*, October 18, 1972, p. 37115-37133]

The Senate considered the bill that evening. By unanimous consent of the Senators remaining in Washington, debate was limited to 10 minutes. When Senator Packwood suggested the absence of a quorum, Majority Leader Mike Mansfield asked unanimous consent to rescind the quorum call.

Debate proceeded with Senator Randolph explaining that conferees had worked approximately 40 hours before agreeing late that afternoon on a compromise:

> There was complete agreement of all conferees of the House. That is not to say that any conferees were satisfied 100 percent with the outcome of the conference. It is the composite thinking of men of understanding and purpose who were attempting to bring to fruition legislation that can be signed into law by the President to continue the highway program. We have also given dimension to other forms of transportation which have not only the approval of the American people but also the demand of the American people that we meet some of the unmet needs that have accumulated.

The bill would ensure the highway program continued without interruption. He explained that conferees had agreed on a 1-year bill "to assure that the Senate and House of Representatives would address themselves to the highway program early next year." They also would be able to consider several provisions "that were of great controversy in the conference."

The bill included all provisions that were identical or substantively alike in the House and Senate bills. He briefly listed the highway and safety provisions. He cited the general Treasury revenue for mass transit operating subsidies and increased funding for mass transit. These provisions "were adopted virtually as they passed the Senate."

He explained that the Cooper-Muskie amendment included in the Senate bill had been excluded from the conference report because its diversion of Highway Trust Fund revenue "was totally unacceptable to the House conferees." At the same time, Senate conferees were opposed to the 10,000-mile priority primary provision of the House bill:

> These were the major items on which the conferees could not concur, and they are sure to be among those which will receive searching inquiry during the first session of the 93d Congress.

He added:

> [This] conference was a difficult one, but it was carried out by men dedicated to the improvement of transportation of all types . . . . It appeared last Saturday that we would fail to produce a bill. But after considering the situation and recognizing that the highway program could not be allowed to come to a halt, I reconvened the conference this morning. I am glad to report that on this occasion we succeeded.

Senator Muskie asked for time to clarify two points. First, he wanted to confirm that the House had yielded to a 1-year bill, "which gives us a crack at this issue next year. Is that correct?" Senator Randolph agreed.

Second, Senator Muskie wanted to confirm that the bill did not authorize the priority primary system, that it expressed only the intent to consider the plan in 1973, "and that the system cannot be established without action by the Congress. Is that correct?" Senator Randolph confirmed this understanding.

Senator Cooper, in his last day in the Senate before retiring, agreed with Senator Randolph's comments about the priority primary system:

> The House conferees would not agree to the Cooper-Muskie provision. We fought against the establishment of a 10,000-mile "priority primary" system. No hearings were held on that in either House. The established [sic] minimum cost was $10 billion. We do not believe that should be done when the Interstate System is only 81 percent complete, and also it is not proper to add such a burden on the highway trust fund without proper consideration.

The 1-year extension would allow time for the Secretary to submit his recommendations and for the Congress to consider the concept. What was important was to keep the Federal-aid highway program active while the debate took place in 1973.

The Senate agreed to the report by voice vote. [*Congressional Record-Senate*, October 18, 1972, p. 37309-37311]

Bringing the conference report to the House floor, Representative Wright explained that, "It is not a perfect bill." The House yielded on some vital points, but so had the Senate. "We commend it to the Members as the best that could be achieved in the present climate." He described it:

> Essentially the bill we bring before the House in the conference report, Mr. Speaker, contains a 1-year extension of the authorization for the Interstate System and a 1-year extension of the authorization for the other systems, including the small urban systems.
>
> It contains $3 billion in authorization for mass transit out of the general fund, not out of the highway trust fund, and that $3 billion commits the Government to an 80-percent Federal matching share. Additionally, we would authorize a total of $400 million, $100 million for the present fiscal year and $300 million for the succeeding year, to be available for operating subsidies . . . .

Before he could continue, several Representatives requested assurances regarding this additional funding. Representative Ford wanted to know if it required action by the Committee on Appropriations. Yes, Representative Wright replied. The $3 billion "would be made available out of the general revenue through appropriations passed by the Congress of the United States." In response to a question from Ford about contract authority, Representative Wright added, "the construction grant commitments authorized in this bill would not be made before fiscal 1975, for fiscal 1976."

Representative John Anderson said "I am certainly still not clear in my own mind on the explanation that has just been offered as to this $3 billion . . . for mass transit." In view of the need for action by the Appropriations Committee, he wanted to know what assurance mass transit supporters had "that we are going to see anything near the sum of $3 billion made available in fiscal 1973, 1974 or 1975 for mass transit?"

Wright explained that this bill could only authorize the funds; it could not also appropriate them:

> In response to the gentleman's question as to what assurance he may have that those moneys will actually be appropriated, I would simply say that he might rely upon the assurance of the growing demand and clamor for something meaningful to be done for mass transit.
>
> The gentleman might wish to rely upon the good faith of the Secretary of Transportation who has repeatedly expressed his commitment to the needs of mass transit.

> The gentleman may rely upon the inclusion in the present bill of authorizations for operating subsidies for existing mass transit, for the very first time in the history of the Congress, for the existing fiscal year and the upcoming fiscal year.
>
> He might reply upon the fact that Senator Williams, who was the moving force in the Senate for something meaningful for mass transit, wanted this title included, is satisfied with what was done and believes it is the best that could be done.

If that were not enough to reassure Representative Anderson, Wright added:

> Beyond those assurances I know of none I could give to my friend except the growing need and the growing recognition of the need for something effective to be done to assist those communities afflicted with needs for mass transit.

In response to a question from Representative Jack L. Brinkley (D-Ga.), Representative Wright discussed the conference decision on priority primary routes:

> [This] bill establishes the intent of Congress to create a priority primary system of not to exceed 10,000 miles, to take up some of the glaring gaps that have developed in the past few years in our highway program. It calls upon the Secretary of Transportation to present to the Congress by not later than September 30 of next year an inclusive report advising us as to his recommendations for criteria to be employed for the designation of the routes to be included in that system.

He continued:

> Beyond that, I should like to add briefly that I believe the most significant and innovative thing contained in this bill is the inclusion of the House provisions in title II in their entirety. Those provisions will make available $1.1 billion over the next few years for measures expressly designed to make the highways safer.

Representative Barrett said he supported the conference report, which he said "goes a long way toward meeting our transportation needs not just for highways, but more importantly for urban mass transportation." He stressed that the omnibus housing bill had important mass transportation provisions, but that the House Rules Committee had refused to let it go to the floor for a vote. The Senate's Federal-Aid Highway Act had included those measures "and I am delighted that the conferees were able to agree on these urban mass transit provisions."

Representative Glenn Anderson of California expressed "a little concern" about the urban mass transportation funds from the general Treasury because they would mean additional taxes, instead of the Highway Trust Fund "where there is ample money." He said "we are introducing a wrong principle and a wrong area."

Representative Wright explained why the conferees took the funds from the general Treasury instead of the Highway Trust Fund. First, Congress has a "good faith obligation" to use highway tax revenue for highways. Second, “we need every penny in that highway trust fund if we are to keep that obligation.” Third, “we have done everything we think we can reasonably do and offered on the part of the House conferees to do even more.” He elaborated on this point:

> In the conference we offered to assist mass transit immediately. We offered to agree . . . with every basic premise of the so-called Cooper-Muskie or, we might say, Anderson amendment to permit the cities to have flexibility to make a decision, if they wanted to, within their own incorporated limits and to substitute rail for highways, and to give them that money through immediate obligational authority but take it out of general revenues instead of the trust fund. The senators are the ones who would not agree to that.
>
> We feel we have an obligation to the House to uphold its position insofar as possible. We feel we have yielded very greatly so far and have done everything we reasonably could to be conciliatory and ameliatory and get a bill. [*Congressional Record-House*, October 18, 1972, p. 37133-37135]

Representative Edward P. Boland (D-Ma.) said he regretted that the mass transit funds were not coming from the Highway Trust Fund. “But I am not going to belabor this point, because it is a dead horse . . . .” Instead, he wanted to stress that this bill was the first time the Congress had authorized operating subsidies. That, plus the additional $3 billion, “meets the problem and at least it is a step in the right direction.”

Representative Anderson of Illinois said “I must painfully conclude that I cannot agree with those who have just expressed the feeling that somehow in this conference report we have done a great thing for the cause of mass transit in this country.” After listening to the discussion, he could “only come to the conclusion that far from meeting the problem, we are putting it on the backburner.” The additional $3 billion for mass transit would not become available until FY 1975, while he and others had tried unsuccessfully to amend the bill to provide “$700 million now out of existing funds—out of money that is there in the highway trust fund.” He asked, “So how can you now try to sell us on the proposition that we are meeting the problem of mass transit by deferring this, by putting it on the backburner until the fiscal year 1975 . . . .” he said, “It simply defies my comprehension.” The present fiscal crisis meant the country must live within its means:

> Yet, when I look at this particular conference report, I come to the regrettable conclusion that if we adopt it in its present form, that once again this Congress will have been utterly derelict—utterly derelict—in its duty to try to establish some clear national priorities, and give the cities, to which urban systems highway money would go, the simple option of using that money for other modes of transportation.

Instead, the bill before the House offered “illusory promises of something down the road, when there are funds available here and now” in the Highway Trust Fund.

Representative O’Neill agreed with these comments. “We in the Massachusetts area have a terrific plight in the whole suburban area. We need mass transportation badly.” He, too, wanted the Highway Trust Fund broken. Actions of the past week had proven that the Highway Trust Fund “is not a sacred cow." However, he would support the bill because even if, as Representative Anderson feared, the money never became available, the House would "go back in here with special legislation to break that highway fund."

Representative John Paul Hammerschmidt (R-Ar.) thought the conferees could have done a better job, but at this late hour, approval of the bill was "vitally important to at least 36 States whose highway programs would be in desperate straits by early next calendar year if existing authority is not extended." His State, Arkansas, was one of those States. He recognized the importance of mass transit, but was pleased that the bill "does not open up the highway trust fund and break faith with those users who have paid and continue to pay into it for the construction and betterment of roads." He hoped the $3 billion for mass transit "will be a start to tackling the need but that in the next Congress we address ourselves to a solution that will not encroach on the highway trust funds."

His biggest disappointment with the bill was the failure to include the House provision on priority primary routes. The provision in the present bill at least acknowledged the congressional intent to establish such a system and was only calling on the Secretary to assist in developing a plan. "This is recognition that the plan is valid, the need is there and the program should move forward."

Representative Ford announced that he opposed the bill "for a variety of reasons." He would cite only two. First, he did not "like the idea of contract authority to the extent that is provided for in this conference report." Further, "I am totally, unequivocally, unreservedly opposed" to operating subsidies for mass transit. "I think it is the wrong program at the wrong time." Moreover, Title III would not have been considered germane had it been proposed separately to the House. "I do not think that is the right way to operate."

Representative Wright pointed out that Representative Anderson of Illinois, a Republican, "is opposing this conference report on the ground that it does not do enough for mass transit and he wants the money out of the trust fund, while the distinguished minority leader is opposing it on the ground that it does too much and he wants to protect the trust fund, but he is not willing to go to the contract authority." In short, "we are caught in this uncomfortable position of having done more than some wanted and less than others wanted." The conference report was "the best solution of the problems, the best compromise, hammered out on the anvils of mutual sacrifice, that we could possibly achieve."

The Minority leader agreed that they had worked hard to "maintain the integrity of the highway trust fund" and that the conferees "faced an impossible situation in a bad circumstance." However, "I happen to have the conviction that this is the wrong way to operate."

Representative Kluczynski called the bill "workable legislation" that met "the urgent need for extension of our essential highway program and the pressure for adjournment of the Congress, with the understanding that a thorough review of the highway-mass transit legislation would be undertaken early in the 93d Congress." He promised that "we shall consider whether an entirely separate fund should be established to provide the mass transit our major metropolitan centers must have."

Representative Clausen, one of the conferees, said he would vote for the conference report although he disagreed with some of its provisions. His strongest disagreement was with the 1-year extension of the Interstate System apportionment instead of the usual 2-year extension. To his "deep chagrin," the Senate conferees "would not budge" on the 2-year extension issue. His other deep concern was how "the Senate brought the controversial operating subsidies for mass transit and Title III into what was to have been a routine highway public works conference." The three Senate Banking Committee members had insisted on their Title III "at a time when we had neither jurisdiction over nor hearings on, the subject of mass transportation before the House Public Works Committee." He regretted, too, that the bill did not contain the House provision on priority primary routes.

He also discussed the idea of a Mass Transit Trust Fund:

> It is our desire to maintain the integrity of the highway trust fund by maintaining our entrusted fiduciary responsibilities, just as we should uphold the purpose and interest of the airport-airways trust fund . . . .
>
> There was more argument expressed by more Senators and House Members on the third trust fund concept than I have ever heard, including Mr. Mills, and other members of the Ways and Means Committee and Senator Williams of the Senate Banking and Currency Committee and other Senate and House conferees.
>
> As a matter of fact, the House offered, as part of their many proposals, the desirability of advancing the "Priority Primary" and third trust fund for mass transit as a package for immediate consideration next year.

He urged the House to approve the bill, for all its weaknesses, and then "let us come back next year, maintain the cooperation and momentum and move toward developing the best coordinated integrated and balanced transportation systems that modern and future technology can provide." [*Congressional Record-House*, October 18, 1972, p. 37137-37141]

The House interrupted to consider a bill amending the Federal Aviation Act. Before the Federal-Aid Highway Act of 1972 could be raised again, Representative John T. Myers (R-In.) initiated this dialogue:

> Mr. Myers. Mr. Speaker, I make the point of order that a quorum is not present.
> The Speaker. The Chair will count. One hundred twelve Members are present, not a quorum.
> Mr. O'Neill. Mr. Speaker, I move a call of the House.

A Call of the House was ordered.

> Mr. Mills of Arkansas. Mr. Speaker, a parliamentary inquiry.
> The Speaker. The gentleman will state it.

> Mr. Mills of Arkansas. Mr. Speaker, will the Speaker entertain a unanimous-consent request that the call of the roll be vacated?
> The Speaker. The Speaker does not have that authority under the Constitution. If there are any Members in the Chamber who have not answered and the Speaker can identify them, he will have them recorded. The Speaker does not have that authority, but he does not know of any such members.

When the Clerk called the roll, only 156 of the 432 Members of the House were present. In the lack of a quorum, the House adjourned *sine die*. [*Congressional Record-House*, October 18, 1972, p. 37199-37200]

Early on October 18, 1972, the Federal-Aid Highway Act of 1972 was dead.

Post-Mortems

The unexpected breakthrough by the Conference Committee had raised hopes that the 1-year compromise bill would be approved. It would have ensured that the pro- and anti-highway forces would be able to continue their argument in 1973.

The abrupt end on a quorum call, according to reporter Braestrup, "angered pro-highway forces, disappointed urban transit lobbyists, encouraged the environmentalists and pleased the Nixon administration, which opposed the bill's $400 million provision for mass transit operating subsidies." The end was more shocking because the bill was nearing approval by a simple voice vote when Representative Myers raised his point of order. Myers refused to explain his action, so reporters were left to speculate on his motivation, as Braestrup did:

> Myers was unreachable last night. But Republican House sources said he was angry because the bill no longer contained a House-passed provision barring any court interference with construction of the Three Sister Bridge, now stalled by environmental lawsuits.
>
> House Minority Leader Gerald Ford (R-Mich.) later said he had no part in instigating the Myers move. Other GOP members said White House lobbyists had no hand in it either.
>
> However, several administration lobbyists spoke earlier in the day of trying to persuade a congressman or senator to kill the measure, to save the President from a politically painful veto aimed at the mass transit subsidies provision.

Acting Majority Leader Tip O'Neill, whose Boston district included part of the unpopular Inner Belt, told reporters that the Highway Trust Fund was "no longer a sacred cow" in Congress. "It will be broken." [Braestrup, Peter, "Highway Bill Dies in Congress," *The Washington Post*, October 19, 1972]

Reporter Rosenbaum agreed on the subject of operating subsidies:

> The Nixon Administration engineered tonight the defeat of legislation that would have extended highway programs for one year and provided, for the first time, operating assistance for local mass transit agencies.

Republicans had refused to answer the quorum call, forcing the House to adjourn without acting on the bill. [Rosenbaum, David E., "G.O.P. Move Kills Road Fund Bill," *The New York Times*, October 19, 1972]

A few days later, Rosenbaum published a more detailed analysis of "one of the fiercest behind-the-scenes battles in Congress this year." The battle had been fought by insiders, such as Richard J. Sullivan, chief counsel of the House Public Works Committee; Alfred E. Johnson, AASHO's executive director; Joseph A. Bosco of Secretary Volpe's staff; Fred B. Burke, "the archetypical lobbyist—persistent, persuasive, and knowledgeable" hired by transit organizations and agencies; and John Kramer, the 24-year old head of the Highway Action Coalition formed with the "stated purpose" to "bust the highway trust."

Secretary Volpe had begun the struggle with his Single Urban Fund proposal that would allow local officials to use Highway Trust Fund revenue to buy buses and build commuter rail systems. In the past such proposals never had "much political muscle" behind them, but now it was coming from a Secretary of Transportation who had been the Federal Highway Administrator at the launch of the Interstate program.

Sullivan, Johnson, and their allies made clear to Members of Congress that the proposal was not acceptable. The pro-highway forces made their views known along with campaign contributions to the key congressional leaders. As for the anti-highway forces:

> Mr. Kramer, however, was not sitting on his hands. A novice at lobbying, he learned quickly. He planted ideas in the minds of newsmen, and, by summertime, favorable articles had appeared in publications including The New Republic and Business Week.

He rounded up support from Senators Cooper and Muskie and Representative John Anderson. Meanwhile, Burke was working with Senator Williams and other members of his committee to gain support for operating expenses.

These contacts and those from Bosco with every member of the Senate Public Works Committee resulted in the 8 to 7 vote in favor of the Cooper-Muskie amendment. "Mr. Bosco could hardly believe his success, but it was short-lived" because Senator Stafford changed his vote overnight:

> Whether one of the highway lobbyists or another Senator persuaded Senator Stafford to switch is unknown . . . . Mr. Bosco called Mr. Stafford. Mr. Volpe called him. It was to no avail. The vote stuck.

The Stafford switch appeared to kill Cooper-Muskie, but Bosco was optimistic. "Just wait," he said, "I think we've got the votes on the Senate floor." He was right, with the Cooper-Muskie amendment passing by a 48-to-26 vote.

In the House, Sullivan of the Public Works Committee was assisted by minority counsel Clifford W. Enfield, formerly general counsel of BPR; Lloyd A. Rivard, a committee staff highway engineer; and former Administrator Frank Turner, now a consultant to the committee. The committee's final bill contained no funding for mass transportation. "Even worse, from Mr. Kramer's and Mr. Bosco's point of view, the staff had written a provision into the bill calling for an additional 10,000 miles for the Interstate System."

Any hope for the Administration would be on the House floor. The key obstacle was a parliamentary problem. "The House parliamentarian had ruled in the past that amendments similar to the Volpe plan were out of order, since the legislation was not a tax bill." They tried to convince the House Rules Committee to prohibit points of order, but lost by a single vote. Next, Representative O'Neill, the Democratic whip (essentially the vote wrangler and counter) spoke with Lewis Deschler, who had been House parliamentarian for 4 decades:

> Mr. Deschler reportedly promised Mr. O'Neill that he would rule that the amendment was in order.
>
> By the time the bill reached the House floor, however, Mr. Deschler had changed his mind. He announced that he would rule the mass transit amendment out of order.
>
> Several Representatives said that Representative Carl Albert, the Speaker of the House, had prevailed upon Mr. Deschler to change his position. Other Representatives said it was Representative Wilbur D. Mills, the Chairman of the Ways and Means Committee. Mr. Deschler refused to say why he switched.

Following passage of the House bill, the Conference Committee met for 40 hours over 5 days. "Lobbyists crowded the hallways outside the meeting rooms. But time and again the negotiations broke up, deadlocked on the transit issue." Rosenbaum continued:

> At midnight on Saturday, Oct. 14, the conference broke up, supposedly for good. But Mr. Johnson and the other highway advocates went to work. The bill could not die, they said, or the states would be out of money. Senators and Representatives were flooded with phone calls from their constituents.

On Wednesday, October 18, the conference had reconvened and reached agreement on the 1-year extension. The Senate approved the bill with little debate and the House was expected to approve it before adjourning:

> But the Administration officials were not satisfied. They wanted to kill the bill, believing that if the highway advocates were in dire need of more highway money early next year, they would be willing to accept any bill, even one that let the trust fund be tapped for mass transit purposes.

> Somehow, someone then engineered a quorum call on the House floor. Republicans, presumably at the Administration's behest, refused to answer it, and the House was forced to adjourn, killing the highway bill for the year.
>
> Mr. Bosco said that night that the Administration had planned the maneuver. The next day he said he knew nothing about it. But, he said, he was enormously happy with the outcome.

Burke and Johnson telephoned their allies with the bad news. Sullivan began working on the new highway bill:

> And John Kramer, who had been through [none] of these experiences before, began inviting friends to a victory party, confident that he would win his fight next year. [Rosenbaum, David E., "Lobbyists Powerful in Road Fund Battle," *The New York Times*, October 24, 1972]

An editorial in *The Washington Post* tried to summarize what had happened. Following Senate adoption of the Cooper-Muskie amendment, the editorial said, "the guardians of the highway trust fund [in the House] had to pull out all parliamentary stops to block a pro-transit amendment."

The Conference Committee had, of course, been contentious:

> Though reports of the dealings conflict, it appears that the House conferees managed to drive a wedge through the Senate ranks by offering to accept $4.4 billion in mass transit aid—as long as it all came from general revenues, leaving the trust fund inviolate. This was agreeable to Sen. Jennings Randolph, chairman of the Senate conferees; Sen. Harrison Williams, the chief Senate spokesman for mass transit aid; and lobbyists for the mayors. But the deal was blocked by Sen. John Sherman Cooper, who controlled a majority of Senate votes in the conference. Sen. Cooper held out for opening up the trust fund or, as a last resort, for shelving the issue only till next year. At one point, the conference broke down in angry disagreement . . . .

They finally agreed on an interim bill that died when the House "failed to muster a quorum and adjourned for the year."

This unexpected end was discouraging, but the editorial had a different reaction:

> The most troubling element in all this is the myopia displayed by those mass transit advocates who leaped at the bait of billions from general revenues—billions which might be impounded—and were willing to forsake the goal of reform. In a bitter, late-night floor speech, Sen. Williams called for "soul searching on the question of whether the effort was to aid mass transit or to break up the highway trust fund."

The outcome could not be known, but the debate would be resumed in 1973. "Indeed, the friends of road-building are already gearing up for the next round, as if they sense, as we do, growing public interest in taking—and staying on—the path of reform." ["Roads Not Taken," *The Washington Post*, October 24, 1972]

An editorial in *The Baltimore Sun* predicted "a big fight early in the next Congress" over the highway bill. Many States would be running out of money by the start of the next fiscal year on July 1, 1973; some will have been forced to quit road building while waiting for a new bill. The highway lobby would continue to oppose use of Highway Trust Fund revenue for rail mass transit facilities:

> Will they relent next year, believing that only by doing so can they get a highway bill through Congress in a hurry, thus avoiding work stoppages in many states? Or will they use the increased pressure from state officials on members of Congress to make sure that there is no consideration of mass transit?
>
> Our guess is that the highway advocates will follow the latter course, and be successful in it, unless mayors and others who want mass transit money in Congress begin the minute the new Congress convenes. We urge them to, for the time has certainly come when the life or death of such cities as Baltimore depends on a wise—and new—transportation policy. ["The Next Highway Bill," *The Baltimore Sun*, October 24, 1972]

The impact on highway programs was felt soon after the 1972 bill died in the House. FHWA expected nine States to have problems: Arkansas, California, Florida, Kentucky, Michigan, Missouri, Tennessee, Texas, and Virginia. They would be short of their funding ceilings by a combined $295.7 million. A summary in *The Wall Street Journal* added:

> The Federal Highway Administration also says that because of federal limits on spending in interstate, urban, and other individual highway categories, there are 36 states that could fall a combined $431.5 million short of the spending limits in fiscal 1973, lacking new apportionments. But it's understood the Nixon administration plans to let the states temporarily switch funds between these categories to avoid this problem.

Tom Lewis, in his 1997 book *Divided Highways*, wrote about the demise of the Federal-Aid Highway Act of 1972, in part based on an interview with former Administrator Turner. Lewis recounted the parliamentary dispute on October 3 and 4:

> On October 3, the House Rules Committee . . . added a special directive allowing members to raise points of order against any attempt to add mass transit funding. To circumvent the committee's decision, Congressman [John] Anderson went to the House parliamentarian, the ultimate authority in such matters, who assured the congressman he would rule that his motion to amend the bill for mass transit funding was in order. Anderson would have no need to worry. His amendment would come to the floor. But on the morning of October 4, the parliamentarian ruled with the highway lobbyists because of the request of one of the most powerful representatives in Congress, the head of the House Ways and Means Committee, Wilbur D. Mills . . . .

> Just before the House took up the highway bill, Wilbur Mills announced that any change in the trust fund should originate with his House Ways and Means Committee, as it had written the original trust fund legislation in 1956, and it alone had the power to alter it. He would tolerate no amendment of the sort Anderson proposed to make. That Wilbur Mills took such a position was no surprise. Before entering Congress [in 1939], he had served as a judge (an administrative leader) in White County, Arkansas, where he had charge of highway building. It was there he first met the regional administrator [actually area engineer] of the Bureau of Public Roads, Francis Cutler Turner. The two men had been friends ever since and shared the same philosophy about highways.

During the Conference Committee, Senator Cooper "became adamant that the final legislation include Highway Trust fund money for mass transit." This was his final negotiation before retiring "and he wanted to go out with honor." Lewis continued:

> Meeting after meeting of the conference committee ended in deadlock. It was now mid-October in an election year; senators and representatives were anxious to return to their states and districts for the campaign. The Gallup poll showed President Nixon leading his hapless Democratic opponent, George McGovern, by as much as thirty-four percent. Many in Congress wondered if the coming Republican landslide might sweep them from office. Finally, on October 18, the joint committee reached a decision to appropriate $3 billion from the general fund for mass transit and rushed the bill to the floor of the House.

Many transit advocates, as discussed earlier, were suspicious of the compromise because the funds were a few years off and subject to appropriations and impoundment. With the bill seemingly certain of House passage, "Those who wanted to crack the trust fund had one maneuver left," namely the quorum call. Representative Mills tried to override the quorum call but when Speaker Albert said he could not do so, the bill died. [*Divided Highways*, p. 228-230]

The States that had been most aggressive in using their Federal-aid funds were the ones most likely to feel a pinch:

> "The states in the worst fix are the ones that are out ahead of the rest," in terms of vigorous programs, a highway administration spokesman says. [Karr, Albert R., "Highway Bill Delay in Congress Threatens to Disrupt Construction in Several States," *The Wall Street Journal*, October 23, 1972]

On November 3, Senator Williams wrote a letter to the editor of *The New York Times* "to review the reasons for the failure of the conferees to come up with a piece of legislation that could be enacted into law." He summarized the final compromise on October 18 and noted Senate approval of the bill. The bill died "when one House member demanded a quorum call." He explained that, "Three-quarters of the Republican members failed to answer the quorum call, and the House was forced to adjourn." He had no doubt about why the Republicans failed to respond:

> It is well known that President Nixon is flatly opposed to helping commuter lines meet operating costs. There had been broad hints throughout the conference that he would veto

> this bill because of the operating subsidies provisions, and millions of Americans would have been outraged if this had been done.
>
> They now have every right to be just as angry when he has one of his Congressional agents from a rural district kill this legislation through a quorum call. The Administration has even bragged about initiating the parliamentary maneuver which killed the Federal-Aid Highway Act.
>
> These are the facts. Now it is up to the American people to judge who is really to blame.

Senator Williams, writing on November 3, may have intended to influence the presidential election on November 7, but his letter was not published until November 16. [Williams, Harrison, A., Jr., "Death of Federal Highway Act," *The New York Times*, November 16, 1972]

Secretary Volpe issued a statement on October 26 saying he was "particularly disappointed that legislation which would permit the Federal-Aid Highway program to continue was not enacted before the 92nd Congress adjourned." Because disruption in the program was "not in the national interest," he had sought and received from President Nixon "the authority to ensure that the federally-assisted portion of our Nation's highway program can continue while Congress considers how it can best be responsive to the transportation needs of all our citizens."

The Secretary had directed Acting Administrator Bartelsmeyer "to work with all States where the lack of highway legislation impacts on their highway program." Bartelsmeyer could do the following:

1. Where necessary, to release States from the categorical restrictions now placed on the obligation of Federal-aid highway funds so that maximum use can be made of their available unused authorizations;
2. Permit States to utilize existing authority to undertake Interstate projects for which they can be reimbursed when a new highway law is enacted.

A statement from Bartelsmeyer was appended to the Secretary's statement. With the increased flexibility, "most States will have the necessary authorized funds to carry out the highway program at its current obligation level if the Congress acts expeditiously." He was optimistic about obligating $4.4 billion for Federal-aid highways in the current fiscal year (FY 1973).

U.S. News & World Report published an article in its issue of November 13, 1972, titled "As Funds Run Low for New Highways." It stated that the "controversial federal highway program," which already was running into objections from environmental groups, was now "facing another problem: lack of funds." Virginia was one of the worst hit. "We've used every cent we have," Douglas Fugate told the reporter. "Our Interstate program is at a standstill until new federal funds are released." He cited I-77 between Wytheville and the West Virginia border as an example of a project that was being delayed. The article continued:

> Kentucky and Tennessee have almost used up their Interstate funds. Kentucky had $900,000 left and Tennessee $500,000.
>
> At least six other States—Arkansas, California, Florida, Michigan, Missouri and Texas—also will be short of federal money by June 30 if Congress doesn't come through with new authorization [sic] early in the next session. ["As Funds Run Low for New Highways," *U.S. News & World Report*, November 13, 1972, p. 4]

A panel of city and Federal officials met at the Owens-Corning Fiberglass Center on Fifth Avenue in New York City on November 11 to discuss the future of transit systems. The occasion was an exhibition of advanced transportation concepts, including people-movers, personal rapid-transit systems, and an electric-powered car with a long, pointed glass-fiber "snout." The panelists agreed that such innovations would have little impact on the present. Mr. Jaquelin T. Robertson, Director of the Office of Midtown Planning and Development, said, "Everything here is Buck Rogers. It's not going to change our lives for many years to come." Mr. Jerome Kretchmer of the city's Environmental Protection Administration called the electric car, with its long "snout," a "menace," adding, "No one is really working to provide a transportation system that will work in our environment."

Robertson, who was working on a proposed Madison Avenue pedestrian mall, said that instead of focusing on "money and technology," officials should look to short-term solutions. "We will have to use existing technology and existing rights of way for the next 10 years, maybe 15." He favored such developments as "maxi-cabs and mini-buses, limited-size trucks, and a reapportionment of street use, banning autos from many central city areas." Such a ban was essential because, he said, "The automobile is a hopelessly inefficient carrier of bodies" in the urban environment. Existing funds, Robertson said, should be used to foster "pedestrianism and jitneys in the central city, and trains for intercity travel." Any money left over "can be spent diddling around with far-out things."

Deputy Administrator William Allison of UMTA agreed that items such as the people movers, which his agency was studying, were for 10 years or more from now. Long-range planning was necessary, but UMTA was committed to short-term planning as well. One research project could provide a new urban bus by 1974, while research in New York City included a gas-turbine commuter car for the Long Island Rail Road and a stored-energy braking system for the subway.

Representative Koch was also on the panel. He expected his bill to open the Highway Trust Fund to mass-transit uses to reach the House floor in January. There, it would encounter "the hardest fight imaginable" because of the powerful highway lobby. (It was unlikely a highway or mass transit bill, or any other, would reach the House floor in January, which the new Congress would devote to organizational issues, but the report of the conference cites his statement.)

Robert N. Rickles of the Institute of Public Transportation recommended outreach to the public to garner support for mass transit:

> Transportation is the only environmental issue on which we can excite the majority. It's not a white, middle-class, elitist issue. It's a political issue and the middle class and the poor

> must join together to demand what they are entitled to. We've got to convince people that transportation is important and that it can get better. [Prial, Frank J., "Officials Urge Better Transit System for Today, Not the Future," *The New York Times*, January 12, 1972]

AASHO held its 58th annual meeting in Phoenix on November 27. Dingwall of Texas, in his speech as outgoing president, acknowledged the "changing of the guard in the leadership of the United States" that had taken place in 1972. The departures included Frank Turner and "friends from the Halls of Congress," including some who participated in revitalization of the program in 1956:

> The old guardsmen, like the sentinels at Buckingham Palace, have personified the qualities of loyalty, discipline and dedication. Straight and stalwart, they steadfastly refused to be distracted from their duty.

Looking back over his year as AASHO president, Dingwall said:

> We have been active in the defense of the Highway Trust Fund. Most of the time it has been a rear guard action against self-serving bands of guerrillas, and at other times, we have faced well-meaning but generally uninformed people who have attacked the program . . . .
>
> To understand this, I think one must understand what's going on in our society. Highways are under attack from all directions. I think that this is so because there is a substantial protest subculture in the United States whose chief targets are the *successful* elements of the so-called Establishment. There is an amazing lack of protest over the failures of other programs. But show me a successful program, or organization, or institution and I'll show you a target for these attacks.

Still, he was not pessimistic. The challenges could be met "if we are willing to pitch in and work for continued progress in the highway program in each of our States and in the nation." He had observed some change in attitude in Congress. "The uncompromising hyper-idealism which has run rampant in the past five years now is being tempered with realism."

The key was to "return to the Federal-State partnership basis." To do that AASHO first must strengthen its headquarters staff "with additional well-qualified personnel to provide for continuous review of policy and legislative matters." Second, AASHO must accept that its duty was "not just to defend the highway program, but to inform legislators on the State and national levels of the needs for highways and of our accomplishments."

One thing was clear. "The need for highways, then, is not going to decline, but accelerate." As for mass transit, "let us not sit back with a 'dog in the manger' attitude, but let us cooperate and assist where we can." Highway officials "can share our knowledge, cooperate with other modes and still hold out for the sanctity of the Highway Trust Fund." This cooperation would "dispel the myth that we are opposed to mass transit in all its forms and manifestations." They were opposed only to the use of highway funds for transit. "If it's a trust fund that mass transit needs, I say let's help them get it, but with the understanding that they stop trying to break up ours."

He urged AASHO members to act:

> Without blaming anyone or any group, without pointing the finger, and without rancor, let's all talk to our congressional people and see if we can't get this bill going again in the very early days of 1973. [Dingwall, J. C., "President's Annual Address," *American Highways*, January 1973, p. 3-4, 17-18]

Dingwall, who had joined the Texas Highway Department in 1928, was one of those exiting the scene. He retired on January 31, 1973. ["J.C. Dingwall Retires as Texas State Highway Engineer," *American Highways*, January 1973, p. 18]

The new president of AASHO would be Thomas F. Airis, Director of Highways and Traffic for the District of Columbia. He had joined the U.S. Army Corps of Engineers in 1929 and had served in the military through World War II and during the Korean War. After working on the U.S. section of the St. Lawrence Seaway, he joined the District's Department of Highways and Traffic in 1959. He became director in 1964. ["Sixty-First President of AASHO," *American Highways*, January 1973, p. 17]

Acting Administrator Bartelsmeyer also addressed AASHO. Thirteen years ago, he said, he had addressed the organization as its president. "It was an honor I have always cherished, and it is one of the highlights of my 40-some years in the highway field."

(Bartelsmeyer's presidential address had taken place in Boston during AASHO's 45th annual meeting in October 1959. He had addressed the fiscal crisis facing the Interstate program as a result of accelerated funding to counter a recession in the absence of an increase in revenue; attacks and criticism of the program ("It must be realized that when any individual public financed endeavor gets as big as the highway program, such things are sure to occur."), accusations of corruption, the talk of increased Federal controls, changes in contract authority, and proposals by critics and local officials to curtail construction of the urban Interstates. On this topic, he said, "Since some of the greatest and most acute needs for adequate modern highways exist in the urban areas, it is inconceivable that a sound and well balanced Interstate Highway System should not include extensions into these areas.")

The 58th annual meeting, he said in 1972, was taking place "in a troubled time" with "some dark clouds hovering over us at the moment." He reminded them that "AASHO has met in troubled times before, and adversity – of whatever nature – has always been overcome." He quoted Shakespeare's *The Tempest* ("The morning steals upon the night, melting the darkness") and added, "Our dark hour will also pass."

He explained the steps Secretary Volpe and he were taking to keep the Federal-aid highway funds flowing despite the absence of congressional action to extend the program. "With this increased flexibility, most States will have the necessary authorized funds to carry out the highway program at its current obligation level . . . ."

The Administration favored early action on highway legislation in 1973 to avoid any funding lapses, but he wanted to make clear that there would be "no retreat from the general position" the Department had taken in 1972. In 1973, the Department would again support the pass-through provision that would provide Federal-aid urban funds directly to urbanized areas to use as they thought best, including for rail transit. In submitting legislation in 1972, the Department "thought *then* that this was desirable and necessary. We think *now* that it is desirable and necessary." In view of the "overwhelming problem of rush-hour traffic congestion," local elected officials "are in a much better position to decide how to spend their Trust Fund dollars than anyone else." The Department believed this change was proper "because, after all, anything that we can do to eliminate or reduce congestion is beneficial to the highway systems of those areas, and the motorists who use them."

He assured AASHO that Secretary Volpe would have said the same thing if a prior commitment had not kept him away:

> Incidentally, I know that there are some who feel that Secretary Volpe – who was the first Federal Highway Administrator back in 1956 – has turned his back on the highway program, that he has deserted it. This simply is not true. Believe me, at the Department I sit in many personal meetings with him, and I can tell you unequivocally that he has not relaxed one iota his concern over highways. His concern and commitment remain as deep and sincere as they have always been . . . .
>
> However, John A. Volpe is Secretary of *Transportation* – not Secretary of Highways. This is the crux of the matter. He must view transportation as a master plan, as a whole, rather than fragmented modes, or independent parts.
>
> And I submit that this is what we, as highway officials, acting in our role as an integral part of the total transportation endeavor, must also do.
>
> According to a Japanese proverb, "A small-minded man looks at the sky through a reed." Let none of us look through a reed; let us look, instead, at the broad sweep of the whole sky – the total transportation problem.
>
> Let us think not of ourselves only in the narrow, restrictive confines of highway engineers; rather, let us think in broader, more sweeping terms as *transportation* officials.
>
> Let our vision be broad and unlimited, and unclouded by vestiges of policies and procedures that once were considered highly desirable, but which are no longer applicable to today's dynamic American society.

Bartelsmeyer said he knew the members of AASHO, had been one of them, had worked with them, and he shared their pride in all they had accomplished as well as the many obstacles they had overcome. "However, life is a treadmill, and there is little time for us to relax and think about past accomplishments." Now, they must accept that the Federal-State highway program "has entered a new era – an era in which the role of highways is a changed one, but *not* a diminished one."

Highways remained vitally important, but today highway officials "must consider always where and how they must interrelate with the other transportation modes."

That is why the Department of Transportation was created, namely "to bring *all* of the transportation modes – highway, rail, air and water – together in a coordinated, unified program." They "must be completely coordinated into an overall transportation system if we are going to be able to measure up to our mandate." He continued:

> You, the members of AASHO, are being given the opportunity – now – to assume the leadership in this total transportation challenge. If you do not accept it, someone else surely will! I say let's accept this challenge eagerly and enthusiastically; and, as highway officials, let us measure up to the same high level of performance that we have always been capable of in the past. [Bartelsmeyer, Ralph R., Address, *American Highways*, January 1973, p. 9, 24-25]

On the afternoon of November 27, the featured event was a congressional panel discussion with Representatives Kluczynski, Wright, and Clausen from the House Committee on Public Works. Dingwall, in his role as moderator, began by asking about Secretary Volpe's intention to submit a bill in 1973 that included the pass-through for Federal-aid urban funds and the local option to use the funds for bus or rail transit. Representative Kluczynski cited the Department's 1972 National Transportation Report to demonstrate the size of highway needs:

> It seems ridiculous to me in the face of these facts to take money out of the Highway Trust Fund for mass transit or for any purpose other than highways. All this kind of action amounts to is robbing Peter to pay Paul, with both of them actually ending up in the poor house.

He advocated retaining Highway Trust Fund revenues for use exclusively for the Federal-aid highway system. He supported increased funding for mass transit from some other source. In fact, in response to a later question, he pointed out that Title III of the bill that came out of the Conference Committee "contained the largest and most comprehensive transit program ever to come before Congress." It contained an additional $3 billion from general revenues "over and above" previously authorized funds as well as "for the first time operating subsidy authorization" of a total of $400 million in 1973 and again in 1974. "Can you imagine a highway bill with such a big boost for mass transit?"

He explained that "there was not general agreement in the conference that general fund monies should be used for transit." He explained:

> You highway administrators know this only too well because you all received, in a move unprecedented to my knowledge in the history of Congress, a telegram from seven of the Senate conferees which indicated the thinking of some of the Senate conferees implying that they had given in on the Cooper-Muskie proposal to take mass transit funds from the Trust Fund. What they neglected to say was that the only reason they wanted a one year extension of the ABCD program instead of the two years which was in both bills, was to insure that

> the subject would have to be treated again early in the next Congress. As it turned out, of course, we have no bill and not even a one year extension, so those people got their way anyway.

He favored a third trust fund for mass transit. The idea had considerable support in the House and among transit proponents:

> Of course there are many people who profess to be in favor of a transit program, but are in reality simply opposed to highways. These people will undoubtedly find reasons to oppose a transit trust fund. But you people are just as aware of this situation as we are, and we will all have to face up to it and do everything possible to create this third trust fund, and I'm for that 1,000 percent.

He added that, "The highway opponents don't care how much public money has gone down the drain, but I care and so do you."

In concluding comments, Representative Kluczynski told AASHO that, "When you come before us next year, you should tell it like it is and lay it on the line." He wanted them to feel free to say anything they want to say. "You can't insult us." Talk about how the absence of a bill and impoundments increase unemployment. Discuss the cost increases resulting from delays. Let it be known "what the singlemindedness of the opponents of the highway program have caused and who is footing the bill."

He predicted that Secretary Volpe "will probably have some bright and shining new proposals for us developed from the warmed-over remains of what they have sent us before, and justified by reaching into the cloudy unknowns of the Office of Management and Budget." The committee was "behind you as always . . . but the fight is getting tougher."

Speaking of robbing Peter to pay Paul, Representative Kluczynski joked about the popular folk singers Peter, Paul, and Mary. "Now I didn't mention anything about Mary, but you can be sure if you start taking money from Peter to give to Paul, that pretty soon Mary is going to get a little suspicious and want her share, too." Representative Clausen picked up on this comment in discussing his support for a third trust fund:

> In my view, instead of raiding the one trust fund wherein as he said robbing Peter to pay Paul and then opening the door for Mary to fiddle around a little bit, it seems to me what is needed instead of everything trying to divide up a single pie, I believe we ought to have another pie.

He said that, "if there is so much interest for mass transit in this country, let's have the people put their money where their mouth is, let us create the vehicle at the Federal level."

He did not favor a broader trust fund. "Knowing the plight of the situation, you are going to create a single grab bag, and it will be a power play from this day forward as to which one is going to have the most to say about where the allocation will go." He favored hearings and studies to determine needs, estimates of costs, and methods of financing. "I think if we did that we would have a more realistic approach to the total problem."

He believed in a nationally coordinated transportation system, but warned AASHO that, "I can tell you that unless you unite and do your homework, you can find yourself on the outside looking in." Even as AASHO was meeting in Boston, the principal advocates for using Highway Trust Fund revenues for rail transit, namely the National League of Cities, were meeting to discuss this issue and lay out a strategy for achieving their objective. Noting that the House would have 63 new Members, he said:

> I can suggest to you that you had better go back home and communicate the problems that you have, not only with your local city and county officials (because we found on the one side it was the League of Cities that were principal proponents for mass transit), as well as with the counties and the governors who wanted to maintain the integrity of the Highway Trust Fund. And, I would suggest all of the trade organizations, be it Labor, Management, whoever it might be, needs to know the story, you and they need to get the message to their Senator or to their House people so that they have an understanding of what the real facts of life are as relates to the highway system.

Representative Clausen also discussed the proposed 10,000-mile priority primary network. He said that within the committee, support existed for extending the Interstate System after it was completed later in the decade:

> But in the wisdom of the committee itself, it felt that what should be done is to go back to the needs study report and come forth with a 10,000 mile intermediate highway program based upon priorities that would come from the States in cooperation with the local units of government.

The priority primary routes "could provide the nucleus, in conjunction with other improvements that we might make, to have, as an example, a safer route of travel for the trucks and the highways and the automobiles."

Pulling his topics together, Representative Clausen said that "the only way this is going to come about is for you to educate many public officials and start talking to some of the people in Congress."

Dingwall asked Representative Wright to discuss the safety elements of the 1972 bill. "I think all of us would have to agree," Wright replied, "that safety is what it's all about." Highway accidents were "the third most prolific killer of Americans when we consider all causes, following only heart disease and stroke." Well-engineered roads such as the Interstate highways "definitely can save human life."

The 1972 bill was "a forward-looking approach to try to do still more about highway safety in an effort to save American lives." He discussed provisions such as funding for high hazard locations, including otherwise well-engineered roads, where built-in death traps exist. "We discovered that you can apply money and effort and intelligent direction to those particular spots with dramatic results."

Representative Wright also said all these efforts would be meaningless unless we "keep highway construction at a level that will sustain safe highways.' He continued:

> There has been a lot of rhetoric about paving the country over with superhighways; some people want to quit building highways. Well, that, after all, is begging the question. To follow that line of reasoning to its logical conclusion, you would come up with a pretty cold-blooded formula – just to let people get killed on inadequate highways. Maybe they won't buy any more automobiles. I for one do not believe that.

The Highway Trust Fund must be limited to "the ongoing coordinated highway program with all the safety features we can build into it for two or three very important reasons." First, the Congress had made a commitment to the American motoring public: "Put up the taxes and we will build you better roads." Second, "we just don't have any surplus in the Trust Fund – certainly no surplus to our own needs. We need every penny." Third, better roads save lives. Regardless of the demands for transit or other modes, "I can't think of anything more important to the life, health and safety of the American public than an adequate highway program."

Representative Wright, in his concluding remarks, gave AASHO the same observation he said he had given to a graduating class:

> As we look to the future, all of us are going to have to broaden our perspective and see the bigger picture, and the thought I want to leave you with is that the fact that we can forgive the child for being afraid of the dark, but the tragedy of our lifetime is when grown men and women are afraid to see the light.

Moving forward, "we do want to approach these things with open eyes and a view to the future – not a partisan view, but an American view." He solicited AASHO's help, advice, and constructive criticism. "The Congress is an imperfect instrument and one of the most criticized." To do what people need done, "we need your help, we need your counsel. ["Congressional Panel Discussion on the Future Federal-Aid Highway Program," *American Highways*, January 1973, p. 6-8, 29-33]

Leaders of ARBA and AGC also addressed AASHO. E. J. Peltier, ARBA's president, reminded AASHO that one of the most important legislative achievements of the 92nd Congress had been approval in October of general revenue sharing. Funds totaling $30 billion would be made available to State and local governments for all types of ordinary and necessary capital expenditures as well as maintenance and operating expenses. The funds could be used for roads as well as transit operating subsidies:

> Some of you, perhaps, have forgotten about Special Transportation Revenue-Sharing. The proposal . . . has lain dormant in Congress. In essence, it involves a pooling of the revenues from the Highway Trust Fund, the Airports and Airways Trust Fund, and funds appropriated for the urban mass-transit program. This pool of money was to be distributed to State and

> local governments for application to any transportation program whatsoever, including maintenance and operating costs.
>
> The program presented last spring by Secretary Volpe, which centered around the proposed Single Urban Fund, is a step in the direction of Special Transportation Revenue-Sharing.
>
> The Cooper-Muskie Amendment to the 1972 Highway Act . . . represents a much smaller step in the same direction . . . .

If funding were made available on a "no-strings-attached" basis, he said, "there is no doubt that many cities will use this new funding to meet the operating deficits of their public transportation systems." That was understandable, but the Federal concern must be different, namely "to insure the development of an efficient transportation system" throughout the country. The Federal investment must be restricted to capital projects. If used for operating subsidies, "it will cease to be an investment." If operating subsidies were allowed, they would "involve a watch-dog operation to make sure the subsidies paid out are not frittered away." He explained:

> The problems associated with Federal operating subsidies for transit are similar to those associated with Federal aid for highway maintenance [which was prohibited]. In essence, the activities are not of a sort that can be adequately audited at the Federal level, and if the attempt is made, a mountain of red tape will result.

When the 93rd Congress convenes in January, he said, it would consider legislation for highways, airports, and urban public transportation. He urged AASHO to make clear that all are underfunded and that the Department of Transportation "has a responsibility to relate its legislative requests to the needs of the programs." While he acknowledged that "local transportation decisions can be made at the local level," he believed that "the Federal government also has a responsibility to exert leadership in developing a national transportation system." [Peltier, E. J., Remarks, *American Highways*, January 1973, p. 11-12]

The AGC's William Dunn was optimistic that the Vietnam War would soon be over, with funding no longer needed for that cause put to use building a better life at home. In the absence of a highway bill, "we must now seek solutions" based on fundamentals. First, a "Trust Fund" must be considered "a trust in every sense of the word." He said, "There can be no compromise on this principle." A separate trust fund was needed for mass transit, not one in which "Paul and Mary would be stealing from Peter." Third, if the public learned that the taxes it paid into the Highway Trust Fund were used for a different purpose, "they must speak out against it." In short, maintaining the integrity of the Highway Trust Fund was vitally important:

> We will not be coerced, cajoled or stampeded into a compromise on this basic principle. No matter how bad it hurts, once you compromise on principle, especially on as basic, as fundamental and as sacred as this; you're dead . . . . We simply have no right to tamper with trust funds; that is the right of the parties to this trust the American taxpayer, the American motorist, and his Government [sic]. [Dunn, William, Remarks, *American Highways*, January 1973, p. 14]

Carroll Quimby, president of the League of American Wheelmen, also addressed AASHO. He warned AASHO "to prepare for the great cycling syndrome that is sweeping our country." He said AASHO didn't have to take his word for it. He said to "just look around you; there is no escaping it." He said that, "Only the highway lobby is resisting . . . being dragged kicking and screaming into the America of the mid-70s."
He acknowledged that bicycles had equal rights to the road, but said that bicycles "can in no way compete with the automobile for the right to use the same roads." The ideal would be bike paths consisting of an 8-foot lane separated from traffic by barriers, hedges, and grade separations. He urged the State highway officials to accept that funding for bikepaths should come through established Federal and State highway departments. One thing was certain:

> It is projected that by 1975 there will be over 100 million cyclists in America, or every other American on a bike. Speaking to you as a representative of those cyclists, one way or another, we're gonna get you. ["Highway Officials are Warned to Plan for 'Cycling Syndrome'," *The Phoenix Republic*, November 28, 1972]

Tom Wicker, in his *Times* column on December 5, 1972, wrote about "Busting the Highway Trust":

> The Highway Action Coalition estimates that opening the massive Highway Trust Fund for some form of spending on mass transit projects "is a more likely possibility during the coming year than ever before." But neither the coalition nor anyone else interested in slowing the highway juggernaut can afford to consider the victory inevitable.

The coalition cited three defeats for the highway lobby in the past year as one cause for optimism:

> It was unable to have a percentage of alcohol tax receipts diverted into the trust fund, to stop construction of the Washington, D.C., subway system, or to win passage of a bill appropriating [authorizing] money from the trust fund without inclusion of a provision that a small portion could be spent for mass transit projects.

The election was another positive sign according to coalition headcounts:

> About 60 per cent of the House members who were defeated or retired were pro-highway, while only about four-fifths of their replacements seem to be so oriented. The Senate count is virtually unchanged, but that makes little difference; last year, the Senate passed the Cooper-Muskie amendment, which would have permitted mass transit projects to be financed from the trust fund, by about two to one.

Further, with much of the rural Interstate System completed, "the emphasis of the highway builders now is on urban projects that gobbled up land, ruin neighborhoods with air and noise pollution, scatter our cities into patternless chaos, and force more and more people into more and more automobiles for which there will never be enough parking until the country is paved over."

The final reason for optimism was that public support was growing steadily, as was support from public officials. Wicker cited Governor Sargent's new master plan for transit rather than highways in Boston, as well as the battles citizens were waging in court, legislatures, and administrative agencies "against big highway projects all over the country. In a Harris poll, 54 percent of respondents placed "higher priority on improving rail transportation rather than bus and air travel.

Still, it was not going to be easy. "No one ought to discount . . . the power and finances of the highway lobbyists," as Wicker explained:

> Now that they know how strong their opposition is becoming, after years when they were virtually unchallenged, they can be expected to fight to the last campaign contribution and the last big project dangled in front of some dazzled Congressman's nose. [Wicker, Tom, "Busting the Highway Trust," *The New York Times*, December 5, 1972]

The editor of *Better Roads* magazine, Frank Reid, was aware of the stakes facing the highway community. This might not be evident from the cover and contents of the December 1972 issue of the magazine "for Federal, State, County, Township, and Municipal Officials, Engineers, and Prequalified Contractors." The cover depicted a new Warner & Swasey 880 Gradall tearing out a stretch of concrete pavement on Arlington Road in Akron, Ohio. The contents covered the usual mix of articles – optically programmed traffic signals, equipment tips from the convention of the American Public Works Association, and a *Better Roads* forum on "Winter patching: what materials?"

Reid's editorial, however, saw the coming battle in stark terms. With the highway program "temporarily up for grabs," he said, "it is long past time to review some basic facts regarding the Highway Trust Fund." He continued:

> The purpose of the user tax was to improve highways. Funds were collected from highway users. The funds were distributed by formula to build the Interstate System. The Interstate System was not yet completed. Needs off the Interstate System are growing. Through impoundment, millions of dollars of Highway Trust Fund revenue had been withheld "in the name of economic stabilization.

This withholding created an artificial "surplus" that had "become an attractive target for other transportation modes that, for a variety of reasons, can not support a similar user-oriented tax." The final fact was:

> The existence of a group of irresponsible men in the Congress of the United States who apparently have decided that mass transit systems must be funded from the Highway Trust Fund and from *no other source*.

These facts, Reid said, "put the present highway crises in better perspective." An overpowering need remained for the money to continue flowing into highway projects. "Highway people would also not argue that a user tax is inviolate, *per se*." However, with user taxes earmarked for highway betterment, and those highways in "desperate need of the money," Reid told his readers "*there is no justification for creating an artificial surplus and their raiding it for other uses, however laudable*." Unfortunately, certain legislators had "determined that the Trust Fund must be raided, even to the point of spurning the required mass transit funds offered from the General Fund expenditures for urban roads!" This "highly irresponsible and illogical action" left the highway program in limbo until 1973, when the same claims for the "extra" money will be repeated:

> Now is the time for all good highway men and all other reasonable men and women who use outdated and deteriorating roads to do something about the unfortunately anti-highway attitude that exists in Congress.

Readers should attack the "surplus" concept by bombarding "your congressmen with pictures of outgrown streets in *his* district." Swamp him with traffic accident data "for the overtaxed roads in *his* district" compared with the safety record on newer roads. Show him the relationship between dollars spent and lives saved and remind him of how many more "could have been saved by the proper expenditure of these 'surplus' funds." And ask him "if he wants to be responsible for these deaths."

Reid concluded:

> You might as well face the hard truth, no one but highway people will do this important job. If the Trust Fund is to be saved you are going to have to do it.
>
> Do it now . . . tomorrow will be too late. [Reid, Frank, "Leave the Highway Trust Fund Alone: Its Job Is Not Yet Done," *Better Roads*, December 1972, p. 13, emphasis in the original]

Part 4
Finishing the Job

Aftermath of a Historic Landslide

Author and journalist Theodore J. White, writing in 1975, painted a pessimistic picture of Presidents who win by a landslide. They suffer, he said, from "the delusion of omnipotence." He illustrated with several examples:

> Roosevelt in 1936 (victory by a 60.8 percent, 11,000,000-vote landslide) went on nearly to wreck his second administration by his proposal to pack the Supreme Court. Lyndon Johnson (61 percent, 16,000,000-vote landslide) went on in 1964 to plunge the nation simultaneously into a social revolution, an unauthorized foreign war, and an inflation that still, in 1975, rages uncontained.

To this list White added President Nixon after he defeated Senator McGovern to win a second term as President. Nixon won the popular vote with an 18 million vote margin (or 60.7 percent of all votes), taking every State except Massachusetts and the District of Columbia to secure an electoral college victory of 520 votes to 17. [White, Theodore, *Breach of Faith: The Fall of Richard Nixon*, Atheneum Publishers/Reader's Digest Press, 1975, p. 169]

President Nixon's "coattails" did not significantly increase Republican membership in the Congress. In the Senate, Democrats gained two seats, bringing their total to 57. Republican Senator Allott of Colorado, the transit supporter, was defeated by Democrat Floyd D. Haskell, while the Democrat and future Vice President, Joseph R. "Joe" Biden, Jr., of Delaware, defeated Senator J. Caleb Boggs. In the House, Republicans gained 12 seats, but remained in the minority with 192 seats compared with 243 for the Democrats.

(On December 18, 1972, Senator-elect Biden's 30-year-old wife Neilia and 18-month-old daughter Naomi were killed in a crash on Route 7 in northern Delaware. Out to buy a Christmas tree, Neilia pulled out from a stop sign into an intersection and the family's station wagon was broadsided by a tractor-trailer. According to the police report, the station wagon continued "approximately 150 feet, spinning around, going backwards down an embankment, and striking three trees." Their two sons, 4-year-old Joseph ("Beau") and 3-year-old Robert, were seriously injured but fully recovered. Biden, in Washington interviewing potential staff members, flew back to Wilmington to tend to his sons at General Division Hospital.

(While taking care of his sons and recovering from the shock of his wife's fatal Christmas shopping trip, the Senator-elect considered resigning, but was persuaded to proceed. He took the oath of office at the hospital. To care for his sons, he began commuting daily between Wilmington and Washington on Amtrak, a practice he continued throughout his years in the Senate, where he became one of Amtrak's strongest supporters. [Associated Press, "Senator-Elect's Wife Dies in Auto Accident," December 19, 1972; United Press International, "Biden's Wife, Child Killed in Car Crash," December 18, 1972; Associated Press, "Biden Takes Oath Friday," January 2, 1972])

Like Presidents Roosevelt, Johnson, and other landslide winners, Nixon "was suffering from similar intoxication the morning after his 1972 election," but one that White described as "oddly sullen" rather than exuberant as had been the case with his predecessors. [White, p. 169]

Having won reelection, the President headed to Camp David in Maryland to plan the New American Revolution he had announced in the 1971 State of the Union Address but that had made little headway since. Speechwriter William Safire had coined the phrase to provide a unifying theme for the Administration – like the New Deal, New Frontier, and Great Society of past Democratic Administrations. Presidential historian Richard Reeves described the concept as "stringing together the same old programs and calling it a revolution." Nixon liked the phrase because it was colorful, in contrast with focusing on programs most voters never heard of or didn't understand. In the 1971 address, Nixon described what he had in mind:

> But above all, what this Congress can be remembered for is opening the way to a new American revolution—a peaceful revolution in which power was turned back to the people—in which government at all levels was refreshed and renewed and made truly responsive. This can be a revolution as profound, as far-reaching, as exciting as that first revolution almost 200 years ago—and it can mean that just 5 years from now America will enter its third century as a young nation new in spirit, with all the vigor and the freshness with which it began its first century.

The phrase had not caught the media's focus or the popular imagination, but having won reelection, the President wanted to accomplish the goal of his New American Revolution through executive actions, budget manipulation, and personnel purges, as Reeves described:

> He wanted to seize control of the government he believed was filled with time-serving incompetents and secret enemies. He was convinced that his orders were being ignored or subverted by bureaucrats in the State and Defense Departments, by Justice Department lawyers, by appointees at HEW, by the FBI and the IRS, by liberal numbers collectors in the Bureau of Labor Statistics.
>
> He intended to reorganize and reduce the size of the executive branch of the government and bring it under his own direct control.

By these moves the President would accomplish the goals of his 1971 government reorganization plan even if Congress had not approved the changes.

To accomplish this revolution, he wanted people around him who felt total loyalty to the President and would implement his policies without question. He would "personally choose general counsels, public affairs director and spokesmen, personnel directors, legislative liaisons, and the chief administrative executives of every agency." [Reeves, Richard, *President Nixon: Alone in the White House*, Simon and Schuster Paperbacks, 2007, p. 286 (Safire), 544 (reorganization)]

During a Cabinet meeting the day after the election, Chief of Staff H. R. Haldeman preceded the President into the room, asking the members to submit *pro forma* resignations for the President's consideration as he planned his new Administration. Then the President entered to a standing ovation from his Cabinet. White quoted an anonymous Cabinet member who said that the President's comments had "this joyless, brooding quality . . . you almost had the impression he had lost." He thanked his Cabinet and emphasized that he "wasn't about to go downhill," as many two-term Presidents had. The source added, "There was a vague reference about our submitting resignations, but it was so indirect." The President left the room, and Haldeman came back in to say, "I'm not entirely sure you people understood what the President said—when he said he wanted your resignations, *he meant he wanted your resignations*."

The anonymous source told White, "I was watching Volpe's expression and I could see Volpe was stunned. Volpe had knocked himself out in the campaign, talking two or three times a day for Nixon. He couldn't understand it. I couldn't."

What had happened was that the President was going to act on his longstanding plan to gain control of the Executive Branch as reflected in his 1971 reorganization plan:

> What was planned was surgery on the government of the United States, the extension of the concept of executive control of government by the elected President from that of tradition to an entirely new political theory—an attempted change in the nature of the Presidency, almost, but not quite, amounting to a Constitutional change.
>
> The President was about to streamline by fiat the entire Executive Branch of government, install within every department a personal agent of the White House staff to supervise it, create about himself a super-cabinet lodged in the Executive Office Building, officially remove traditional Cabinet members from access to him, and purge the bureaucracy until it became the unquestioning subordinate instrument of the White House policy center which he alone would direct.

Some members of the Cabinet left voluntarily while others were elevated to new positions. Some did not receive such treatment:

> But others were thrust out brutally—Volpe was given half an hour's notice to decide whether he would accept the ambassadorship to Italy or leave entirely. He accepted the embassy and, on inquiry later, learned that the Cabinet was being purged of people who "had a base of their own." [White, p. 171-176, emphasis in original]

Volpe recalled the event differently. He had scheduled a speech to a highway safety symposium in Mexico in mid-November. The President had wanted to meet with each Cabinet member, but told Volpe to keep his engagement and to visit Brazil, Venezuela, and Argentina to exchange transportation information. Returning to Washington, Volpe prepared an agenda outlining his plans for the second term:

> Before Volpe left for the White House, Ehrlichman called, asking to see him fifteen minutes before his appointment. Volpe stopped in at Ehrlichman's office, and the White House aide delivered the news. He was to be offered the post of ambassador to Italy.

> Volpe was surprised and angered at the breach of courtesy, but he hid his annoyance as he was ushered into the Oval Office. There the president congratulated him on his work at DOT and formally offered him the job in Italy.

Volpe had wanted the post, but not yet. He asked for 4 more months to see crucial legislation, including the highway reauthorization, through Congress, but the current Ambassador, Graham Martin, was being shifted to Vietnam, and Nixon did not want the post in Italy to be vacant for long:

> Volpe returned to his office at DOT and shut the door. [Aide Barry] Locke found him sitting, silent, with the agenda on his desk before him next to the model of the SST. "The president wants me to go to Rome," he said, simply.

His wife Jennie was excited about the new post, but Volpe was not sure. "John," she told the Transportation Secretary, "go back to the White House and say yes before he changes his mind!" According to Kilgore, Ehrlichman called the next day to inquire about Volpe's decision, but Volpe had not made up his mind yet. The same conversation took place the second day. On the third day, Volpe told Ehrlichman, "Yes. You can tell the president I will go to Rome." [Kilgore, p. 197-198]

Perhaps Volpe should have seen it coming. Despite references to the President's full support for Volpe's initiatives, the Secretary had rarely been able to speak to President Nixon about crucial transportation issues. Their conversation in March 1971 about the SST was one of their few substantive discussions. They also had spoken following Senate passage of the Airport and Airways Improvement Act in 1970, 88 to 4, but only after Volpe made strenuous efforts to get through aides trying to block the call. After Nixon and Volpe talked about the legislation and transportation for a few minutes, the President said, "John, you know you can talk to me anytime you want." The next time Volpe tried to speak to the President, his aides made it virtually impossible.

Kilgore said:

> Volpe had taken the president at his word that he would be available to his cabinet, but within a few months of the inauguration, it was difficult to get a call put through to the Oval Office. Within a year, for Volpe it had become nearly impossible.
>
> In the years Volpe served in the cabinet, Nixon called him only once at DOT, on a day Volpe happened to be speaking on the West Coast. A wall seemed to be forming around the White House, impenetrable to all but a few insiders . . . . Word spread among the upper levels of the administration that the only way to see the president was through two White House staffers: John Ehrlichman, a young Seattle lawyer, and his friend H.R. Haldeman, a California advertising executive. [Kilgore, p. 189-190]

By June 1970, according to Richard Reeves, Nixon had identified Volpe as one of the Secretaries he wanted to get rid of, along with former Alaska Governor Walter J. Hickel (Secretary of the Interior) and former Michigan Governor George W. Romney (Secretary of Housing and Urban

Development). Reeves said of Hickel that he fell out of favor with the President "because like most former governors, Walter Hickel among them, he was used to being listened to and used to making his own decisions." Volpe, apparently, suffered from the same problem as far as the President was concerned. [Reeves, p. 231] (Hickel's downfall came soon after he criticized the President's policy in Vietnam; he departed his post on November 25, 1970. Secretary Romney survived to be replaced, like Volpe, after the 1972 election.)

In a retrospective article, former Under Secretary Beggs and former Assistant Secretary for Administration Alan L. Dean discussed the tensions that had existed between the White House and Secretary Volpe:

> Volpe was required by law to develop a transportation policy and submit it to Congress. The secretary, Under Secretary, and Paul Cherrington [Assistant Secretary for Policy and International Affairs] soon learned that the Nixon White House had its own ideas concerning the content of the report. What it eventually transmitted to congress fell far short of what the department had sought to do. This generated frictions between an energetic and imaginative secretary and a Nixon White House which became increasingly inclined to micromanage the executive departments. Frustrated in his effort to present a national transportation policy of the scope which he believed the country needed, the secretary turned to legislation as a principal means of addressing established needs and asserting the role of the department contemplated by the Department of Transportation Act . . . .
>
> In summary, no other executive department was as successful as DOT during President Nixon's first term in developing and securing the enactment of major statutes relating to its mission and programs. Unfortunately, Secretary Volpe and his principal policy advisor, Paul Cherrington, found that the Nixon White House gave the department little credit for these accomplishments. Volpe and Cherrington resisted White House efforts to revise DOT's legislative proposals in ways they regarded as harmful. White House aides increasingly viewed Volpe as aggressive and bothersome and not sufficiently responsive to their efforts to modify the department's recommendations. These frictions eventually culminated in President Nixon's 1971 recommendation to Congress that the Department of Transportation be abolished as a part of a general reorganization of the domestic executive departments.

Beggs and Dean summed up Volpe's 4 years:

> By the end of Nixon's first term the department had earned a reputation for competent management and had shown skill in developing and securing the enactment of urgently needed transportation legislation. The department also generally [succeeded] in securing the funds needed for strengthening old programs and implementing new ones.

There was one problem:

> As previously noted its very impressive accomplishments received little recognition from the Nixon White House. The effort to abolish the department got nowhere, and the only effect of this proposal was to make it more difficult to explain and defend the president's departmental reorganization program. [Dean, Alan L., and Beggs, James M., "The Department of Transportation Comes of Age: The Nixon Years," *Presidential Studies Quarterly*, Winter 1996, p. 209-215]

(One of the odder contacts between Secretary Volpe and the President occurred in May 1970. Demonstrating students had occupied public places, including the Lincoln Memorial, to protest the Vietnam War and its extension into Cambodia. They also were incensed because on May 4, National Guardsmen had fired into a crowd of protestors at Kent State University in Ohio, killing four students and wounding nine. On May 8, the President addressed the Nation on television, then began a restless series of telephone calls to friends and associates, beginning with National Security Advisory Henry Kissinger, presidential secretary Rose Mary Woods, his daughter Tricia, and Secretary of State William Rogers. In 3 hours, he made nearly 40 more calls, including one at 10:56 p.m. to Secretary Volpe. The brief call ended by 10:59, when the President called Representative L. H. Fountain (D-NH).

(Following the calls and a few hours of sleep, he took his limousine to the Lincoln Memorial where he had what White described as "a warm and pleading conversation on peace, foreign affairs and environment with the students encamped there." Next, he visited the Capitol before ending his overnight experience at the Mayflower Hotel for breakfast with Haldeman and others. "Whether or not Richard Nixon came close to nervous breakdown in the events of May, 1970, is debated seriously by his aides." [White, p. 131-132, Safire, William, *Before the Fall: An Inside View of the Pre-Watergate White House*, Doubleday and Company, 1975, p. 204])

Press secretary Ronald L. Ziegler announced Volpe's `selection as Ambassador to Italy on December 7, 1972. Volpe released a statement summarizing his accomplishments:

> I have tried in the past four years, with direction and encouragement from President Nixon, to focus all of our Nation's great and diverse transportation interests on the central task of building a better, more effective mobility for America.
>
> We have made a strong beginning. Public transportation is beginning to blossom again in cities and communities across the country. Our highways are a bit safer; our automobiles are safer. The passenger trains are running, more travelers are beginning to use them, and regular patrons are finding them cleaner and more efficiently run. Automation of the airways has been accelerated, and flight delays have been reduced.
>
> We have seen the enactment of meaningful, long-term legislation by a Congress sympathetic and responsive to transportation needs. We have made the first technical and regulatory assaults on transportation-caused air and noise pollution.
>
> And we have tried on every hand to put our country's critical urban transportation requirements into word and into action.

> But whatever we have achieved to make the wheels of transportation progress turn faster and more effectively for more people, I take greater satisfaction in what we have been able to do to make transportation contribute to a better environment, to help the minorities among us gain full and equal opportunity to the realization of the American dream, and to lessen the risks of death and injury in every transportation mode.

Some goals remained unaccomplished:

> For example, we have not yet been able to utilize the full flexibility of the highway trust fund to enable our cities to meet their urban transportation needs, afford the highway user all the value to which he is entitled, and provide real solutions to the total transportation problems.

That was the only unrealized goal he cited in the statement.

Secretary Volpe held a news conference on December 19 in Washington. His 4 years, he said, had been "constructive ones for transportation and the environment." After citing progress against airplane hijackers, he turned to "President Nixon's program of assistance for public transportation," including more than $2 billion in Federal mass transit funds since early 1969, the opening of BART, and the appearance in 1972 of "rather convincing proof of the effect exclusive busways can have on the travel habits of suburban commuters." On Shirley Highway in northern Virginia, he said, bus ridership was up 230 percent (30,000 commuters).

Progress on the Interstate System had continued (now more than 80 percent complete) along with improvement of the primary and secondary roads and highway safety. One disappointment remained:

> We worked very hard this year to make funds from the Highway Trust Fund available for urban transportation projects, including public transit if communities so desire. I confess I leave my post as Secretary with some sense of disappointment that the Administration's position on this important issue did not prevail in the last Congress. But I am confident that my successor will persevere in this cause, and that a proposed amendment to the Federal Highway Act will be foremost on our legislative agenda when the 93rd Congress convenes. As I have pointed out before, the language of the 1956 Highway Act specifically states that the trust fund will be "for the benefit of the user" – and I can think of no better way to get more mileage out of every highway dollar than to relieve the congestion on our urban roadways.

Claude S. Brinegar

His successor, press secretary Ziegler announced, would be Claude S. Brinegar, a 45-year old senior vice president of Los Angeles-based Union Oil Company. (His name rhymed with vinegar, as articles about him often pointed out.) He had never served in government but was "a very capable manager," Ziegler told the press. The President had never met Brinegar prior to their interview about the position, and he had contributed only $50 to the reelection campaign. ["Charlton, Linda, "Oilman Will Get Transportation Post," *The New York Times*, December 8, 1972]

According to a news account, colleagues described Brinegar as a "precise, able administrator who doesn't waste words and is an expert at statistics." He was the "type of administrator who must find things out for himself." One colleague said, "With most people, you can give them a mathematical equation and they'll use it, but Claude's got to derive the equation before he'll use it." An engineering colleague said, "He's considered one of the extremely good statisticians. He handles statistical analysis better than anyone I've ever run into. He also handles every problem from the standpoint of logic . . . and he's a very thorough grammarian."

Brinegar had limited experience with transportation, and that was mostly as a consumer:

> Brinegar's experience in transportation appears limited to what he has experienced at Union Oil—and that's mostly pipelines. He told a Los Angeles news conference yesterday that he has gained an extensive familiarity with transportation problems because he has flown one million air miles. He also pointed out he is a daily commuter on crowded Los Angeles freeways.

Another transportation link was his service on the Board of Directors of International Speedway Corporation, which operated stock car tracks in Daytona Beach, Florida, and Talladega, Alabama. His service on the board was not because he was a car buff, but because Union Oil owned 25 percent of the firm and was the official fuel supplier for the National Association for Stock Car Racing. [Aug, Stephen M., "Brinegar Known for Management," *Washington Star-News*, December 8, 1972]

The announcement of Brinegar's appointment prompted immediate opposition. The Highway Action Coalition said it was "outraged" by the nomination since Union Oil had been involved with the Santa Barbara oil spill and other pollution incidents. (On January 29, 1969, a Union Oil Company platform 6 miles off the coast of Santa Barbara, California, experienced a blowout that lasted 11 days and unleashed oil and natural gas. Crude oil created an 800-square mile oil slick that flowed onto 35 miles of coastline. Hundreds of birds, clams, dolphin, fish, lobsters, and other sea creatures became trapped in the oil slick and died. This incident was instrumental in creating public and congressional awareness of the need for Federal environmental oversight, which turned into the National Environmental Policy Act of 1969. See "Addressing the Quiet Crisis" at http://www.fhwa.dot.gov/highwayhistory/nepa/index.cfm.)

The coalition also was upset that Union Oil had contributed $20,000 in 1968 to a group that worked against a voter proposition that would have allowed 25 percent of California's highway user tax revenue to be used for mass transit and anti-pollution activities. The company also had contributed $10,000 in 1970 to defeat referenda that would have protected the California coastline, in one case by blocking off-shore drilling. John Kramer said the appointment "represents the payment of a political debt that would have been better left unpaid." As far as he was concerned, what was "probably the worst environmental disaster in California's history" rendered Brinegar unsuitable to be Secretary of Transportation.

Brinegar, asked at his introductory press conference about the $20,000 contribution, said he was living in Chicago at the time and was not aware of it. He said of himself:

> Although I have spent most of my business career with Union Oil, I by no means consider myself an oilman, whatever that term means. I think of myself as a professional manager.

He would have "no problem" working with environmentalists and added that sound, business-like analysis of the impact of commercial development "clearly needs to be done."

As for diversion of Highway Trust Fund revenue to transit, he considered the criticism of him unfair since he had never taken a position on the matter and had not played any role, pro or con, in his company's work with road lobbyists to prevent a shift. He had committed to the President to follow the Administration's positions, including support for diversion. [Charlton and Aug, and Holles, Everett R., "Nixon Appointee Shuns Label of Oilman," *The New York Times*, December 24, 1972]

As part of the effort to gain control of the agencies, the President selected Egil Krogh, 33 years old, to oversee the Department of Transportation. He would replace Beggs as Under Secretary, having most recently worked under the President's domestic chief, John Ehrlichman. ["2 Nixon Aides Get Sub-Cabinet Jobs," Associated Press, *The Washington Post*, December 10, 1972]

The Washington Post endorsed Brinegar for Secretary, noting that "this is no time . . . to be leaping to premature assessments of how or what he will do." The same sort of "weeping and wailing" that had greeted his selection had greeted the selection of Governor Volpe, a well-known road advocate:

> But as things turned out Volpe was the key figure in the administration's drive to tap the highway trust funds for public transit dollars. And it is noteworthy that White House Press Secretary Ron Ziegler took special pains the other day to emphasize that Brinegar is totally committed to the administration's goal of achieving greater flexibility in the controversial highway fund's use.

The editorial also endorsed Krogh based on his experience as the White House liaison on District of Columbia affairs. He had been involved in the long-running highway-transit controversy in the city:

> The experience he gained in that crucible won't hurt a bit in tackling national transportation problems, and the new assignment assuredly increases the chances of resolving Washington's own road-rail hassle. ["Oil and Brinegar," *The Washington Post*, December 14, 1972]

The Senate Committee on Commerce, headed by Senator Magnuson, held its confirmation hearing for Secretary-designate Brinegar on January 9 and 10, 1973. After a brief summary of his background, he concluded that "those who have worked with me know that I value honesty, integrity, objectivity, and hard work very highly, and I plan to bring these standards with me as I tackle this new assignment." [*Nominations—January 1973*, Committee on Commerce, United States Senate, 93rd Congress, 1st Session, Serial No. 93-5, p. 4]

After Brinegar's brief statement, Chairman Magnuson introduced John Kramer to testify on behalf of Theodore Kheel for the Highway Action Coalition. Kramer summarized the coalition's initial objections to Brinegar, then said:

> In general, we felt that Union Oil . . . had at best a questionable environmental record and that a man who had spent most of his adult life in high executive positions for that company . . . might not—I emphasize "might not"—be well suited for one of the most environmentally sensitive posts in the administration.

Nevertheless, the coalition had moderated its stance since his nomination:

> On the other hand, environmentalists and others had expressed similar doubts about the appointment of Secretary John Volpe 4 years ago. We proved to be wrong.
>
> We established a very close and mutually productive working relationship, and he proved to be an essentially able and energetic advocate of transportation reform.
>
> Needless to say, we at the Coalition, would like nothing better than to be similarly proved wrong in Dr. Brinegar's case. Similarly we would like nothing better than to continue our close relationship with the Department of Transportation in behalf of new transportation priorities.

Before deciding whether to support Brinegar, however, the coalition wanted to know his position on three issues: "(a) on opening up the Highway Trust Fund; changing the direction of national transportation spending priorities; (b) his views on various environmental safeguards that have been written into highway law, and various other important pieces of legislation; and (c) his views on the proper role of the citizens in the transportation planning process. [*Nominations—January 1973*, p. 5-6]

(Kheel's formal statement, reprinted in the hearing record, reiterated these points in greater detail. [p. 6-9])

Senator Hart of Michigan asked Brinegar to address the three issues Kramer had raised. First, Brinegar wanted to respond to other points in Kramer's presentation, beginning with the implication that "I am unqualified because of my business association." As for Union Oil being responsible for the Santa Barbara oil spill, Brinegar pointed out that four companies were operating that lease and they had contracted a drilling company to operate the off-shore well that led to the catastrophe. "In any case, the four companies cleaned it up and the beaches are now, today, better than ever."

Brinegar also pointed out that he was in Chicago when proposition 18, the measure to divert some highway user tax revenue to transit, was on the ballot in 1970. He added that after he moved to

California, Union Oil supported a legislative proposal that became law to impose a 5 percent sales tax on gasoline to support many of the same things.

Turning to Kramer's three issues, Brinegar said, "I support the administration's position of a flexible approach to the use of transportation funds." He wanted to study the issues more closely before getting into specifics, but said "the time has come to look more broadly at the Nation's transportation needs, and I plan to do that."

On the second point, Brinegar said, "I consider myself an environmentalist in the sense that I feel very strongly about the environment." He said of Secretary Volpe that he had, "I am told, a very fine record and I certainly intend to see that this approach is continued and expanded if need be."

He had no suggestions for citizen participation in transportation planning, but "would welcome their contributions and suggestions." (This response suggests he did not understand the question or the role of the public in transportation planning.)

Senator Hart said he understood the response to mean "you might well consider using some of that money for purposes other than the highway construction." This diversion had been proposed, Brinegar replied, and "the time has come to consider other uses." He wanted to explore the issue before making a commitment. [*Nominations—January 1973*, p. 9-10]

Senator Cannon mentioned that OMB had vetoed or quashed policies and programs dealing with national transportation programs. He wanted to know if Brinegar would be independent and "vigorously support and fight for the DOT programs when they are reviewed by OMB and the White House staff, or is your role simply to take orders from them, much as Secretary Volpe did in responding to the antihijacking problem?" Brinegar stated that his job, if confirmed, was "to vigorously fight for that which I believe the Department should be doing." He was not leaving his job at Union Oil "to take orders from somebody that isn't involved in my affairs." [*Nominations—January 1973*, p. 15]

The committee had invited Senator Randolph, whose Public Works Committee shared jurisdiction, to join the panel in questioning the Secretary-designate. His first question was whether Brinegar favored a single trust fund for all transportation modes or a third trust fund for mass transit. Brinegar replied that he had only begun to focus on such issues and had not yet "reached a point where I can give my position."

Randolph pointed out that the Administration had suggested reducing authorizations for the Interstate System. Did Brinegar believe the Interstate System should be further delayed? The Interstate System, Brinegar replied, "has been of enormous importance to the country," but he wanted "to see what the priorities are and what the programs are" before responding specifically.

In response to Randolph's inquiry about continuing the safety proposals included in the 1972 highway bill, Brinegar said he shared the concern about highway safety, but "the mechanics and funding to reach our objectives are things I really can't speak to" until he had reviewed what is proposed.

In a written response to these questions, Brinegar indicated that the Administration's legislative proposal would address safety and completion of the Interstate System. With 80 percent of the Interstate System open, "it is necessary to begin giving more weight to other transportation systems which had received a lower priority" during peak Interstate construction years. The legislative proposal would provide sufficient funds "to have the Interstate system fully authorized by 1980, our present completion target."

Before the hearing adjourned until the following day, Senator Randolph was given the opportunity to address one other issue: impoundment. He explained the congressional efforts to do something, including two "sense of the Senate" provisions, "but this has been meaningless from the standpoint of a response by the Executive to what the Congress feels." He cited the court cases working their way through the judicial system. He asked Brinegar whether Congress could anticipate additional withholding of funds.

The Secretary-designate did not have a position on the issue, but later submitted a formal statement on impoundment of highway funds. It stated that in 1972, Secretary Volpe had promised that if Congress approved the Single Urban Fund, it would be funded at authorized levels. Because Congress had not done so, the Administration was not bound by that promise. For the future, the key was that Federal-aid highway funds remained available beyond their year of authorization:

> Under certain circumstances, it is important to defer some transportation programs in the interest of the economic well being of the Nation and in order to make a more optimal use of Federal financial resources . . . . We believe that it is of paramount importance at this point to control inflation and avoid tax increases. We believe this must be done even though it means some deferral of our transportation programs.

Finally, Senator Randolph asked if Brinegar, as a former oil company executive, had any difficulty accepting the position of the administration that Highway Trust Fund revenues should be used for urban mass transit facilities. Brinegar replied that he had no difficulty with the general proposition; the time had come for more flexibility. He planned to "get into it very hard," in coming months, but "I do support the administration's general idea of flexibility."

In view of that statement, Randolph asked "could we say or would you wish to say that all trust funds should be available to mass transit, or those highway trust funds allocated to urban areas?" Brinegar replied, "I can't say that." [*Nominations—January 1973*, p. 17-22]

The committee resumed the hearing on January 10. Questions concerned the highway beautification program, the Alaska Railroad, the concept of an Interstate highway in Alaska, negotiations with Canada on improving the Alaska Highway, and a possible demonstration program for high-speed transportation linking the Washington area's two airports with the railroad hub at Union Station.

Senator Hartke was concerned about a report that on December 14, 1972, Secretary Volpe and other DOT officials met with representatives of motor carriers and transportation labor to discuss a legislative proposal–without inviting the Interstate Commerce Commission (I.C.C.) or Members of

Congress. “Do you feel that is the proper way to develop a legislative proposal?” Brinegar was not aware of the meeting, but said he would like to hear from all interested parties “very early.”

Hartke replied, “I am not asking about all interested parties. I am asking about the Congress.” He was clearly frustrated that Brinegar would not commit beyond saying, “I will certainly use Congress as a consultant” without indicating whether he meant in early deliberations or a later stage and in what venue. [*Nominations—January 1973*, p. 33-35]

Senator Howard Baker asked about completion of the Interstate System. In view of the failure of Congress to pass legislation in 1972, he asked if as Secretary he would support a stand-alone resolution to permit apportionment of Interstate construction for a 3-year period. Brinegar submitted a response for the record. It came after he had been sworn in and was testifying before the Senate Public Works Committee, during which he endorsed the idea of a resolution. Beyond that, he said the Administration was committed to early completion of the Interstate System. [*Nominations—January 1973*, p. 30-31]

At one point in the questioning, Senator Weicker asked “exactly what it is in your background that would qualify you for a position as a transportation advisor to the President?” Brinegar cited his management experience and his work with a variety of groups, technologies, and policies:

> When the President asked me, I reflected a bit on whether I was qualified. I looked into the Department, and inquired of myself, what could I bring to it? I found issues that were very important to the Nation that I could work on, and I concluded that I was fully competent to work on them. Yes sir; I think I have the ability.

Senator Weicker pointed out that he did not question his academic or management background. “But,” he said, “I have yet to hear one single response to a question relative to transportation, Mr. Brinegar, where there has been any sort of specific answer.” Brinegar acknowledged that he could not “speak technically of whether or not I could design an airplane, build a road, or run a railroad.” However, “I am not sure if this type of knowledge is essential for one coming into this office.” He expected to work with advisors who had the necessary expertise.

The Senator asked if Brinegar was familiar with the Cooper-Muskie amendment that had passed the Senate by a vote of 48 to 26. “Not specifically,” Brinegar replied. He had read about it “very briefly” and knew it permitted the use of Highway Trust Fund revenue for mass transit. Weicker explained that “nothing in transportation has come to the fore with greater clarity, or faster, than the entire issue of balancing our transportation systems, and utilizing funds for all forms of transportation.” He asked, “You do not find it strange that nobody in the administration mentioned this, during the course of interviews or talking with you or in the course of accepting this position?”

> Mr. Brinegar. I was asked to contribute if I could, to shaping a balanced transportation system. I was asked what my position was on the use of highway funds. As I indicated, I believe the time has come for a flexible approach.
> Senator Weicker. What does that mean—what is a flexible approach?
> Mr. Brinegar. In my opinion it means that the inflexibility of the past has to be changed.

> Senator Weicker. In other words, the highway trust fund being used solely for highways should be changed, is that correct?
> Mr. Brinegar. Yes, sir.
> Senator Weicker. Do you feel there is a similar commitment on the part of the administration, now, to utilization of highway trust funds for mass transit, as was the case in 1972?
> Mr. Brinegar. I have not inquired of the administration, sir, about its present commitment.
> Senator Weicker. And they have not raised it with you?
> Mr. Brinegar. No, sir.
> Senator Weicker. I thought you indicated to my previous question that the question of flexibility and use of these moneys had been discussed with you, Mr. Brinegar?
> Mr. Brinegar. We talked in a broad sense, in terms of how I view the matter. I indicated I obviously had a lot to catch up on with respect to the details of how the position evolved. I have not looked at the legislative proposals, at all. I was asked to come in and develop and help shape overall programs and focus on the priorities. I have not gotten into specifics, sir.

Senator Weicker pointed out that Secretary Volpe had "carried the ball for transportation" despite not having "the wholehearted—'enthusiasm,' I believe would be a better word than 'support'—enthusiasm of the administration." Secretary Volpe "had to do the job" because "if he did not do the job, nobody was going to do it." The Senator wanted to know if "there is going to be similar enthusiasm on your part" to "carry the ball." Was Brinegar "aware of anything in the way of facts that have occurred within the past several months to weaken that resolve and enthusiasm when the issue comes before the Congress again in the early part of the session?" Brinegar replied that he had not gone into the details of what happened in 1972.

Senator Weicker then raised an unexpected subject about whether the Administration's enthusiasm for diversion of Highway Trust Fund revenues to mass transit had been weakened by "anything in the way of facts that have occurred within the past several months":

> Would you say a contribution of $186,000 from the trucking industry to the President for his reelection campaign might cause such a weakening of the resolve to open up the highway trust fund for mass transit?

Brinegar said, "I have no way of answering that" and was not aware of the trucking industry's contributions to the reelection campaign. [*Nominations—January 1973*, p. 48-50]

Later, outside the hearing room, Senator Weicker talked to reporters about his allegation that the trucking industry's campaign contribution had cooled the Administration's support for diversion of Highway Trust Fund revenue to mass transit. "There's been a clear shift. It's a fact, the administration has switched. We've gone from red hot to luke warm." He added that transportation "is not a hot issue at the White House, anyway." That was one of the reasons why he was concerned about Brinegar's vague responses. They suggested to Weicker that the White House would control the Department's agenda through Krogh. [Winters, Bruce, "Nixon Road-Fund Shift Laid to Donation," *The Baltimore Sun*, January 11, 1973]

During the hearing, Senator Weicker asked Brinegar if he had discussed the future of the Highway Trust Fund with Secretary Volpe. Brinegar said he had told Secretary Volpe "that I think we need a more flexible view" and was looking forward to detailed briefings on the topic.

How many times had the Secretary-designate met with the President? They had met only once at Camp David for about an hour. Weicker asked if the President had given any indication of transportation policy. "No," Brinegar replied. "We talked generally about the transportation issues around the country. Also, we talked about my role but, the President's remarks would have to come from him."

After a lengthy discussion of Amtrak, Senator Weicker pointed out that Mobil Oil Company and Atlantic Richfield Oil Company had departed "the highway trust fund lobby" and favored diversion of revenue to transit. He asked if Brinegar knew whether Union Oil would take a similar position. Brinegar indicated, "I can't speak for the company's official position. I am not the chief executive."

The Senator also asked about Secretary Volpe's statement in early 1970 "that the Department of Transportation was drafting preliminary ideas for a national transportation trust fund." He asked Brinegar if he could "give us any idea of the status of these plans?" Brinegar replied, "I can't." He had not studied the issue and could not say whether he supported the concept. Did Brinegar favor "one transportation trust fund or would you favor several transportation trust funds?" He had not been close enough to the issue to have a position. [*Nominations—January 1973*, p. 53-54]

Senator Tunney, who as the Senator from California had formally introduced Brinegar to the committee, asked Brinegar to confirm that Union Oil's position on Proposition 18 would not influence his judgment on Highway Trust Fund diversion. "No, sir," he replied. "What went on will in no way influence my approach to this issue."

Concerning project delays for environmental review, Senator Tunney asked, "Would you stop or abandon these reviews." Brinegar favored "full study of the environmental issues." Would DOT change the environmental review process? Brinegar did not know "what the process is, so I obviously can't speak to it." Did he believe Federal law should exempt specific projects from environmental review? Although it would be "hard to make a broad generality," he would want to look at "the rationale behind exemptions and exceptions."

The Senator asked if "not building a highway is an alternative which must be considered by the Federal Highway Administration even though the alternative may not be within the jurisdiction of that bureau and I am thinking specifically where a NEPA evaluation may suggest that a proposed highway or highway system is environmentally unacceptable." Brinegar replied that he certainly did "and one of the things that I hope to do is to concentrate more on an interrelated intermodal approach as we look at these alternatives." [*Nominations—January 1973*, p. 56-57, 60]

Senator Tunney's questions concluded the hearing.

The Los Angeles Times expressed concerns about Brinegar in an editorial after the confirmation hearing. Brinegar, the editor said, "had little to say" and had "declined to give his views on a number of important transportation issues, chief among them the use of federal highway trust funds to support urban mass transit." His silence "may only have been a matter of prudence" but given the fight over the Highway Trust Fund, it "is also somewhat disturbing." Noting that the Cooper-Muskie amendment had passed the Senate with full support from Secretary Volpe, the editorial explained that the failure in the House "under great pressure from the highway lobby."

Diversion of even a small amount of funds to rail as envisioned in the amendment "is now more than ever a matter of urban necessity." Given the differences between the Senate and House, "it is particularly important for the Administration to put its weight solidly behind the effort." The editorial considered diversion "a fair and feasible approach" and hoped that Brinegar would "familiarize himself with the issue quickly, and that he will give it the degree of commitment it deserves." ["Brinegar's Silence on Urban Transit," *The Los Angeles Times*, January 12, 1973]

During Under Secretary-designate Krogh's confirmation hearing on January 11, the Senate Commerce Committee explored his involvement in Watergate-related issues at length. Krogh, an attorney who had served as Deputy Assistant to the President for Domestic Affairs since November 1969, acknowledged that he had helped set up the "plumbers" unit to investigate leaks in mid-1971, but denied any further ties to the unit after December 1971, long before plans to bug the Democratic National Committee's offices in the Watergate complex were developed. The committee accepted his responses.

Transportation issues covered a wide spectrum before turning, near the end, to the Highway Trust Fund. Chairman Magnuson asked, "Do you have any advice on the tapping of the highway trust fund?" Krogh replied:

> I support the concept of opening the highway trust fund for more flexible use by local governments. I support the initiatives that were introduced into the Congress in the last session.

Senator Weicker commented that he appreciated Krogh's response. "It is the most definitive response on that subject that we have had in the last 72 hours." [*Nominations—January 1973*, p. 88-89]

On January 19, 1973, in one of Secretary Volpe's final actions, he announced that he had rejected the proposed 3.7-mile section of I-40 through Overton Park in Memphis. He cited a recent Supreme Court decision and congressional actions. He had approved the routing through the park in November 1969, but the Supreme Court had ruled in March 1971 "that a lower court decision finding my approval in compliance with Section 4(f) of the Department of Transportation Act of 1966 was not substantiated by the record before the lower court." In January 1972, the U.S. District Court had directed the Department to make a new determination in view of the Supreme Court's decision.

Secretary Volpe noted several circumstances that had changed since his initial determination, including enactment of NEPA on January 1, 1970. He also cited new requirements included in the Federal-Aid Highway Act of 1970 for consideration of environmental effects, as well as the Supreme Court's ruling that "protection of parkland was to be given importance" under Section 4(f) and that "public parks were not to be lost unless there were truly unusual factors present" or "the cost of community disruption resulting from alternative routes reached extraordinary magnitudes." Based on these considerations, "I find that an Interstate highway as proposed by the State through Overton Park cannot be approved." He suggested several alternatives for I-40, including the use of the I-240 circumferential to carry I-40 traffic, the alternative eventually selected.

Immediate reaction to this decision in the long-running controversy was mixed. Mayor Wyatt Chandler saw the decision as a setback to the "90 percent of the people of Memphis" who supported the routing through the park, which had been redesigned repeatedly to satisfy "just about anybody of sound mind." In the absence of Federal-aid funding, the Mayor indicated he would seek State funding for the expressway. "It's the only feasible route." State Highway Commissioner Robert Smith agreed that, "We'll have to do something" because the "connecting ends are ready and there's nothing in between."

Kramer of the Highway Action Coalition said, "This shows at least that we need not accept the concrete cloverleaf as the national flower." John Vardaman, the Washington attorney who represented Citizens to Preserve Overton Park, emphasized how in the pre-NEPA era, individual citizens had taken on the highway builders. He attributed the victory to Mrs. Anona Stoner, now in her 70's, who had organized the neighborhood to defend against the expressway. "Without her," Vardaman said, "the highway would now be built." [Braestrup, Peter, "Volpe Bars Subsidies to Build Expressway in Memphis Park," *The Washington Post*, January 20, 1973]

Brinegar and Krogh received Senate confirmation by voice vote, without debate, on January 18, 1973. On February 2, they took part in a mass swearing in ceremony at the White House, along with 18 other Cabinet and sub-Cabinet positions. Chief Justice Warren E. Burger of the Supreme Court administered the oath of office, collectively, to the 19 men and 1 woman (Counselor to the President Anne L. Armstrong).

The Super-Secretaries

In January 1971, President Nixon had proposed a reorganization of the Cabinet to create four super-Departments based on the fundamental purposes of government: Human Resources, Community Development, Natural Resources, and Economic Affairs. The Federal-aid highway and transit programs would be shifted to the Department of Community Development. The President demonstrated the importance of this proposal by making a rare appearance in the White House Press Room to talk about the plan and by inviting Representative Chet Holifield (D-Ca.), Chairman of the House Committee on Government Operations, to fly with him to California on Air Force One. The trip gave Nixon an opportunity to lobby the chairman, whose initial public reaction had been negative, on the reorganization.

The President reiterated his request in March 1972, but Congress did not act on the overall reorganization plan. In May 1972, Holifield's House Government Operations Committee approved the Department of Community Development, 26 to 8. The House Rules Committee, which would have to schedule the bill for a floor vote, held it up.

Although Nixon promoted the Department of Community Development through the summer and the campaign, the House bill had little chance of proceeding, as Professor Mordecai Lee explained:

> There was no substantial political or policy constituency on Capitol Hill or in public opinion for such bills. Politics usually trumps policy in Washington, but in this case there was not much to trump. House leaders . . . never sent the DCD bill to the House floor for a vote in 1972. [Lee, Mordecai, *Nixon's Super-Secretaries: The Last Grand Presidential Reorganization Effort*, Texas A&M University Press, 2010, p. 2-3]

In the wake of his landslide reelection victory, however, President Nixon was even more determined to reorganize and gain control over the vast bureaucracy.

Professor Lee was a young scholar in late 1972 when he moved to Washington to research his dissertation in public administration on efforts to limit public relations in Federal Agencies. While examining files at OMB on his topic, the visiting scholar was given access to files on one of President Nixon's boldest administrative initiatives.

On January 5, 1973, the President announced an administrative reorganization that would accomplish the reorganization that Congress had rejected. He appointed three Secretaries to serve simultaneously as "counsellors to the president" for human resources, community development, and natural resources ("counsellor" was spelled with a double L). They would oversee all Federal activities under their jurisdiction across the lines of Departmental organization charts. They would report to one of the President's advisors, rather than to the President. Each would have his traditional office in Department headquarters, but also a counsellor's office in the Old Executive Office Building adjacent to the White House. As Lee wrote, "The media immediately dubbed these officials 'super-secretaries.'" [Lee, p. xi]

Under the plan, many elements of the Department of Transportation, including the Federal-aid highway and transit programs, would be overseen by counsellor James Lynn, the Under Secretary of Commerce who was nominated to be Secretary of the Department of Housing and Urban Development. Secretary of Agriculture Earl Butz would be the counsellor for Natural Resources, which covered the Council on Environmental Quality and EPA along with many other programs and activities. The counsellor for Human Resources was Caspar Weinberger, the former OMB director who became Secretary of Health, Education, and Welfare on February 12, 1973. The three counsellors reported to Ehrlichman, the President's Assistant for Domestic Affairs.

Lee explained the rationale for the changes:

> Nixon perceived the federal government to be a thick and virtually impermeable machinery geared to liberal values, increased domestic spending, and an ever-expanding role for the

> federal government in American society. From his perspective, the bureaucracy and its allies in Congress were indeed the enemy, and in many ways his assessment was accurate.

Civil servants were immune to political pressure since their tenure was not responsive to changes in political leadership. Expansion of Federal activities beginning with the New Deal in the 1930s had created multiple agencies that had become part of an "iron triangle of congressional committee, special interest groups, and agencies [that had] created a powerful and virtually impenetrable network of political power." Nixon wanted to find a way "to break the back of the bureaucracy." [Lee, p. 4]

Beyond the administrative reasons for the reorganization were Nixon's personal preferences. He was primarily interested in foreign affairs and had little interest in domestic policy. (Secretary Volpe's difficulty in meeting or talking with the President reflected this preference.) The reorganization of the domestic departments, with Ehrlichman as go-between, would minimize the time the President had to spend on domestic affairs. Nixon also "intensely disliked confrontations or any in-person tensions, even though he often talked about being tough and that he was cool in heated situations." Such situations could be minimized if he had little involvement in domestic issues that did not interest him. [Lee, p. 79 (confrontation) and 87 (foreign affairs)]

Even before announcing the reorganization plans for the second term, Nixon had taken steps to give the White House greater control over the Cabinet Secretaries. Haldeman and Ehrlichman had prepared a 10-item list that all appointees would have to accept. Some of the items were:

> It is the President's policy that insofar as possible all interdepartmental and inter agency issues should be resolved by the Counsellors and not the White House . . .
> A Cabinet Secretary should not be encouraged to anticipate either free access or frequent consultation with the President. Rather, his views will be transmitted to the President either in writing or via a principal secretary [i.e., counsellor] or Assistant [to the president] depending on the nature of the matter.
> Cabinet secretaries will be requested to delegate to Counsellors substantial authority concerning the operation of their departments. This delegation will be express and precise and, in each case, will be made in advance . . . .
> Cabinet meetings will be rare. Cabinet officers will be expected to act in concert with their colleagues in policy groups and policy councils [the latter chaired by counsellors] . . . .
> The Secretary agrees to submit to the appropriate Counsellor all Congressional testimony and public statements for clearance prior to release.

Another section stated that Under Secretaries and Deputy Secretaries would "play increasingly important roles." These would be former White Houses aides who would be more likely to implement Nixon Administration plans than Cabinet Secretaries who usually came from the private sector. The Secretaries were "expected to vest in their Number Two men broad capacity to operate and manage the Department." [Lee, p. 35-36]

In announcing the "super-secretary" plan on January 5, the Administration made clear that it also would continue pursuing legislation to implement the original reorganization plan. In the meantime, the administrative change would give the President the structure he needed. Despite the stated claim the legislation would be pursued, one goal of the counsellor initiative was to marginalize Congress while strengthening White House authority:

> Besides implementing an administrative (rather than legislative) reorganization through the counselors, this political effort included impounding appropriated funds that fit the president's agenda, moving to implement manpower revenue sharing administratively, and vetoing spending bills that went beyond what Nixon wanted. [Lee, p. 198]

The attempt to marginalize Congress reflected a contempt that was reflected in a comment by an anonymous presidential aide to a *New York Times* reporter:

> "Congress is lazy, too," said a Presidential aide, pounding his fist on his desk for emphasis during a recent interview. "They work short hours. They don't know how to consult. They say they want to consult with the President, but then they come up here and don't say anything.
>
> "They criticize us for not advising or consulting them in military matters," he continued. "But they cannot keep a secret. If we tell them anything it is out within 30 minutes after they have gone back to the Hill."
>
> This attitude toward Congress runs deep in the White House, and it underscores the seriousness of the constitutional struggle being waged between the executive and legislative branches of the Government as President Nixon, wielding perhaps more power than any President in history, moves into a second term with a landslide victory behind him. [Herbers, John, "Nixon's Presidency: Crisis for Congress," *The New York Times*, March 5, 1973]

The confirmation hearings for Brinegar and Krogh, as well as Secretary-designate of Housing and Urban Development Lynn included attempts to understand how Nixon's plan would affect the two departments. Senator Cannon asked Brinegar about reports that in offering the Cabinet post, the President "told you that you were not to report to him, but were to report to James Lynn . . . who will report to Mr. John Erlichman [sic], counsel to the President, who will report to the President." Cannon asked if the report was true. Brinegar said:

> No, sir, I do not believe it is . . . . The President and I did not discuss such a reporting relationship. The President expects me to serve as the Nation's principal transportation adviser to him, and to enforce the 1966 statute that established the department.

After listing some of the Secretary's duties specified by law, he said:

> I personally would rather work with Secretary Lynn, Secretary [of the Treasury George] Schultz, or Mr. Erlichman [sic] in resolving some of these matters than I would with some White House assistant whose role I am not sure of. And I think in this respect it is an improvement over what I understood to be the previous relationship.

As for Lynn's role in DOT business, Brinegar said, "I don't know. I view that he and other counselors [sic] will serve as chairmen of a group where we will discuss the issues and work them out." He added, "If I feel strongly about certain matters I feel that I have a right to go higher."

> Senator Cannon. Going direct to the President?
> Mr. Brinegar. Yes, sir.

Senator Cannon asked about "numerous reports in the press" that Krogh "will actually have responsibility for the Department, and that your role as Secretary will be to provide the administrative leadership and coordination within the Department." Brinegar denied that these reports were correct:

> The Under Secretary, Mr. Krogh, will serve as my alter ego, as Under Secretaries traditionally do, representing me in matters I assign to him . . . . I plan to be in charge. [*Nominations-January 1973*, p. 14-16]

Senator Hartke raised the subject with Krogh:

> Senator Hartke. Who are you going to report to ultimately, do you know? The Secretary or somebody at the White House?
> Mr. Krogh. I report to Secretary Brinegar.
> Senator Hartke. I know officially; I mean unofficially.
> Mr. Krogh. Unofficially I report to Secretary Brinegar.
> Senator Hartke. Are you the real hatchetman down there?
> Mr. Krogh. No, sir.
> Senator Hartke. My understanding was that that was what you were put there for, to watch the Secretary so he didn't get out of line.
> Mr. Krogh. No, sir. I just hope to stay out of trouble. He is going to be watching me. [*Nominations-January 1973*, p. 82-83]

Secretary-designate Lynn's confirmation hearing before the Committee on Banking, Housing and Urban Affairs, chaired by Senator Sparkman, was on January 17. Lynn, a native of Cleveland, was a lawyer who left private practice in 1969 to become General Counsel at the Department of Commerce. Lee described Lynn:

> James Lynn was a conscientious member of the president's political team. He wanted to be a team player from the White House perspective. Coming from the Commerce Department, where he had been general counsel and then the undersecretary, Lynn was a novice to community development, but he had faith in his ability to master new policy areas. In a sense, he represented the underlying philosophy of generalist public administration. A person with generic managerial talents was expected to be able to oversee just about any policy portfolio.

Naturally, the hearing concerned primarily housing issues, including impoundment of funds. But Lynn's role as counsellor did prompt questions. The new member of the committee, Senator Biden, said he was confused by Lynn's dual roles. As counsellor, would he be responsible for coordinating five departments? "No. Not departments," Lynn explained. "It is by function. It is activities within departments." Then, Senator Biden asked, if Congress wanted information on mass transit programs, should it go to Secretary Brinegar or counsellor Lynn? Lynn replied:

> The President also made every [sic] clear that the responsibility for the Department of Transportation lies with the Secretary of the Department of Transportation. Therefore, the primary person that would be called in that connection would be the Secretary of Transportation.
>
> On the other hand, if the issues involved were ones that did relate, that were of extreme importance, that have a relation to this coordinating role—in other words, they do impact on other programs of the Government—and you thought it well—if the committee decided to call me to ask me about that particular problem, they could call me . . . . But it is true that I can be called and the Secretary of Transportation could be called. I would assume you would definitely call him and you might call me. [*Nomination of James T. Lynn*, Hearing, Committee on Banking, Housing and Urban Affairs, United States Senate, 93rd Congress, 1st Session, January 17, 1973, p. 50]

Lee remarked that of the three counsellors, Weinberger was the most aggressive and Butz the least interested in his secondary role. Lynn was in between, recognizing that he was a manager without expertise in his program areas. As counsellor, he focused on Housing and Urban Development and the community development programs of DOT and Agriculture. As he saw it, transportation and economic development were inherent in solving urban problems that he was responsible for as Secretary. He had explicit interest in highway and mass transit legislation. [Lee, p. 135, 139]

One More Passing

The State highway agencies, in cooperation with FHWA, continued steady progress on construction of the Interstate System. As of December 31, 1972, a total of 34,393 miles or 80 percent of the 42,500-mile Interstate System was in use. FHWA's quarterly press release on the status of the Federal-aid highway program stated:

> As currently designated, the System consists of 34,385 miles of rural and 8,115 miles of urban highways. As of this report, 27,826 miles or 80.9 percent of the rural mileage, and 6,567 miles or 80.9 percent of the urban mileage were open to traffic.

Secretary Volpe was quoted as saying:

> This represents an addition of 1,405 miles completed in the 12-month period since December 31, 1971. It reflects the steady progress being made in constructing this, the safest and best engineered highway network in the world.

Overall, work had been completed or was underway on 98 percent (41,709 miles) of the Interstate System. "Only 791 miles, or 2 percent, have not yet advanced to the point where location public hearings have been held."

Thus far, the States had put $49.94 billion to work on the Interstate System since the Federal-Aid Highway Act of 1956 had authorized the accelerated program:

> As of December 31, 1972, work estimated to cost $12.97 billion was underway or authorized, including $8.86 billion of construction; and $4.11 billion of engineering and right-of-way acquisition.

The accelerated program had largely been the work of President Eisenhower and three Members of Congress. The former President had died on March 28, 1969. Senator Gore, one of the three Members of Congress who were the primary authors of the 1956 Act, had focused on foreign affairs and taken little interest in highway matters through the 1960s until he was defeated for reelection in 1970. The second, Representative Fallon, had remained intimately involved in developing highway legislation and protecting the Highway Trust Fund until he, like Gore, was defeated in his 1970 reelection bid.

The third, Representative Boggs, had incorporated the Highway Trust Fund concept into the 1956 Act and fought to protect its integrity for years. However, he had moved into leadership roles in the House, first as Majority Whip in 1962 and then as Majority Leader in January 1971. In these roles, he was less involved in fighting for the integrity of his creation.

When Representative Myers issued his quorum call to kill the Federal-Aid Highway Act of 1972, Boggs was not in Washington. He was in Alaska making campaign appearances for Representative Nick Begich, who had defeated banker Frank Murkowski to win election in 1970 as Alaska's At-Large Representative. Now he was facing a tough reelection campaign against Republican State legislator Don Young.

On October 16, the Cessna 310C carrying Boggs and Begich left Anchorage and disappeared before reaching Juneau. A search for the plane and its occupants was abandoned in late November. They were never found. (Begich won the election posthumously, but Young won a special election to fill his seat and would go on to become Chairman of the House Committee on Transportation and Infrastructure (2001-2007) with jurisdiction over the Federal-aid highway program.)

For Majority Leader in 1973, House Democrats selected Representative Tip O'Neill, who was looking for a way to transfer Interstate funds intended for the Inner Loop through his Boston district to transit.

As consideration of the Federal-Aid Highway Act resumed in 1973, the three authors of the 1956 Act that made construction of the Interstate System possible were no longer in Congress to defend their creation.

State of the Union

President Nixon, in creating the counsellor initiative to insulate him from domestic affairs, also showed his disregard for Congress by deciding against delivering a State of the Union Address in 1973. Instead, he released a series of "State of the Union Messages to the Congress." They covered:

- Overview and Goals (February 2, 1973)
- Natural Resources and the Environment (February 15, 1973)
- The Economy (February 22, 1973)
- Human Resources (March 1, 1973)
- Community Development (March 8, 1973)
- Law Enforcement and Drug Abuse Prevention (March 14, 1973)

The messages on Natural Resources and the Environment and Community Development addressed transportation issues.

President Nixon began the message on Natural Resources and the Environment by stating that:

> When we came to office in 1969, we tackled this problem with all the power at our command. Now there is encouraging evidence that the United States has moved away from the environmental crisis that could have been and toward a new era of restoration and renewal. Today, in 1973, I can report to the Congress that we are well on the way to winning the war against environmental degradation—well on the way to making our peace with nature.

He took credit for NEPA, which "has reformed programs and decision-making processes in our Federal agencies and has given citizens a greater opportunity to contribute as decisions are made." The Council on Environmental Quality, established under NEPA, and EPA were among the reasons why, "Day by day, our air is getting cleaner; in virtually every one of our major cities the levels of air pollution are declining." Looking forward, the President said he would be guided by five principles:

- The first principle is that we must strike a balance so that the protection of our irreplaceable heritage becomes as important as its use.
- Second, because there are no local or State boundaries to the problems of our environment, the Federal Government must play an active, positive role.
- Third, the costs of pollution should be more fully met in the free marketplace, not in the Federal budget.
- Fourth, we must realize that each individual must take the responsibility for looking after his own home and workplace.
- Finally, we must remain confident that America's technological and economic ingenuity will be equal to our environmental challenges.

He had been disappointed that Congress had not approved many of his legislative proposals, including:

> Controlling Environmental Impacts of Transportation. As we have learned in recent years, we urgently need a mass transportation system not only to relieve urban congestion but also to reduce the concentrations of pollution that are too often the result of our present methods of transportation. Thus I will continue to place high priority upon my request to permit use of the Highway Trust Fund for mass transit purposes and to help State and local governments achieve air quality, conserve energy, and meet other environmental objectives.

He returned to this theme in his March 8 message on Community Development. The President indicated he would submit a bill called the Better Communities Act to extend revenue sharing to community development. "The Better Communities Act is intended to replace inflexible and fragmented categorical grant-in-aid programs, and to reduce the excessive Federal control that has been so frustrating to local governments." He also planned to again seek approval for a Department of Community Development to consolidate programs from Housing and Urban Development, Transportation, Agriculture, and other agencies:

> The Department of Community Development will be a constructive center in the Federal Government for assistance to communities, large and small. It will facilitate rational planning, orderly growth, and the effective employment of resources to build viable communities through the United States. It will help to strengthen the physical and institutional bases for cooperative action by Federal, State and local governments.

After discussing first term housing initiatives, Nixon turned to transportation, saying "Without better transportation, our communities will either stagnate or choke." He listed the Administration's transportation successes, including investment of $23 billion in highways (1970-1974).

The United States had "the best highway system in the world," but "the commuter who uses a two ton vehicle to transport only himself to and from work each day is not making the most efficient use of our transportation system and is himself contributing to our transportation and environmental problems." Good public transportation was essential for transportation and "to forward the common goal of less congested, cleaner and safer communities." In improving mass transit systems, "we must be aware of the two special challenges in coordinating the needs of the inner city and the suburb and in alleviating potential disruptions which new transportation systems can bring to neighborhood life." To accomplish this goal, he said:

> I recommend that the Congress authorize the expenditure by State and local governments of $3.65 billion over the next three years from the Highway Trust Fund for urban transportation needs, including capital improvements for bus and rapid rail systems. I also recommend continuing the rural highway program at the $1 billion a year level, and providing ample resources to advance the Interstate System as it approaches its 1980 funding completion date . . . .

> Some communities now feel unduly obligated to spend Federal monies on controversial Interstate highway segments in urban areas. I urge the Congress to allow States and localities to transfer such funds to the construction of other Federal-aid highways and mass transit capital improvements. In this way, we can help resolve controversies which have slowed work on a number of Interstate links in urban areas.

This was not, he explained, "an arbitrary Federal shift of funds from highways to transit." It was simply recognizing "the right of local governments to choose the best solutions for their urban transportation problems."

As a "companion measure to our Federal Highway Bill," he urged Congress to increase mass transit capital grants by $3 billion to a total of $6.1 billion. He also wanted Congress to amend the Urban Mass Transportation Assistance Act to increase the Federal share to 70 percent for capital grant assistance projects to achieve parity with non-Interstate Federal-aid highway projects.

Richard Rovere, a journalist and author who wrote the "Letter from Washington" column for *The New Yorker* (1948-1979), wrote in March that Nixon was "outdoing just about all his predecessors in gathering to himself as much power as possible and wielding it with clear purpose and remarkable vigor." This tendency had been evident in the first term, but Rovere continued:

> But the real evidence that Nixon has more zeal for his personal consolidation of power than for the diffusion of authority on which he has expended so much rhetoric has come in the last couple of months, in which he has reorganized his own branch of government, defied the Congress on a half-dozen issues, and sought to establish personal control over institutions that few President have ever regarded as adversaries.

Presidents usually favored a Cabinet of diverse backgrounds and opinions. Nixon, by contrast, "wishes to preside over a government all of whose members speak as he speaks and do as he tells them." With the possible exception of Kissinger, no one at the White House or in the Cabinet was known to "harbor views differing in some degree from those of his patron":

> All in all, the aides are a rather drab and undifferentiated group, but in the President's mind this may be an asset, since he is able to stand out in their midst and impose his discipline with ease.
>
> Last year's congressional elections and the recent Administration behavior toward Congress have increased congressional resistance to the White House, and it is currently an open question whether, no matter how strenuous an effort he makes, Nixon will get the legislative actions he called for in his astonishing series of State of the Union Messages.

Any successes would come only after "some of the most acrimonious debate heard here in years."

Rovere thought the President's revenue sharing proposals had a chance of success:

> This would be politically astute, because it would win for the White House a constituency it now lacks—governors and other high state figures—while further reducing the authority of Congress and of the professional bureaucracy here.

It also might have initial popular appeal because of "the American myth that there is more concern, understanding, and sound judgment in local units of government than in this remote and (as the myth has it) heartless capital." Despite the growing "spirit of resistance [that] has been growing at a brisk pace in Congress," the President remained popular and revenue sharing had some appeal on Capitol Hill. [Rovere, Richard, "Letter from Washington," *The New Yorker*, March 24, 1973, p. 142-143]

Professor J. Brooks Flippen put Nixon's message on Natural Resources and the Environment in perspective. Although President Nixon approved numerous lasting environmental measures, he saw the environment primarily in political terms. Having won his final election in November 1972, he had little interest in pursuing environmental battles as he tried to rein in government expenditures:

> The battle, as Nixon termed it in one interview with the *Washington Star*, was to "shuck off" and "trim down" domestic programs. The man who two years earlier had created EPA now plotted another offensive against a government "too big and too expensive." Predictably, with the election a memory, it did not bode well for the environment.

The selection of Secretary of Agriculture Butz as the counsellor overseeing the Council on Environmental Quality and EPA was revealing:

> The environment predictably stood as a major Nixon target. Butz, now operating in his new capacity as natural resources counselor [sic], made this point clear in a policy paper submitted just after the new year. "There are many more important things than the environment," Butz wrote. The issue had not hurt the president in the election and he had no reason to champion the cause now. "In all likelihood environmental problems will be solved by science," Butz continued. Nixon should place environmental protection "in the correct order of priorities."

In his budget proposal for 1974, the President had proposed to cut environmental enforcement while promoting some activities that environmentalists opposed, including the Tennessee-Tombigbee Waterway and new advocacy of the SST:

> With his budget before Congress, Nixon's annual environmental address surprised no one. The message, [Richard W.] Fairbanks [III, Associate Director for Natural Resources of the President's Domestic Council] acknowledged beforehand, "will replay our triumphs of the past" and add "general rhetoric and exhortation." Ehrlichman, terming the Clean Air Act a "complete failure," advised an aggressive defense of the administration's position. Nixon did not disappoint him and essentially declared the environmental crisis over.

Flippen quoted passages from the message about the success of the Nixon Administration's efforts and the principle that guided it. [Flippen, J. Brooks, *Nixon and the Environment*, University of New Mexico Press, 2000, p. 186, 190-191]

Setting the Stage for Action

In January 1973, the sides in the longrunning battle over the highway legislation were looking ahead to the upcoming fight. *Highway User* magazine, published by HUFSAM, expected 1973 to be "a decisive year." Although it expected the "tug-of-war" to resume, the magazine saw the possibility emerging of "reasonably adequate financing" for highways and public transit. "The compromise could come in proposals to establish a separate trust fund for Federal-aid to urban areas faced with the need to expand and improve public transportation facilities."

Highway officials were coming around to the concept, but transit officials also recognized that tapping the Highway Trust Fund would not provide enough funding to meet urban needs. Robert M. Coultas of the Institute for Rapid Transit said "there is not enough money in the Highway Trust Fund for both." The institute had supported a total transportation trust fund or the opening of the Highway Trust Fund, but it also supported highway improvement because "good transit depends upon good highways and roads."

Stanley H. Gates, Jr., president of the American Transit Association, said that transit's needs "can be met only with sufficient funds to support all transit operations, improve and extend existing bus and rail systems, and help build the several new rail systems now being supported by local areas." Making a limited amount of highway funds available "does not deal with this issue."

The "thorny question" was where the revenue would come from for a Mass Transit Trust Fund. This question "will be among the forefront of those to be faced" in 1973.

The State highway agencies were facing slowdowns in the absence of new authorizations, while "approximately $1.9 billion in highway funds have been held in reserve" because of impoundments. These problems were compounded by environmental restrictions, such as NEPA:

> Although highway departments have come to appreciate the environmental impact statement as a positive element in the planning process and an efficient mechanism for improved coordination among highway planning agencies, the process has slowed highway expansion and has, in many instances, forced federal highway officials into court.

Efforts to improve air quality and control motor vehicles in central business districts were among the problems "heaped" on the others. To comply with air quality standards, EPA was considering gas rationing in some areas, while municipal governments were considering "rigid traffic curbs such as high fees for commuter parking, bans on daytime deliveries by heavy duty trucks, drastic cutbacks in areas available for parking, prohibitions against single passenger automobiles, and staggered working hours."

Governor Sargent, the article stated, had taken "the most drastic action of this sort to date" by canceling $1 billion worth of Boston expressways and curbing increased downtown parking. "The third portion of his transportation program for Boston is a proposed $1.5 billion 15 year expansion of mass transit facilities, anticipating at least two-thirds of this to come from federal funds."

The article referred to the Administration's support for using Highway Trust Fund revenue for mass transit and for giving local officials a greater say in transportation decisions. It quoted Acting Administrator Bartelsmeyer's comment, "There will be no retreat from that general position." Still, given that needs exceed Highway Trust Fund revenues, the article said that "transportation specialists are asking why the Highway Trust Fund should be tapped for projects unrelated to highway transportation, especially when the money is derived from special taxes on highway users who are entitled to the improvements they pay for." The answer, the article concluded "will determine in large measure the future of transportation in the United States." [Talbott, William R., "Prospect '73," *Highway User*, January 1973, p. 1-6]

One of the controversial topics during development of the legislation was expected to be the highway beautification program. "The battle lines are drawn," the *Washington Star-News* declared on January 1, 1973, "for a fierce behind-the-scene fight over an issue always in public view: the highway billboard." The article stated that 700,000 to 800,000 billboards were illegal under the Highway Beautification Act of 1965. Only 70,000 had been removed, but "erected in their place through a loophole in the law have been more than 2,500 'jumbo' signs—some 60 feet high—that tower along some of the most scenic stretches of federal road." The industry was seeking a 2-year moratorium on removal of "directional" signs before 1975.

The House and Senate had included the moratorium in the failed Federal-Aid Highway Act of 1972. In 1973, billboard opponents expected the moratorium to resurface, only weaker. As included in the House version of the 1972 Act, but rejected by the Senate, Chairman Blatnik and other key members favored a provision that would allow six directional signs along each mile of rural road for a net addition of 400,000 billboards. George McInturf, chief of FHWA's beautification program, said the provision would "cripple the billboard removal program." Under Secretary Volpe, "We finally got the states to take action after threatening to cut off a portion of their highway funds." If Congress gave the States a break now, "pulling all the teeth in the world will not make them start again."

The Highway Action Coalition, National Wildlife Federation, and other national environmental groups were coordinating an attack on efforts to weaken the Highway Beautification Act. Ken Hampton of the NWF was optimistic. "Last time, the billboard lobby caught us with our pants down. It won't happen again." [Bernstein, Peter J., "New Congress Faces Fierce Billboard Fight," *Washington Star-News*, January 1, 1973]

The coalition, of course, was primarily concerned about the overall bill. "It's not that we're against highways," Kramer said, "it's just that they don't always make sense." He was particularly optimistic because of changes in the makeup of the House Rules Committee, which might be less inclined to block funding for transit in 1973. Representatives William M. Colmer (D-Ms., the Chairman), William R. Anderson (D-Tn.), and H. Allen Smith (the ranking Republican from

California) had retired, making pro-transit Representative John Anderson the ranking Republican. (Representative O'Neill left the committee and was now Majority Leader.) Further, the November 1972 election had resulted in a net gain of between 15 and 20 Representatives willing to vote for diversion of highway funds to transit.

On the other side, highway advocates such as Randy Russell of ARBA thought that, "Our principal argument is that there are not enough funds in sight to finance the highway system." He predicted that opening the Highway Trust Fund to transit would "destroy the rationale for the fund – that highway users should pay for highways." ["Freeman [sic] Foes Prepare Next Road Block," *Jersey City (NJ) Journal*, January 17, 1973]

Asked by *The Wall Street Journal* if the highway program was at a crossroads, Representative Wright chuckled. "I don't think that's too corny." He said it was more like a rail crossing where "we have to figure out how to let both the highway traffic and the rail traffic move without a collision." The *Journal* said that the bill, once routinely approved every 2 years, "is sprouting all kinds of controversial side avenues, evolving into a legislative package that could have considerable impact on this auto-dominated society." Should Highway Trust Fund revenue be used for mass transit? Should the gas tax be raised to accommodate new uses? With the Interstate System 80 percent completed, should the focus shift to a 10,000-mile network of "junior" Interstates? Should the Federal Government rescue transit systems by providing operating subsidies?

Senator Baker had observed a new "spirit of compromise" and said, "I predict we'll get a highway bill fairly promptly." He favored diversion to mass transit, but Representative Wright wanted transit revenue to come from the general treasury. "I don't see them as rivals for the same dollar. It's a little childish to play off against each other."

Wright and other members of the House Public Works Committee feared that approval of a limited measure such as the 1972 Cooper-Muskie amendment would lead to additional poaching schemes. Senator Muskie lent support to that concern by stating that he wanted to use Highway Trust Fund revenue not only for buses and subways, but for enforcement of auto-exhaust controls:

> It appears that many, if not most, control systems aren't working properly and we know that some garages are disconnecting the devices for their customers.

Highway Trust Fund revenues, he thought, should be used to hire inspectors who would check each car's control devices.

Highway advocates such as Senator Bentsen argued that diversion of highway revenue would be too little to address urban needs. "I don't think that's doing mass-transit systems any favor," said Senator Bentsen, now chairman of the Subcommittee on Roads. "You ought to have separate funding for mass transit. I don't think there's enough money in the trust fund to take care of both." He and others hoped that providing general Treasury funds to mass transit would satisfy those seeking highway dollars. However, "If I had to predict, I'd say the result in the Senate probably won't be far different from last year" when the Senate approved the Cooper-Muskie amendment.

The gas tax was under debate as well. Senator Percy wanted to end the Highway Trust Fund and create a transportation trust fund that would receive additional revenue by increasing the gas tax to 6 cents (from 4 cents). Others advocated simply increasing the gas tax with the additional revenue credited to the Highway Trust Fund to maintain current highway funding levels while providing aid for mass transit. Senators Baker and Bentsen did not think an increase was likely. Bentsen said, "I'm not at this stage ready to endorse that as a solution." [Large, Arlen J., "The Highway Bill, Formerly Routinely Voted, Now is Enmeshed in Transit, Pollution issues," *The Wall Street Journal*, February 5, 1973]

Clearly, the rival lobbies were ready for the fight. The powerful highway lobby recognized that holding its position in the Senate would be difficult and that the fight would come down, once again, to the House. On the other side, according to *The Baltimore Sun*, the Highway Action Coalition was expected to apply the "muscle" for the fight. Kramer, according to the *Sun*, expected the Senate Public Works Committee to split evenly on the diversion of Highway Trust Fund revenue, but he expected the Senate as a whole to vote as it had in 1972. He viewed the House Public Works Committee as "hostile to mass transit interests," but as noted earlier, was encouraged by the departure of pro-highway members of the Committee on Rules. The battle would be won, he predicted, on the House floor and he expected it to be a close fight. [Nordlinger, Stephen E., "Key Road-Aid Battle Looms," *The Baltimore Sun*, January 15, 1973]

The Advocates on PBS

On January 25, 1973, Boston's Public Broadcasting Service (PBS) affiliate, WGBH, was in Faneuil Hall taping an episode of *The Advocates*, a weekly debate program that appeared on PBS from 1969 to1974 with support from the Ford Foundation. Advocates argued for and against a proposition, calling witnesses who were questioned and cross-examined. The program then invited viewers to send postcards to vote for the side they favored. On this episode, the proposition was:

> Should half of the federal dollars reserved for highways be diverted to mass transit systems?

U.S. Representative Margaret M. Heckler (R-Ma.), an attorney from Boston, was the guest moderator. Former State Representative Michael Dukakis, a frequent moderator of the program, argued pro and Eric Julber, an attorney from Carmel, California, took con.

Dukakis began his defense of the proposition by saying:

> The automobile is choking our cities, ripping up our neighborhoods, polluting our air, and in New York City, today, traffic moves more slowly than it did in 1900. It's time to end this nonsense. It's time to give the states and metropolitan areas of this nation the right to use their share or part of their share of the federal highway dollar for the mass transportation systems they desperately need.

Julber responded in the negative:

> The proponents of mass rail transit are well meaning. But we expect to show you that the so-called benefits of mass transit are a myth. And certainly there should be no invasion of highway trust funds, which is the money that you and I pay for our highways when we buy each gallon of gas. Keep an open mind on the question until you hear our side, and we think you will vote no.

Dukakis asked his first witness, former Secretary of the Interior Udall, how he felt about voting, as a member of the U.S. House of Representatives, for the Federal-Aid Highway Act of 1956. Referring to Representative Wright, another witness in the studio, Secretary Udall replied:

> Congressman Wright and I were classmates [in the 84th Congress], and this was the first, I think, really big piece of legislation in our first term [that] was enacted. Looking back, this is hindsight, of course, I voted for it, I think that I made a mistake. I think that it was one of the big blunders of the 1950's. Not that I don't think we needed a basic trunk interstate highway system to connect the main urban areas, but I think we put all of our eggs in the automobile basket; and that was the mistake.

What, Dukakis asked, should we have done instead?

> Well, I think, looking back, and this is all hindsight, that what we needed in the 1950's was a national transportation policy. And I think that we needed a national transportation fund. The idea of earmarking moneys and saying this will be used only for highways . . . meant that we went down the wrong road. We should have given attention to our railway systems, mass transit, bicycle paths, the whole works, and have that kind of balanced flexible system, letting the states and the cities decide essentially how they wanted to use their money.

Asked his opinion of the automobile, Secretary Udall said:

> If you ask me to single out the one most destructive thing on the American environment, it's the automobile. The pollution of most of our cities, the automobile is the main contributor. It and its highway system have squandered our land. The noise problem that's rising in most cities is primarily automobile. And certainly, it's been wasteful all the way around. And I would add the final factor. We thought that this was going to reduce the number of automobile deaths. It hasn't. And I think that's part of the tragedy.

Julber, during cross-examination, suggested to Secretary Udall that mass transit was the actual cause of the problem. He cited New York City as an example because the availability of the country's largest subway system supported "an insane density of people." However, Secretary Udall would not concede that sprawling development would be better, pointing out that "we're running out of land in this country, of land that's prime land for cities; and we're finding already that one of the big mistakes we've made is sprawling too thin." The trend, he said, was "toward compactness and cluster."

Julber responded that "people around the country are proving they don't want to be compacted. Every man wants to move out in the suburbs." Secretary Udall cited new towns such as Columbia, Maryland, and Reston, Virginia, as based "on the idea of cluster." Based on building permits, he added, "we're going to more and more low-rises, apartments, townhouses, and so on because we're running out of land."

If the Nation were going to switch to rail mass transit, Julber asked, where was the additional electricity going to come from when already "on the East coast, I read about brownouts and blackouts"? Secretary Udall could not say how the additional electricity would be generated, but added:

> Well, we're going to have to generate it, but that electricity, because of the efficiency of mass transit, will use far less energy than the automobile, which is the most wasteful vehicle we've ever come up with.

The next witness for Dukakis was Governor Sargent. Asked about his major policy decision on transportation, the Governor answered:

> What we essentially decided was that we were not going to continue to build eight-lane, 10-lane, 12-lane highways into the city of Boston. We just can't do it. We cannot continue with that. Instead, we're going to build rapid transit. We're going to improve bus service. We're going to build tunnels for restricted use of emergency vehicles, and so on. And we're going to turn the thing around and not have a total reliance for the commuter on the automobile, the way we have at the present time.

He discussed the Boston transportation review he ordered:

> And clearly it showed to me that we would have to have a balanced transportation system. But we're not saying that we're never going to have any roads. But we're not going to build any more interstate highways into this city. And this was one of the clearest indications that we got from the study. And the study wasn't merely a highway study. This was a study made by architects and engineers and social economists and others. I'm positive we're doing the right thing for this city.

Dukakis asked if Governor Sargent faced any problems with his plan.

> Well, the principal problem is one of money. And this is why I feel that we should be able to turn to the highway trust fund, that the highway trust fund shouldn't be purely for highways, that each state should be able to decide how to use the available money for transportation. Obviously, the situation in Massachusetts is not going to be the same as in Montana. But today you've got to spend that money on highways.

Was the Governor facing pressure to spend that highway money? "Oh, tremendous pressure, very obviously."

But would people get out of their cars to use Boston's new transit options?

> Oh, I'm positive they will. We have a new line going to South of Boston; it's about nine miles long. It's got an increasing usage of some, I think, 25,000 people that are using it today. It isn't the best that we can have. I think that we can look to the future. But it is fast, it is clean, it is on time, and it is much better. Now, the old rickety system, granted, is nothing but chaos.

Did other Governors agree with his decision?

> Well, you know, it's interesting. We had a meeting of the Governors' Conference back a few years ago, and virtually none of the governors were in favor of busting the trust fund. But at the last meeting of the governors, they all saw the benefit. They realized that they would be able to have flexibility and be able to make decisions that were proper for them, and we could make decisions that were proper for us in Massachusetts.

When Julber's question time came, he asked the Governor if his decision was universally popular. "No," Governor Sargent answered. "I don't think you can face any sort of a transportation question, be it in the city or be it in the rural areas, that there isn't going to be a heck of an argument."

The Massachusetts Bay Transit Authority (MBTA) operated one of the country's biggest subway transit systems in Boston. Despite all the so-called need for transit, Julber pointed out, the authority lost $70 million in 1972. "Now, if you build it any bigger, won't it just lose more money?" Governor Sargent pointed out that the automobile industry is spending a billion dollars a year just to advertise automobiles and "to drag people away from using mass transit." Overall, the country was spending "billions and billions and billions and billions of dollars building highways and just a tiny fraction for mass transit."

If Boston wants a bigger subway, why can't officials use local funds, or use the $180 million the State received in General Revenue Sharing?

> We're putting money into the improvement of our rapid transit. We're building more. But what I don't want to do is, just because the money is there, go ahead and build more highways right into the middle of the city of Boston. I, frankly, want Boston to be different from Los Angeles, if you really want to know.

But hadn't Boston brought on its own problems? "Five years ago, you rebuilt downtown Boston with a lot of federal money, great skyscrapers. Your skyline rivals New York." How, Julber asked, "are we going to get all these additional people in and out of this little area of land?"

Governor Sargent replied:

> Twenty-five years ago, we designed a highway system that made sense then, we thought. But we learned that it would be disastrous for that city because when the interstate system—and I don't disagree with the interstate system, I favor it, I think it was a great thing for this country—but when we started building these interstate highways through and into cities,

> they were used for commuters and not for interstate purposes, they were polluting the air, and they were tearing the cities apart. And I don't want to do that anymore.

Julber introduced his first witness, Professor Hilton, the Economics Professor from the University of California who challenged the value of rail rapid transit. Was rail rapid transit, Julber asked, suitable for modern needs?

> Well, not at all because it serves essentially only the trip into a central business district which is declining very rapidly. As recently as 1960, about 11 percent of all trips in Chicago were to the Loop. It's down to about eight percent now. It's expected to be down to five percent by 1980.

But doesn't mass transit decrease automobile traffic? Professor Hilton said it did not. "What it does is quite consistent between the new installations." He cited the new line to Quincy that Governor Sargent had mentioned. It diverted fewer than 1,000 vehicles a day from the parallel Southeast Expressway. "That expressway carries between 80,000 and 120,000 vehicles in the ordinary course of working days. And so the thousand vehicles is imperceptible relative to that variance and also to the growth, which is usually about four percent per year." He pointed out that the city could "do approximately the same thing with buses on thoroughfares for about two percent of the investment."

But what about the great new BART system in the Bay Area? Professor Hilton pointed out that it had cost $1.5 billion and was expected, by its proponents, to divert about 5 percent of trips from the automobile into the area, "which would make its experience consistent with what I've just mentioned." It cost about $2 per passenger for riders who were paying an average fare of 64 cents. "The rest will be made up by the subsidy."

Does transit help poor and minority groups?

> No, because all it does, essentially, is provide a higher quality trip into a central business district. The trip which they find most difficult in making is from an urban residential area, a ghetto, to outlying places of employment. And linear systems of all sorts, and I include buses in this, are too inflexible to provide this trip for them.

Are these systems economical for the country?

> Oh, no. A high official of the Department of Transprotation said quite straightforwardly that only two percent could be justified by fare box revenues.

Then what is the more sensible answer to urban transportation problems?

> Well, the main thing we need is a different system of charging people for the use of the roads, something to replace a flat tax on gasoline, something which will charge people more for driving in rush hours than in off hours so as to give them an incentive to use buses or existing rail systems. Second, we need more circumferential freeways, like Routes 128 and

> 495 here [and] the beltways around Washington and Baltimore. And third, we need competitive taxicab and bus systems, which is to say, jitneys as distinct from monopolized or Cartelized ones, to make public transit more demand responsive.

Dukakis, in rebuttal, pointed out to Professor Hilton that HUFSAM predicted that the country would add 66 million cars by 1985, for a total of about 188 million. "How many more highways and interchanges are we going to have to build to accommodate those cars?" Professor Hilton replied:

> We're certainly going to have to build a great many more highways, mainly in rural areas and the circumferential routes which I mentioned because that's where the major increase in trips is. I think building additional radial facilities, paralleling the Southeast Expressway here with another expressway of that sort, is as wasteful as building your Quincy Rapid Transit Line has been. Basically, both of those are symptoms of the fact that the way in which roads are at present priced tends not to inhibit people from using automobiles for peak hour service. And so, you get the excessive demand for investment just to deal with peak hours. We have the same problem with [the] Panama Canal, airports, and a large number of others.

He didn't recommend closing existing transit systems. "I'm arguing against investing in additional ones."

As for those beltways in the Boston area, Dukakis pointed out, "One of them is absolutely jammed beyond capacity, and the other is on its way." How many more beltways would be needed to relieve congestion? Professor Hilton answered:

> [Given the] present nature of all pricing, you're going to have a saturation of most urban facilities in any case, whether or not you build rapid transit and whether or not you build additional roads. What it is is just a standard example of elementary economics courses, is that you get queuing when you give away anything free.

He favored increasing the cost of driving to encourage the use of transit, mainly buses. Then, Dukakis said, "you would favor a fairly substantial expansion of bus systems, at least, if not rail rapid transit." The professor said;

> That would very automatically come because one of the consequences of this form of pricing would be speeding up buses relative to automobiles. The only attraction of rail systems, essentially, is that they're out of those queues of vehicles, which the nature of present road pricing creates. By speeding up the buses, we make them more attractive relative both to the automobiles and the rail systems.

Professor Hilton agreed with Dukakis that bus systems did not operate at a profit and required a subsidy, but pointed out that current bus systems were monopolies operating on routes inherited from the unprofitable streetcar lines. "If it were a competitive industry of owner-operated buses, it would be very cheaply operated."

Shouldn't the people of Massachusetts have the right to tap the Highway Trust Fund for transit if that is what they think they need? Professor Hilton did not want to defend the Highway Trust Fund, but he pointed out that people "vote with their feet," by which he meant that they "tend to leave public transit as it is presently organized."

Julber's final witness was Representative Wright. They discussed the nature of the Highway Trust Fund and its use for construction of the Interstate System and other Federal-aid highways. Then Julber asked what Representative Wright thought about the claim that highways create congestion?

> Well, of course, that isn't true. That's like saying hospitals create disease. You get the hospital, and you get it full pretty soon. Are we going to stop building hospitals because they're full?

Do good highways help relieve air pollution? "Well, good highways do, and they should." Circumferential highways keep vehicles out of the congested center city, thus relieving air pollution to an extent:

> [It] has been estimated that 12 automobiles travelling on a freeway at a reasonably steady pace emit less carbon, less pollution into the air than one automobile moving on old style streets, stopping at every traffic light over the same distance.

Did Representative Wright agree with Secretary Udall that decentralizing of the cities is a bad thing?

> Well, it seems to me that it isn't a good thing just to tell American citizens that they've got to congest even tighter into greater population density. It seems to me that population density is a serious and growing problem and that it contributes an almost geometric progression to the root of every social ill that we have, from environmental pollution, to crime, to psychosomatic illness, to human instability; and it strikes me that if the American public wishes, and I think manifestly it does wish in a large degree, to spread out and get a little more privacy, to get a little bit of ground around them, have a little more pleasant life, it isn't the business of government to tell them that they can't do that.

The Department of Transportation identified $600 billion in needed highway work over the next 20 years. Is that all for new roads? Representative Wright said that only about 1 percent of the money would be for new roads. The "remainder would go for widening, broadening, and making safer the highways that already exist."

Julber's final question was, "Do you think it would be wise or fair to invade that highway trust fund when we have those highway needs over the next 20 years?" Representative Heckler requested a brief answer because Julber's question time was running out. "No," Representative Wright answered, "I think we can meet mass transit needs without invading the highway trust fund."

Dukakis explained that Governor Sargent just wanted the right to decide how to use Highway Trust Fund revenue in Boston. "Now, what's so bad about that?" Representative Wright pointed out that he was the author of a proposal included in the Conference Report on the failed Federal-Aid Highway Act of 1972 that would have let Governor Sargent trade in unwanted expressways for an equivalent amount of obligational authority. "Not out of the highway trust fund, no." He continued:

> What's your objective? Do you want money for mass transit? If so, we'll give it to you. Or do you want to stop highways? I think we need them both. I think this country can afford them both. I think we need all the money that's available in the highway trust fund to build the highways that we need for safety for America's public.

Wouldn't President Nixon simply impound a lot of that transit funding, Dukakis asked, adding that we "can't be sure of anything the Nixon Administration's doing these days"? Representative Wright said that in deference to Republican Governor Sargent, he did not want to get into a debate on President Nixon:

> What I'm saying is that I think our needs for highways are very massive throughout the country, but we don't have too much money coming in from this highway users' tax to pay for it, that there are other ways that mass transit can be financed and it should be financed just as other things are financed.

In fact, Representative Wright wondered why Dukakis thought "the only solution is the highway trust fund." Dukakis replied, "That's where the money is, Congressman, paid by the taxpayers." Representative Wright countered:

> That's not the only place where the money is. Oh, by all means, no. That money's all obligated. There isn't any surplus in the highway trust fund. Every penny in the highway trust fund plus some has already been obligated to the States . . . . for the construction of needed highways throughout the United States . . . . Now, if you want to spend money, rather than for urban expressways in the heart of Boston, on mass transit, fine. I'm for a system that would give you that money. But don't take it away from the highway program because we need that to complete the highway program that people all throughout this country have been paying into it on the good faith assumption that their money was going to build safe highways for them, and they don't ever come near Boston . . . . I'll work it out for you. We can work it out. But you don't have to rob the taxpayers who put their money into the highway trust fund. That's money for highways. I say we can do both.

In a closing argument, Julber said he did not think the problems of 1973 could be solved by reverting to 1890s solutions:

> Rail systems to a crowded central city have gone the way of the horse and buggy no matter what kind of glamorous paint jobs you put on them. What we do need is to decentralize our cities . . . . We should continue to upgrade our highways. We should make cars smaller. We should stagger working hours, develop pollution-free engines and alternate sources of energy. But what we should not do is to invest further in systems that have proved to be

> failures in the past. And certainly there should be no invasion of the highway trust funds that are made up primarily of the pennies of the working people of this country.

Dukakis closed his argument by expressing some bewilderment because "the wisdom of the proposal we've been debating tonight seems so obvious that it's hard to understand how anyone could seriously oppose it." He continued:

> Mass transit for all of us, city resident and suburbanite as well, it's a good thing. And that working man that Mr. Julber has been talking about has been paying through the nose for highways that won't work and can't work here in the United States.
>
> We're not asking the government to order a mandatory shift of highway funds to mass transit. No, all we're asking is that the people of our states and metropolitan areas be given the right to decide what kind of transportation system they want and the right to use, not all, but just a part of the highway money they've paid in to the federal government for that transit system, if they want it. So if you've ever sat and fumed for hours on an expressway in a traffic jam and wondered if there wasn't a better way, if you've ever watched in horror as bulldozers ripped down another neighborhood for another one of these 10-lane monsters, if you're wondering if your favorite park is next on the highway builder's list, now's the time to send those politicians in Washington a message. We hope you'll vote a resounding, "yes," on tonight's proposal.

Representative Heckler concluded the show by reminding viewers to send their post cards to *The Advocates* to vote "yes" or "no" on the show's proposition. The results would be revealed on the following week's program. [http://openvault.wgbh.org/catalog/9576b8-should-half-of-the-federal-dollars-reserved-for-highways-be-diverted-to-mass-transit-systems]

(According to a 1979 book by Altshuler and coauthors on urban transportation, the Quincy extension opened in September 1971:

> Vehicle counts several months later on all major road facilities in its corridor revealed that whereas traffic had previously been increasing by about 4 percent a year, it was now up about 7.5 percent from the year earlier figure. Although no one attributed the acceleration of traffic growth to the transit opening, there was certainly no basis for contending that it had produced any congestion relief. [Altshuler, Alan, with Womack, James P., and Pucher, John R., *The Urban Transportation System: Politics and Policy Innovation*, The MIT Press, 1979, p. 369])

Ongoing Battles

While Washington anticipated the policy fight over the highway legislation, highways battles continued on the ground around the country as reflected in the following survey of activity in January 1973 based on news accounts:

- Environmental organizations plan to seek an injunction to block construction of a superhighway in the U.S. 7 corridor through Vermont, Massachusetts, and Connecticut. They want Federal officials to consider rail passenger service in the corridor. ["Three-State Attempts to Block Route 7 Corridor Idea is Due," *The Rutland (VT) Herald*, January 2, 1973]
- Connecticut highway officials began a new housing survey to determine the impact of I-291 on Bloomfield and Windsor following criticism in September 1972 from the Department of Housing and Urban Development that the route would "destroy" what it called "unique . . . stable and racially mixed neighborhoods." If replacement housing is not available for displaced residents, Federal officials may decide to authorize "last resort" housing as provided for under the Federal-Aid Highway Act of 1970. [Daniels, Jeffrey, "Survey to Gauge Effect of I-291," *The Hartford Times*, January 4, 1973]
- The FHWA ordered the Connecticut Department of Transportation to prepare an "overview" of the need for I-84 between Hartford and Providence. Environmental critics had accused the State of "segmenting" hearings to cover up the full impact of the road along its entire corridor. In Rhode Island, highway officials were considering a request from environmentalists for a 45-day extension of the comment period on the environmental impact statement for I-84. ["Conn. Ordered to Justify Rte. 94 Need," *The Providence Journal*, January 7, 1973]
- Secretary Walter L. Revell of the Florida Department of Transportation was still considering the routing of I-75 from the State's west coast to Miami. A study had recommended the Everglades Parkway (Alligator Alley) as the alternative that best met traffic needs, but Secretary Revell said the State was studying criticism of the route by the Florida Audubon Society, the Florida Wildlife Federation, and the National Wildlife Federation. They were concerned that routing I-75 along the parkway would sabotage plans to create a Big Cypress national firewater reserve in south Florida. "We are studying every criticism the wildlife people have made," Revell said. [Witwer, Stan, "State Road Officials Still Undecided on an Alligator Alley Route for I-75," *The St. Petersburg Times*, January 7, 1973]
- The Virginia Highway Department delayed widening a .8-mile strip of U.S. 1 (proposed I-595) in Arlington because of neighborhood objections and the absence of Federal funds following congressional failure to pass the 1972 highway legislation. The State said it would prepare an environmental impact statement and hold a new location and design hearing. [Mathews, Jay, "Va. Delays Widening of Route 1," *The Washington Post*, January 10, 1973]
- In Texas, Federal District Judge Jack Roberts ordered State and Federal officials to proceed with "all speed reasonable under the circumstances" with environmental impact and alternate route studies on the U.S. 281 North Expressway through parkland in San Antonio. This order was in accordance with an August 1971 Appeals Court ruling that State and Federal officials had not complied with Section 4(f) or NEPA in routing the highway. [Jackson, Wayne, "Highway Studies Ordered," *The Austin Statesman*, January 10, 1973]
- The Maryland Court of Appeals upheld a lower court ruling that the city's plan to route I-70 through Leakin Park did not violate the will of the late J. Wilson Leakin. The lower court found that the city's plan to exchange part of the parkland for improvements to the remaining part would not be a breach of trust. ["Court Upholds Leakin Route," *The Baltimore Sun*, January 10, 1973.

- In an effort to lessen the impact of Lake Freeway (I-794) on Juneau Park in Milwaukee, the County Expressway and Transportation Commission voted to put the freeway underground. This action was in response to environmentalists who had obtained a Circuit Court injunction on April 28, 1972, blocking construction through the park. ["Underground Expressway Plan Backed," *The Milwaukee Sentinel*, January 11, 1973]
- Following a barrage of protests, the Arizona Highway Department decided to reconsider the need for a third interchange on I-8 in Gila Bend, population 1,726. At a public hearing attended by some 300 citizens, residents argued that development around the interchange would siphon off business from the community. Representatives of the Papago Indian Reservation, who owned the private land near the interchange, favored construction because it would serve their planned industrial park. ["Controversial Interchange Plan Taken Under Study," *The Phoenix Gazette*, January 11, 1973]
- Chairman Charles E. Simons of the Texas Highway Commission told the Fort Worth Area Chamber of Commerce that the architects and urban planners who attack freeways are responsible for many of the urban ills they blame on the automobile. He cited the World Trade Center in New York, saying, "It is small wonder that they have congestion and strain transportation facilities . . . when they concentrate hordes of people in a few square blocks." He said that "the architects, environmentalists, sociologists, economists, urban planners and conservationists have been having a field day taking pot shots" at road building. "We hear very little protest against the dismal failure of the welfare, housing and urban development and scores of other costly programs which sap the moral fiber and vitality of the body politic." He added that it's the successful programs, such as road building, that are "the target for attack." ["Speaker Fires Back at Freeway Critics," *The Dallas News*, January 12, 1973]
- In West Virginia, the Kanawha County Regional Traffic and Arterial Study Committee wrote to Secretary Volpe and State Highway Commissioner William Ritchie urging them to halt all activity on continuation of the Danville-to-Charleston segment of Corridor G of the Appalachian Development Highway System except line "F" from Boone County to Charleston via Marmet. Line "F" would be shorter and would replace U.S. 119, while the approved line would require relocation of up to 9,500 feet of the Coal River – an option likely to result in environmental court suits. [Gallagher, Andrew, "Marmet Route Urged for Corridor 'G,'" *The Charleston Gazette*, January 17, 1973]
- An EPA official, David L. Calkins, held out little hope that mass transportation could solve the smog problem in Phoenix, Arizona. During a workshop on auto pollution, he said that the area's diversified traffic pattern made mass transportation impractical for emission reductions. Calkins suggested that better options included formation of car pools, rapid turnover of government cars, limited vehicle restrictions, and even the more drastic step of Federal limitations on land use to encourage a corridor concept that might make mass transportation feasible. State Representative Burton S. Barr told the workshop that 55,000 cars would have to be junked for failure to meet Federal emission standards. ["EPA Official Says Mass Transit Won't Work Here," *The Phoenix Gazette*, January 17, 1973]
- When Mayor William Donald Schaefer took office in Baltimore on December 7, 1971, he inherited a decision to build an I-95 tunnel near Fort McHenry instead of a signature bridge across the Inner Harbor. Residents objected that the bridge, a unique cantilevered design with canted support towers, would disrupt historic Federal Hill and Fells Point. The

planned tunnel, wrote City Hall reporter David Ahearn, will not be an international trademark for the city. It "will look like any other" tunnel. The new Mayor was not bound by the decision, but little support existed for the bridge. "Whether the system turns out to be a triumph of pleasing creativity or just another big road network is up to many more leaders than just Schaefer alone." [Ahearn, David, "Schaefer Urged to Junk Harbor Tunnel for Bridge," *Baltimore News American*, January 18, 1973]

- California State Highway Engineer Robert J. Datel announced that the State will reexamine proposals and hold public hearings for four freeways in northeast Sacramento County in the vicinity of Carmichael, Fair Oaks, and Citrus Height (Routes 65, 143, 244, and 102). The expressways had been planned 10 years earlier to complete the area's freeway grid. The Mother Lode Chapter of the Sierra Club responded to the announcement by saying, "Seldom have the county's residents had a better chance to determine their own highway destiny. Seldom have state and county agencies declared themselves more responsive to citizens' pressures." ["New Attitude Toward Freeway Planning," *The Sacramento Bee*, January 20, 1973]
- FHWA approved a final draft of an environmental impact statement for the Papago Freeway in Phoenix. The statement, consisting of three 2-inch thick books, addressed criticism from EPA and the Departments of the Interior and Health, Education, and Welfare, as well as citizens groups trying to block the freeway and encourage substitution of mass transit. As alternatives, the document considered mass rapid transit on exclusive rights-of-way, an expanded bus system, widening existing streets, and doing nothing. "It was found that because of diverse travel patterns generated by the current and planned use in the Phoenix urban area, little promise is held for an expanded role for public transit, regardless of form." Despite some "unavoidable environmental effects," the statement concluded, failure to build the freeway, the statement concluded, would leave Phoenix an undesirable place to work and live. [Tragash, Steven, "Impact Report Backs Freeway Despite Faults," *The Phoenix Republic*, January 30, 1973]

Boston, too, was in the mix in January 1973. When Government Sargent announced on November 30, 1972, that he was canceling the remaining Interstates in the Boston area, one expressway was nearing completion. On February 6, 1973, Massachusetts opened 1 mile of a 3-mile elevated section of the I-93 Connector into Boston. Commissioner Sargent had begun construction of this final segment linking Boston to New Hampshire in 1965 at a time when it was designed to link to the Central Artery (I-93), the Northeast Expressway (U.S. 1), and the I-695 Inner Belt. When Governor Sargent imposed a moratorium on Boston freeway construction in 1970, he allowed work on the $100 million I-93 Connector to continue.

As the State prepared to open the connector, *The Wall Street Journal* began an article about the route by saying:

> It's some kind of highway, all right. Eight lanes wide and partially double decked, it sweeps into downtown Boston from the northern suburbs.
>
> But there's one problem. It may be useless . . . . Thanks to some curious political and bureaucratic decisions, however, the highway is missing some key appendages.

> Consequently, it won't mesh properly with the existing roadway in downtown Boston to which it is attached . . . .

The connector would feed four lanes of traffic into an area that already backs up 2 miles or more during peak periods and would introduce a dangerous "weaving" for an exit shortly after the connector merges with the Central Artery. These problems were not contemplated when the highway was designed because the plans included the Inner Belt and the bridge linking Leverett Circle and the Tobin Bridge, both of which would have diverted some I-93 traffic:

> The highway was originally planned along with two other projects—another highway would have drained off a lot of traffic before it reached the busy downtown area and a bridge that would have solved the weave problem. The two additional projects, however, were stalled when, in 1970, Massachusetts Gov. Francis Sargent bowed to antihighway forces and declared a moratorium on highway building within greater Boston.

Critics, including Governor Sargent's political opponents, considered the highway unusable. Suggestions included putting bleachers on it to run the soap box derby, install mobile homes for low- and moderate-income housing, or simply convert it into "the world's longest bowling alley." Fred Salvucci, then Mayor White's transportation advisor, suggested, "Just leave it there as a monument to a mistake." [Gumpert, David, "There's a Swell Road Into Downtown Boston, But Don't Drive on It," *The Wall Street Journal*, January 11, 1973]

Salvucci had a suggestion, all kidding aside, as quoted in *The Boston Globe*:

> Mayor White's transportation adviser, Frederick Salvucci, wants [Secretary of Transportation] Altshuler to consider seriously the idea of depressing the Central Artery in-town. The suggestion first cropped up during the Sargent-ordered [1970] restudy. [Plotkin, A. S., "I-93 No Bowling Alley – At Least in One Direction," *The Boston Globe*, March 18, 1973]

(The first week of July, the State opened the southbound lanes of I-93 to its junction with I-95 – where I-93 motorists encountered a traffic light. It was an interim measure designed to operate as a metering light to regulate traffic flow while FHWA and State officials considered solutions to the traffic problems. ["Stewart, Colin, "Boston's Interstate Red Light—The Expressway Ends," *The Christian Science Monitor*, July 5, 1973]

The battle between the pro- and anti-highway forces in Washington and around the country did not diminish traffic volumes on the Nation's roads. FHWA announced in January 1973 that during the past 4 years, traffic on all roads had increased nearly 25 percent. In 1968, vehicle miles had topped the 1 trillion mile mark for the first time (1,016 billion vehicle miles) and had increased to an estimated 1,250 billion vehicle miles in 1972. "One and one-quarter trillion miles is such a mind-stretching figure that even comparisons are hard to grasp," Acting Administrator Bartelsmeyer was quoted as saying. "It is equal to more than two and one-half million round trips to the moon."

The announcement also reported:

> Passenger cars represented nearly 80 percent of the vehicles and accounted for over 79 percent of the travel . . . .; trucks and truck combinations, 17 percent of all vehicles and 19 percent of all travel; similar figures for buses were less than one-half of 1 percent.

The Interstate System, which contained about 1 percent of total mileage of roads and streets, carried 19 percent of the travel. Overall, roads included in the Federal-aid systems carried 67 percent of the travel. ["1972 Highway Travel Equal to 2 ½ Million Moon Round Trips," *FHWA News*, January 31, 1973, p. 8]

Los Angeles: 20th Century Ghost Town

On January 15, 1973, EPA Administrator Ruckelshaus announced a draft plan for reducing smog in the Los Angeles area in accordance with the Clean Air Amendments of 1970. The legislation required transportation control measures where automobile emission controls and stationary pollution controls (e.g., gas stations) are not enough to reduce pollution. The Los Angeles area exceeded the .08 parts per million of photochemical oxidants in 1970 on at least 150 days.

Ruckelshaus acted reluctantly only after a court ruled that he must. Plaintiffs, including the cities of Riverside and San Bernardino, had petitioned the court to require EPA to submit a plan to meet the national standards under the Clean Air Act in the Los Angeles area. Following the U.S. District Court ruling, Ruckelshaus acted on the final day in the court order.

In announcing the plan, Ruckelshaus told a crowded news conference that "now is not the time for emotional responses, not the time for panic," but he hoped the plan would at minimum "force the public to confront the issue." He acknowledged the area's unique characteristics, saying, "The encircling mountains and frequent inversions hold in pollutants, and the Southern California climate provides ample sunshine to aid the formation of photochemical smog." Given these circumstances, the area's transportation mix was the immediate problem. "The automobile is by far the dominant mode of transportation. For example, in 1972, the South Coast Air Basin contained over 10 million persons and nearly 6 million motor vehicles."

The EPA plan called for reducing automobile use in the Los Angeles area by gas rationing to reduce driving 82 percent during the high smog months (May through October). Options for rationing included issuance of gasoline coupons and restrictions at the retail level. The plan also called for retrofit devices to prevent evaporation from gas tanks and carburetors in cars for model years 1966-1969 and trucks for 1966-67; conversion of all 1971-1974 cars and trucks in fleets of ten or more to low-polluting fuels such as natural gas; and changes for stationary sources, such as vapor recovery systems at gas stations and prevention of evaporation of solvents into the air at dry cleaners. Emission controls and stationary source controls were not enough; they would leave an excess of roughly 270 tons of hydrocarbon effluents daily that could be reduced only by gas rationing.

He knew the plan was drastic:

> Reduction in the mobility of workers and consumers could have a major impact on the economic fabric of the community. Interference with the ability of citizens to move as

> freely [as at present] will alter the life-style of the region . . . . Cost of doing business may rise to an unknown extent.
>
> I am proposing a strategy, but by no means saying we have exhausted all the other means. Other strategies we have not proposed should be examined by the public . . . . We believe that very serious, intelligent investigation of mass transit here in Los Angeles is very important.

EPA, Ruchelshaus said, would hold public hearings on the proposal. The public would have to decide "through the political process" whether mass transit or a change in the law was desirable. He acknowledged that he would have preferred more flexibility under the law:

> If the economic and social dislocation of the people of this community is severe, then their representatives in Congress may see a need for stretching out the time limit in meeting those standards. I don't know if reducing traffic by 80 percent is possible if you're still to have a viable community. It takes something like this to get people to focus on the nature of the problem.

Ruckelshaus was right that the reaction to his proposal would not be favorable. Robert L. Ohass, Los Angeles County's chief air pollution control officer, called it "illogical and impractical." He continued:

> It would be a little like destroying a community to save it. It would shut down the community. It would have a serious impact on all aspects of life. Essentially, it is not a solution.

While modification of the Clean Air Act was desirable, the EPA Administrator cautioned that "if the result [of the proposal] were to convince people that the act itself was a bad act, it would be very unfortunate."

On January 16, Senator Muskie, one of the authors of the Clean Air Amendments of 1970, announced that he planned to reintroduce a version of the Cooper-Muskie amendment. Further, as chairman of the Public Works Committee's Subcommittee on Air and Water Pollution, he would resist an amendment to the enforcement deadline, but an aide thought some adjustment was inevitable. "The Congress has got to know what the full social and economic–as well as environmental–costs of the problem are. But you don't get this input until you have this kind of confrontation."

Senator Tunney, a resident of Riverside, predicted that the plan, if put into effect, would make southern California "a 20th century ghost town." The plan, he said, "fails to recognize that we can have a healthful environment and a prosperous community." He endorsed the stringent deadline, but worried that the EPA plan would give critics an excuse to gut the Clean Air Act. In addition to supporting Senator Muskie's new version of the Cooper-Muskie amendment, Senator Tunney announced he would introduce legislation to use $900 million from the Highway Trust Fund for a 3-year crash program to develop a clean auto engine that he said would solve 80 percent of

Southern California's smog problem. He also advocated using $3 to $4 billion of Highway Trust Fund revenue to construct a bus-and-rail transit system in the area by 1980.

Representative Glenn Anderson announced that EPA's plan "borders on negligence" because it did not offer "an attractive, inexpensive, efficient transportation alternative." Gas rationing "would encourage a black market that would make Saigon look like Disneyland" while permitting gas station operators just beyond the region to reap large profits. He said he would renew his fight to allow Highway Trust Fund revenues to be used for mass transit. [Aarons, Leroy R. "Rationed Gas Proposed for Autos in L.A.," *The Washington Post*, January 16, 1973; Lydon, Christopher, "Muskie Urges Mass Transit Aid in Light of Proposed Auto Curb," *The New York Times*, January 17, 1973; Houston, Paul, "Tunney Urges Use of Highway Fund for Car Research," *The Los Angeles Times*, January 18, 1973]

What was not evident at the time of Ruckelshaus's announcement was that freeway building in California had passed its peak years, as explained by David W. Jones, Jr., of the Institute of Transportation Studies, University of California, Berkeley:

> The year 1967 was the high watermark of California's freeway era. The Interstate program was in its tenth year and nearing its peak. The manpower of the Division of Highways stood at 9,000 engineers—up from 6,000 a decade earlier. The Highway Commission was aggressively certifying routes for freeway construction, and right-of-way expenditures were at an all-time high.
>
> The Division of Highways was geared up for mass production and was building freeways at an extraordinary pace. It built 225 miles of freeway in 1965, 264 miles in 1966, and then 328 miles in 1967. But 1967 was to prove the peak.
>
> Freeway production sagged after 1967, was restored briefly, and then collapsed after 1970 . . . .

Freeway completion totaled 276 miles in 1970, 182 miles in 1971, 236 miles in 1972, 146 miles in 1973, and 88 miles in 1974 – the highest total for the remaining decade:

> [I]nflation was the proximate cause of retrenchment. But the underlying cause was political as well as fiscal: Inflation was allowed to dismantle the highway program because other priorities had moved to the fore.

As for inflation, "real dollar expenditures were quartered from 1970 to 1976." This reduction in buying power was worsened by fiscal stringency:

> Thus, the early seventies were the mirror image of the late fifties. In the late fifties, the Interstate windfall had enabled the Division of Highways to gear up for mass production. In the seventies, fiscal stringency dictated equally rapid retrenchment.

The gas tax was part of the problem:

> Through the sixties, the fuel tax was the locomotive of the freeway program. But in the seventies, it became a liability rather than an asset. This is because fuel taxes have no built-in mechanism to adjust for inflation, and because fuel tax collections were depressed by the set of events that came to be known as "the energy crisis."

Another factor in the "cost-revenue squeeze" was what Jones called "the inflation of project concepts." He said that "freeway projects became progressively larger and more complex as traffic became heavier and heavier." The result of "upscoping" was a significant project cost increase.

Governor Reagan was another factor in the retrenchment:

> The governor's cornerstone policy was that the State must live within its means, and Reagan instructed his highway department to make do with diminished resources.
>
> There was a brief debate within the Governor's office over the special circumstances created by the idiosyncrasies of the gas tax, but the Governor personally rejected this argument. Reagan insisted that the Division of Highways make the adjustments in program necessary to balance its budget. In the years immediately following, revenues declined sharply, forcing the State to abandon land banking and advance route determination.

His successor, Governor Jerry Brown (1975-1983, 2011-) accelerated the retrenchment:

> Governor Jerry Brown took outspoken positions on environmental issues and appointed a conservation-minded planner as his Director of Transportation. The Governor argued that the "Era of Limits" was appropriate for the highway program, and Transportation Secretary Adriana Gianturco echoed this view.
>
> Gianturco's outspoken environmentalism and her knack for stirring up public controversy personalized and polarized the policy debates of the late seventies. And, as a result, it is widely perceived that retrenchment began with the Brown Administration and that it was its willful policy. A more accurate statement is that retrenchment accelerated during the Brown Administration, and was allowed to run its course.

At the time, the Division of Highways was working from the Freeway and Expressway Plan approved in 1959. Jones summarized the central premise behind the 1959 plan:

> The congestion could and should be kept at bay by building successive generations of parallel freeways. This was the plan's intellectual core, and the operative premise of the freeway program in metropolitan California. Outmoded by the events of the seventies, the commitment to parallel facilities was gradually abandoned in the eighties—not formally, not explicitly but nonetheless decisively.

The plan also had been approved on a key assumption, namely continuation of "the funding level that prevailed during the Interstate build-up and its implementation required a sustained program of continuing investment." That expectation turned out not to be the case. [Jones, Jr., David W., *California's Freeway Era in Historical Perspective*, Institute of Transportation Studies, University of California, Berkeley, for the California Department of Transportation, June 1989, p. 309-320]

(Gianturco, as Jones noted, was controversial. She had been director of planning for the Massachusetts Office of State Planning and Management from 1973 until she became Assistant Secretary of California's Business and Transportation Agency in the fall of 1975. Governor Brown nominated her to become director of the California Department of Transportation in early 1976, and she was quickly branded as anti-freeway. While awaiting confirmation from a skeptical State Senate, she told reporters, "I think the highway system is going to remain the most important element of the transportation system in the foreseeable future," adding, "My approach is for balanced transportation." She explained that "different solutions are appropriate in different situations. In heavily settled areas mass transit may be a better way to move people around." She had mixed feelings about "heavy-rail" solutions such as BART. "I would tend to favor less expensive, more flexible systems," such as heavier use of buses. ["Caltrans Chief Outlines Goals," Associated Press, *The Los Angeles Herald-Examiner*, March 30, 1976]

(She was immediately blamed for the Santa Monica Freeway (I-10) Diamond Lanes (concurrent-flow preferential lanes for buses and carpools) that had been planned during Governor Reagan's term, but went into effect on March 15, 1976, as she took office. When the Diamond Lanes turned the general traffic lanes into "parking lots," Gianturco was vilified as "Giant Turkey," "the Madwoman of Caltrans," and "Our Lady of the Diamond Lane." The Diamond Lanes came to an end 21 weeks later when the U.S. District Court ruled against the project. In an interview years later, she recalled that she was "besieged, vilified, crucified" over the Diamond Lanes. She added that, "The freeway fiasco lasted only five months; I stayed in that job for (nearly) seven years," but she would never overcome that initial image as "an arrogant, power-crazed madwoman." [Bettijane Levine, "A Driven Woman: Adriana Gianturco Fought a Lonely Battle for Car-Pool Lanes in 1976. Now, They're Part of the L.A. Map," *The Los Angeles Times*, February 22, 1994])

The impact of the Clean Air Amendments of 1970 was being felt around the country. On February 5, 1973, the Southern California RTD announced a $5 million bus service improvement program and a shift away from rapid transit planning. Gas tax revenue earmarked for rapid transit would be shifted to expanding the district's 1,500-plus bus network. The district hoped to gain support for using General Revenue Sharing funds to maintain a flat 30-cent fare anywhere in Los Angeles County. Alternatively, revenue sharing could be used for a $140 million "saturation" bus system. The RTD's general manager, Jack R. Gilstrap, explained that sufficient revenue was not available to finance a high-capacity rapid transit system, or even to start such a system. [Hebert, Ray, "Transit Officials Stress Improved Bus System," *The Los Angeles Times*, February 6, 1973]

Transportation planners in San Diego wanted to eliminate the automobile from downtown and replace it with "people movers" that would carry people in electric-powered, one-car vehicles on an elevated concrete track. They would link peripheral parking garages with downtown street corners. City streets would be for pedestrians only. Such a system was in operation at the University of West Virginia in Morgantown, with Federal funding help. Planners thought riders might even be able to use the system for free if developers would contribute to the cost or if expenses could be paid out of the gasoline tax. The city had submitted an application to the Department of

Transportation. [Associated Press, "Downtown San Diego Planning its Farewell to the Automobile," *The Baltimore Sun*, February 7, 1973]

California also was developing an ambitious expansion of bikeways. In October 1972, the Department of Water Resources had opened the first 67-mile section of a 444-mile bikeway on the California Aqueduct's 20-foot-wide service road. The initial section stretched from Bethany Reservoir near Tracy to San Luis Dam near Los Banos. In Marin County, a 24-mile bicycle route system ran through the county and crosses the Golden Gate Bridge to connect with bikeways in San Francisco. The State had passed legislation requiring the State Department of Public Works' Division of Highways to spend a minimum of $360,000 in highway funds each year for bikeways. The Highway Division already was converting older roads to bikeways after they were replaced by newer facilities.

The bicycle was still far behind the automobile as a mode of transportation. Peter M. Flanagan, a presidential assistant, had said that even as the energy crisis grew, "The United States is not going back to the cold, the dark, and the bicycle." Nevertheless, with at least 60 million bicycles in use nationally, efforts were underway to give them greater prominence. ["Bikeways Spread on Coast as More Take to Cycling," *The New York Times*, January 28, 1973]

In Richmond, the Virginia Air Pollution Control Board proposed gasoline rationing to reduce pollution levels in northern Virginia. Such a proposal would have to be coordinated with Maryland and the District of Columbia through the Metropolitan Washington Council of Governments (COG). On January 24, COG had proposed a series of controversial measures to reduce pollution, but not including gasoline rationing. Proposals by COG included a $2 a day surcharge on all-day parking in commercial facilities; banning daytime truck deliveries; abolishing free and low-cost parking for government employees and private industry, as well as improved bus service, incentives for carpooling, and completion of the Metro rapid rail system. ["Gas Rationing Urged for Area," *Washington Star-News*, February 7, 1971]

The Opening Salvo

On January 18, Senator Muskie introduced three bills that collectively would divert $1.8 billion a year from highway construction for 2 years. In introductory comments, he said that the failure to adopt legislation in 1972 "should not overshadow the historic significance" of the Cooper-Muskie amendment because by adopting it, the Senate "served notice that the highway trust fund is too narrowly focused to serve today's transportation needs." Since a national transportation policy was a critical element of a national growth policy, the 93rd Congress "must seek ways in which we can all move freely about, without endangering our health, destroying our communities, and wasting our resources in the process."

He considered his first bill, which was a revised version of the Cooper-Muskie amendment, "the cornerstone of a new transportation policy for America." It corrected "the most glaring flaw" in the current policy, namely the "closed circle of Federal funding which perpetuates highway construction as virtually the only solution to transportation problems that most cities and States can afford to choose." The revised amendment increased Federal-aid urban funding to $1 billion a year (from $800 million) and allowed the funds to be used for capital projects to improve ground transportation, including rail mass transit facilities and equipment. Other Federal-aid funds, including Interstate funds, could be used for highway-related public transportation improvements, excluding rail.

The second bill, the Highway Act Amendments to Provide Motor Vehicle Emission Programs (S. 738) required the States to establish annual inspection programs for auto emission control devices. An estimated $350 million a year from the Highway Trust Fund would reimburse the States for the inspection programs.

The most controversial bill was the Highway Act Amendments to Allow Transfer of Funds in Air-Impacted Urbanized Areas from Highway Programs to Other Programs to Improve Transportation (S. 739). It allowed the Secretary of Transportation to use up to 10 percent of annual Highway Trust Fund revenues for emergency programs to develop or improve transportation systems in the 28 urban areas in 18 States that EPA had indicated would not be able to meet the 1977 clean air deadline. The bill would prohibit approval of new highway projects that might raise pollution to levels that would jeopardize public health. It also would allow highway funds to be shifted to public transportation in cities with high pollution levels.

Beyond the three measures, he encouraged Senator Randolph to consider additional provisions in the new Federal-Aid Highway Act, including a special program to focus on the highway needs of urban areas of less than 50,000. He continued:

> It should give Governors the program direction authority now given to State highway departments. It should finance the separation of highway-railway grade crossings from the highway trust fund. And, finally, a new bill should give local governments increased authority to make transportation decisions through an allocation formula for regularly apportioned urban system funds.

In support of his three measures, Senator Muskie explained that each year, "the circle closes tighter as the problems multiply." Whatever the problem, he said, "more highways and more cars have become the only answer—even when they are obviously not the right answer." The automobile had "revolutionized life in America," but now it threatened "to degrade the quality of life." He continued:

> Highways and automobiles have had as destructive an effect on our cities themselves as they have had on the health of the people who live in those cities. Highway construction divides our urban areas with ribbons of concrete—separating people from their jobs and from each other, destroying the integrity of communities, and encouraging suburban sprawl and other questionable land uses . . . . . The senseless construction of urban freeways has run roughshod over the real transportation needs of city residents . . . . In the process of destroying the environment, threatening our health and ravaging our cities, highways and automobiles are also helping to lead us to an energy crisis from which there may be no road back . . . .

> With great ingenuity, productivity, and activity, we have created the present mess. I am convinced that with an equal amount of ingenuity, productivity, and activity, we can reverse it—and create a sensible national transportation policy. [*Congressional Record-Senate*, January 18, 1973, p. 1527-1531]

Each of the bills was expected to encounter opposition from pro-highway Members of Congress. However, Senator Muskie thought that the drastic steps announced to combat air pollution in southern California had dramatized the need for mass transit alternatives to the motor vehicle. [Kenworthy, E. W., "Muskie Will Seek to Tap Road Fund," *The New York Times*, January 18, 1973]

On January 23, Senators Bentsen, Randolph, and other members of the Committee on Public Works introduced S. 502, the Federal-Aid Highway Act of 1973. It authorized $3.25 billion a year through FY 1979 and $257 million for FY 1980 to complete the Interstate System. It also authorized Interstate fund apportionments based on the 1972 Interstate Cost Estimate and extended the completion due date to June 30, 1980 (from June 30, 1976).

The bill included a declaration of policy that the Secretary should carry out the Federal-aid highway program "in such a manner as to give the highest priority in all instances, to highway safety and the saving of human lives." The companion Highway Safety Act, however, was not included with the January 23 bill (it would be introduced on February 19).

In addition, the bill would:

- Establish a national policy to "encourage the minimization of paperwork and interagency decision procedures" and make "the best use of available manpower and funds so as to prevent needless duplication and unnecessary delays at all levels of government."
- Provide for transfer of Interstate mileage upon the joint request of a State Governor and the local governments concerned if the Secretary determines that the segment is not essential to completion of a unified and connected Interstate System and that the State does not plan to build a toll road in the corridor. The mileage would then be available for designation of another Interstate route that was considered essential for connectivity
- Remove from designation on July 1, 1973, any Interstate segment for which the State has not provided assurances of its construction. Prior to July 1, 1974, the State may substitute an alternative segment that meets Interstate requirements. Any segment should be removed from designation on July 1, 1974, unless the State has provided a schedule for construction within the period of fund availability. (These provisions did not apply to Interstate segments designated under the 1,500-mile extension authorized in 1968.)
- Authorized funds from the Highway Trust Fund for the Federal-aid systems, Forest Highways, Public Lands Highways, and Parkways. Also authorized general Treasury funds for forest development roads and trails, public lands development roads and trails, park roads and trails, and Indian Reservation Roads.
- Federal-aid urban funds would be made available to metropolitan planning organizations (MPOs) to carry out projects if the MPO "has adequate powers and is suitably equipped and organized to carry out projects on the urban system."

- Federal-aid urban funds could be used for construction of facilities "to serve bus and other public mass transportation passengers, and for the purchase of passenger equipment other than rolling stock for fixed rail."
- Federal-aid highway funds could be used for the construction of separate or preferential bicycle lanes or paths and other bicycle-related facilities as well as pedestrian walkways and equestrian trails in conjunction or connection with Federal-aid highways. No motorized vehicles would be permitted on these facilities except for maintenance purposes.
- Authorized $50 million a year for the Special Urban High Density Traffic Program for the construction of highways connected to the Interstate System in urban areas.
- Based on guidelines issued by the Secretary, a State may submit a certification that it has processes for carrying out Federal-aid highway construction responsibilities. The certification, if approved, would allow the Secretary to discharge his responsibility for project approvals, other than to oversee the procedures to be sure they are satisfied. The Secretary could not approve certification if he concluded that the procedures will not satisfy the social, environmental, and economic objectives of Federal requirements. To protect the rights of aggrieved parties, the provision allowed for suits under Section 5 of the Administrative Procedures Act to be heard in an administrative hearing regarding a State's failure to comply with its certification.
- Funds for Forest Highways and park roads and trails could be used for adjacent vehicular parking areas, related facilities, and the purchase of buses to provide interpretive [sic] or shuttle transportation services as an alternative means of transportation.
- Authorized the Secretary of the Interior to develop the Highland Scenic Highway as a parkway from West Virginia Route 39 to U.S. 250 near Barton Knob.
- Provided for reconstruction of the Alaska Highway and the Haines Cutoff in Canada.
- Requested reports by January 1, 1975, on the feasibility and necessity of constructing six specified routes, including extension of I-70 from Cove Fort, Utah, to serve Ely and Carson City, Nevada, to Interstate standards for purposes of including them in the Interstate System.
- Severed the contractual relationship between the Federal and State Governments for the San Antonio North Expressway between I-35 and I-410. It would cease to be a Federal-aid project. Texas must repay Federal-aid funds used to develop the expressway.
- Called for demonstration projects to relocate railroad lines from the central area of Lincoln, Nebraska, and Elko, Nevada.
- The Secretary is to report to Congress by January 1, 1975, on the feasibility of establishing a national system of scenic highways linking recreational, historical, scientific, and other similar areas of scenic interest and importance.
- Authorized $20 million a year for a 2-year Rural Highway Public Transportation Demonstration Program to encourage development, improvement, and use of public mass transportation systems operating vehicles on highways to enhance access to employment, health care, retail centers, education, and public services.

On January 23, Senator Baker introduced Senate Concurrent Resolution 6. It authorized the Secretary of Transportation to apportion Interstate funds to the States based on the 1972 Interstate Cost Estimate. If adopted, the resolution would address the problem created when Congress failed to approve the Federal-Aid Highway Act of 1972. The 1970 Act had authorized Interstate construction funds through FY 1976, but without approval to use the 1972 Interstate Cost Estimate, the Department did not have the legal authority to apportion additional Interstate funds. Early passage would allow States to proceed with Interstate projects using funds already authorized while Congress completed work on the new Federal-aid authorization legislation.

(A concurrent resolution is usually initiated on matters affecting the operations of both Houses of Congress. They are not equivalent to a bill and are not submitted to the President for approval. Instead, they normally are used to express facts, principles, opinions, and purposes. According to a 1974 guide to congressional actions, the Clerk of the House and Secretary of the Senate would transmit approved concurrent resolutions to the Administrator of General Services for publication in a special part of the Statutes at Large. [*How Our Laws Are Made*, Government Printing Office, Stock No. 5271-00424, 1974, p. 8-9])

The committee announced that it would begin hearings on February 7.

Engineering News-Record saw the expected battle in Congress shaping up as a repeat of the unsuccessful struggle in 1972. The committee bill was similar to the 1972 version of the bill, but did not allow the use of Highway Trust Fund revenue for non-highway related transit facilities. It authorized $650 million a year for the Federal-aid primary system and $350 million for secondary highways. Urban extensions of primary and secondary highways would be funded at $350 million a year. One difference was that the authorization for the Federal-aid urban system was cut to $650 million, with all of it available for highway-oriented mass transit. (The 1972 bill authorized $800 million a year for the urban system, but required $300 million to be used for bus transit.)

Henrik E. Stafseth, AASHO's new executive secretary, said:

> Congress is reacting by just getting a bill into the hopper as soon as possible. The fastest way to do this is by using last year's bill. ["Fight on New Highway Act is Repeat of '72," *Engineering News-Record*, January 25, 1973, p. 24]

In discussing the pending battle, an editorial in *The New York Times* emphasized the significance of the Los Angeles clean air plan. It gave "dramatic force" to the familiar arguments of critics that "major highways in cities and suburbs often disrupt neighborhoods, invade parks, obliterate historical landmarks, and usually intensify the traffic congestion they are designed to relive." The editorial endorsed Senator Muskie's bills. "Before gas masks and gas rationing become the order of the day, it is time for Congress and the Department of Transportation to draw up the plans and take the action to meet a rapidly developing emergency." ["Coming Up For Air," *The New York Times*, January 27, 1973]

On January 31, 1973, Senators Kennedy and Weicker introduced the Highways and Related Transportation Systems Improvement Act of 1973. Under the bill, 90 percent of non-Interstate funds would be apportioned to the States. Half of this amount would be administered by the State Governors, and the other half passed through by the Governors directly to local governments in the metropolitan areas where some 73 percent of citizens reside. The non-Interstate funds could be used for highways, as at present, or for acquisition, construction, improvement, operation, or maintenance of public transportation systems, including rail transit.

The remaining 10 percent of non-Interstate funds would be available to the Secretary of Transportation for discretionary use to help urban areas meet the ambient air quality standards of the Clean Air Act and emergency relief programs in the event of a natural disaster.

For the funds apportioned to the States, the Governors would use their portion and pass through the urban share based on population. The bill required comprehensive planning at the State and urban area levels with the objective being "the solution of transportation problems with a combination of roads, rail, and buses that makes the most sense." Comprehensive plans were not possible, Senator Kennedy said, "when adequate funding existed only for the construction of highways." Without sufficient funding, "transportation planning will remain an empty exercise for planners."

The Governor must approve the State plan and submit it to the Secretary of Transportation for approval. The Secretary may approve it only if the State considered "social, environmental, and economic impacts of various mixes of transportation modes for solving transportation problems."

Senator Kennedy explained that by approving the Cooper-Muskie amendment in 1972, the Senate had "finally blasted the first crack in the transportation ethos that more highways are the only answer to our transportation needs." He continued:

> Now it is time to extend that recognition to the Congress as a whole and to permanently change the highway trust fund from a federal conduit for concrete into a sensible national mechanism to finance transportation solutions—whether they call for mass rail transit, buses, intercity rail or essential highways.

Now was the time, he said, because of "the transportation crisis that now exists." He summarized the problems stemming from "a free-flowing Federal spigot that has poured out more than $53 billion for the past 16 years" for highways: "too many cars and trucks in urban areas, severe decay of the environment and financial distress in key segments of the transport industry." The "failure to examine the concrete dream that has produced federally financed highways that are laden with air pollution" was given renewed emphasis by EPA Administrator Ruckelshaus's proposed rationing of gasoline consumption in the Los Angeles area. "A major city is being told to kick its autos off the streets if it wants to assure an adequate supply of clean air to its citizens." He emphasized the larger point:

> While Los Angeles may be unique in its geographical and meteorological characteristics, the essential element remains: almost total reliance on highways and the automobile to meet transportation requirements has produced a host of environmental, social, and economic disasters in its wake.

In addition to authorizing $3.25 billion for Interstate construction for each of the next 6 years, the bill required a review of remaining Interstate routes and a halt of those in urban areas where cities and States concurred. The funds for withdrawn routes could be used in the area for transportation projects, including mass rail transit. The substitute plan would require continuation of the Interstate System around a city via a bypass or beltway. Senator Kennedy explained that these provisions were particularly critical because $17.5 billion of the $30.7 billion remaining cost of completion involved urban Interstate segments that "often carry unacceptable environmental, social and economic consequences in their wake." He cited his home State as an example:

> Thus, in Boston, after a 33-month exhaustive study, the Governor concluded that it was in the public interest to put a permanent moratorium on interstate routes planned through the Boston metropolitan area. Instead, he opted, and wisely I believe, for a plan that concentrated on mass transit. Highways still will be constructed, but not through urban neighborhoods or scarce parklands or historic sites.
>
> Similar actions appear likely in a host of other cities where routes have been stalled by citizen and court actions.
>
> In all of these areas, present law prohibits money allocated for highway routes to be used for any other purpose. If it is not used to complete the original route, then it is reallocated to another area. Nor is the bill introduced by the committee an adequate answer since it still prohibits a single dollar of those funds from being used for mass rail transit.
>
> Our bill would remedy this flaw, permitting the completing of an interstate network and at the same time promoting urban transportation solutions.

Senator Kennedy said that unlike the 1972 version, the new bill did not mandate the formation of metropolitan transportation agencies. It did, however, strengthen and encourage them by providing that in the new planning process, elected officials and citizens would be involved from the inception of the plan. "Elected authorities would participate in the management of the planning agency and they would have voting power proportional to their population."

This shift was the key because "it provides flexibility to local and State decisionmakers on how to meet their transportation needs and it assures adequate funds to permit the creation of a balanced transportation system." The bill did not mandate more mass transit and fewer highways, but for the first time, "it does not distort the planning process by tempting financially pressed cities and States with Federal dollars for highways and virtually nothing for any other transportation programs."

In drafting the planning section of the bill, Senator Kennedy said, "The critical issue to be decided is whether we will give the mayors and the governors new options to enable them to meet these problems." The bill tried to separate State highway officials from transportation decisionmaking. Elected Governors and elected local officials, the Senators reasoned, "have the best understanding of the transportation priorities of their regions." In short, they were more likely to be responsive to citizen/voter demands for alternative transportation modes than unelected highway officials who saw highways as the solution to most transportation problems.

Senator Kennedy introduced the bill, designated S. 679, as well as articles on "the transportation crisis." The reprints included articles about the EPA plan for the Los Angeles area, William Shannon's *Times* article "The Untrustworthy Highway Fund," a statement by Theodore Kheel ("The

Fight for a Transportation System That Works"), a piece by Ben Kelley ("The Highway Lobby—Congestion and Pollution"), newspaper articles about the difficulties confronting mass transit, and an article by Senator Kennedy called "Our Nationwide Transportation Mess."

Senator Weicker emphasized that the bill did not interfere with Interstate construction funding. "The important distinction is the treatment of an estimated $2.75 billion allocated for noninterstate funding." The bill simply gave State and local officials a new option for the use of this funding on rail or bus transit. Further, funding for these areas would go directly to metropolitan areas under a pass-through provision based on each city's size:

> The overall intent of these pass-through provision is to stimulate transportation planning in urban areas at the local level. And, in fact, money becomes available under the passthrough [sic] only when a city or agency has a comprehensive transportation plan approved by the Secretary of Transportation and the Governor.

He called the new bill "the most progressive and appropriate plan for applying our Highway Trust Fund to the transportation needs of America." He continued:

> Highways were our first priority when the trust fund was set up in 1956. But the building of highways became a national obsession—and this obsession has caused what can only be described as "the great American motion sickness."
>
> Our transportation system has become an indifferent, inefficient, destructive, and deadly "beast of national burden" . . . . What we are now saying to the Congress is that the highway trust fund is no more sacrosanct than any other federal project, regardless of what it is called . . . . [The] highway lobby in Washington has fought a vigorous battle to protect "its" fund. Arrogantly they claim to speak for all Americans, and unfortunately most Americans are too lazy to face them down.

Because the problem "has been a creeping rather than instantaneous disaster," people sat in their cars and grumbled while accepting "the traffic jams, the death, the pollution, the environmental desecration." He repeated the parable he had used in 1972 about cooking a frog, concluding as he had then, "In terms of transportation, we are the frog and we had better jump or - " [*Congressional Record-Senate*, January 31, 1973, p. 2688-2705, statement ended as shown]

President Nixon was continuing to impound funds as part of his plan for economic stabilization. In early February, the White House announced that it was holding $8.7 billion in "reserve." The largest item in the list of impoundments was $2.5 billion in Federal-aid highway funds that were being withheld to "help maintain economic stability without undue price and cost increases." Other transportation impoundments included $20 million in urban mass transit projects, $207 million in FAA air facilities construction, and $50 million in National Park Service road construction.

The President had defended impoundments during a January 31 news conference.

> Q. Mr. President, how do you respond to criticism that your impoundment of funds abrogates power or authority that the Constitution gave to Congress?
> A. The same way that Jefferson did, and Jackson did, and Truman did . . . . The constitutional right for the President of the United States to impound funds—and that is not to spend money, when the spending of money would mean either increasing prices or increasing taxes for all the people—that right is absolutely clear.

He acknowledged that Congress wanted responsibility for funding decisions:

> Believe me, it would be pleasant to have more sharing of responsibility by the Congress. But if you are going to have responsibility, you have to be responsible, and this Congress . . . has not been responsible on money.

He had checked the campaigns of every Member of Congress, he said, and reported that "I didn't find one Member of Congress, liberal or conservative, who had campaigned on the platform of raising taxes in order that we could spend more." Congress had to choose whether to raise taxes or cut programs. That was difficult for Members of Congress because they often represented special interests. The President was the one person who spoke for the general interest, not the special interests:

> Therefore, I will not spend money if the Congress overspends, and I will not be for programs that will raises the taxes and put a bigger burden on the already overburdened American taxpayer.

Deputy Attorney General Joseph Sneed testified before the Senate Judiciary Committee's Subcommittee on Constitutional Rights that precedent and the Constitution upheld the President's right to impound. Senator Ervin, chairman of the subcommittee, replied, "Every generation has its murderers and thieves, but that doesn't make murder meritorious or larceny legal." ["Congress Challenges Nixon Budget Priorities," *Engineering News-Record*, February 15, 1973, p. 12]

On the eve of appearing before the renamed Senate Subcommittee on Transportation, Secretary Brinegar announced that he was abolishing the post of Assistant Secretary for Environmental and Urban Systems, the post once held by former Seattle Mayor Braman, and creating a position for an Assistant Secretary to handle congressional relations, which Secretary Volpe had handled himself. John E. Hirten, an architect and urban planner who had held the environmental position since July 1971, would become an Assistant to the Secretary, while his former duties would be spread among other Assistant Secretaries.

For the new post of Assistant Secretary for Congressional and Intergovernmental Affairs, Brinegar selected Robert T. Monagan, a former Republican leader in the California State Assembly. In the State Assembly, he had voted regularly to use part of the State's gas tax for mass transit. According to unnamed Department sources, Brinegar concluded that the veteran politician Monagan would be more effective at lobbying Congress than the politically inexperienced Secretary. [Braestrup, Peter, "New DOT Job Seen Going to Monagan," *The Washington Post*, February 6, 1973]

Hearings Get Underway

The Subcommittee on Transportation of the Senate's Public Works Committee began hearings on its bill, S. 502, on February 7. The Department of Transportation had not yet completed its legislative proposal, but Secretary Brinegar would be one of the witnesses on this first day.

Chairman Bentsen began by summarizing the failure of the Federal-Aid Highway Act of 1972 after the House and Senate had reached agreement on the final day of the 92nd Congress. The Federal-aid highway program could continue through the end of FY 1973 (June 30, 1973), "but many States, including my own, are rapidly depleting their resources for continued highway upgrading and development." States were uncertain whether to program projects for FY 1974, but "I do not believe we would serve our cause or the Nation's by rushing this measure through without a thorough examination of the issues involved." He would not, he said, "sacrifice responsible highway legislation in the name of expediency.

To ensure a balanced and comprehensive view, he had scheduled nearly 40 witnesses "from all walks of life" to discuss the serious questions before the subcommittee:

> I have directed the various witnesses to address themselves to the most difficult and controversial issues confronting us, including, the proper authorization levels for the various Federal-aid programs, interstate, primary, secondary, and urban; the value of retaining the various categorical programs as opposed to encompassing them under three or four general headings; the use of highway trust funds for public transportation purposes, including rail transit; the so-called "pass through" of highway funds to urban areas, bypassing the States; the transfer of interstate mileage and the substitution of alternative segments by the States; and the advisability of the so-called "priority primary" system in last year's House bill, which would have authorized a new 10,000-mile system to approximate interstate standards using selected, heavily traveled roads.

He acknowledged that S. 502 contained $500 million less from the Highway Trust Fund and the general fund than the bill the Senate passed in 1972. The total still represented "a substantial investment for highways and highway related purposes," but he recognized "that the needs in these areas must be viewed in light of our efforts to contain inflation and offer reductions in Government spending."

The day before, February 6, a school bus collision with a train in his home State of Texas had killed seven children and injured several others. This tragedy in Littlefield dramatized "the serious national problems of highway safety in the United States." He said he would introduce a comprehensive highway safety bill in a few weeks. [*Federal-Aid Highway Act of 1973*, S. 502, Hearings, Subcommittee on Transportation, Committee on Public Works, United States Senate, 1st Session, 93rd Congress, Serial No. 93-H2, Government Printing Office, 1973, p. 1-3]

(According to a contemporary AP account, a Santa Fe freight train slammed into the rear of the school bus at a speed of 58 mph. Red signal lights at the rail-highway crossing were working. Seven children were killed, including two sets of brothers and sisters. Seventeen were injured, including the bus driver. [Associated Press, "7 Killed in School Bus Crash," *The Daily Register*, Red Bank, New Jersey, February 7, 1973]),

Senator Bentsen introduced Senator Randolph, who acknowledged that, "We are in a period of change, perhaps even more important, a period of challenge." In addition to the usual issues involved in any Federal-Aid Highway Act, he said the subcommittee faced "the overriding controversy of the relationship of the highway program to mass transit." He wanted to listen to all voices, but his view was clear:

> I believe highway funds can and should be used to strengthen public transportation systems that are oriented to the use of highways. This is the type of public transportation on which most American communities depend, and it is the type that can be expanded, realistically expanded, rather quickly to meet situations that we have in certain areas of our country.

He would continue to support funding for mass transit from sources other than the Highway Trust Fund, but said that "we have a job to do, the completion of the Interstate System and the improvement of other roads."

He pointed out that Congress had created a second trust fund for airports and airways rather than tapping the Highway Trust Fund. Now, the Senate was considering additional funding for airports and airways complexes. "There was no effort made to amend that legislation . . . to divert that money from the airport and airways trust fund for mass or urban or rail transit." As this example suggested, "I believe that we will find if we are diligent, ways in which we can fund mass transit from other sources, Mr. Chairman, rather than to deplete the highway trust funds, and set in motion a deterioration of this worthwhile effort." [*Federal-Aid Highway Act of 1973, S. 502*, p. 68-69]

Senator Baker discussed Senate Concurrent Resolution 6:

> This measure would provide the Secretary of Transportation the authority to apportion Interstate System funds for 1974, so that while Congress debates the greater issues, the States will not lose the spring construction season for the Interstate System. This, I believe, is very important.

He emphasized the importance of the subcommittee's first task in providing for completion of the Interstate System "as quickly as possible." He continued:

> Second, provide for an orderly, intelligent, attractive system of urban mass transit for the United States of America, and third, begin to decide the future of the highway program, and its relation to a unified transportation system. [*Federal-Aid Highway Act of 1973, S. 502*, p. 70-72]

Next, Senator Muskie introduced his three measures. He said that when the Senate approved the Cooper-Muskie amendment in 1972, "it was clear that a more flexible and more sensible transportation policy was a necessary step in securing for us the benefits of growth without making us its victims." His revised version of the amendment "would correct the most glaring flaw in our present transportation—a closed circle of Federal funding which perpetuates highway construction as virtually the only solution to transportation problems that most cities and States can afford to choose."

After summarizing his two other bills, he said:

> The automobile has revolutionized life in America, but now, it threatens in many ways to degrade the quality of life in America. Highways and the cars that use them pollute the air and menace our health, transform and degrade the urban environment, inefficiently consume our resources, and distort our transportation priorities.
>
> The costs of air pollution take the highest toll among the residents of our Nation's great cities, where motor vehicle emissions account for upward of 80 percent of urban air pollution . . . .
>
> Highways and automobiles have had as destructive an effect on our cities themselves as they have had on the health of the people who live in those cities. Highway construction divides our urban areas into ribbons of concrete, separating people from their jobs and from each other, destroying the integrity of communities, and encouraging suburban sprawl and other questionable land uses. The senseless construction of urban freeways has run roughshod over the real transportation needs of city residents, displacing hundreds of thousands of people and businesses in the process.

They also were leading the Nation into "an energy crisis from which there may be no road back." Motor vehicles used 40 percent of all petroleum consumed in the United States, with 55 percent of that share devoted to private cars. "In light of an impending energy and fuels crisis, this waste is unacceptable; but as long as automobiles remain our principal mode of urban transportation, that reckless consumption of dwindling supplies of fuel will continue unchecked."

Clearly, he said, "Americans are paying a heavy price for the luxury and convenience of private automobile transportation." Many Americans who paid the price got nothing in return. "For these Americans, the highway trust fund and the transportation system it creates rob Peter to pay Paul." Urban Americans without a car did not have the mobility "to gain access to adequate education, health care, job opportunities, and other necessities . . . ."

The Highway Trust Fund, he said, perpetuated these "inequities and imbalanced transportation priorities," and the time for change was now. His three measures "will not provide automatically the ingenious new transportation systems we need nor quick public acceptance of mass transportation as a substitute for the luxury and convenience of the private automobile." However, diversion of Highway Trust Fund revenue "must come first, both to signify our willingness to change and to make it financially possible to do so."

In closing, he cited the I-93 Connector in Boston and asked the subcommittee to reprint an article from *Newsweek* called "Boston—The Road to Nowhere" (the issue of February 12, 1973) that cited the nicknames that "disgruntled city fathers and private citizens alike" call the new connector: "that stupid thing," "the road that goes nowhere," and "the $100 million misunderstanding." Far from relieving traffic jams, opening the road "will almost certainly make them worse—and a good deal more dangerous." The highway was, the article said, "an idea whose time has gone," and explained that when Governor Sargent imposed his moratorium, the I-93 Connector was excepted because "with $60 million invested in the project and 90 per cent Federal financing guaranteed for the remaining cost, it was cheaper for the state to finish the job than call if off."

Senator Muskie concluded:

> This road to nowhere epitomizes the ridiculous misallocation of spending priorities which the current highway program fosters, and which I hope this year's highway legislation will find a way to correct. [*Federal-Aid Highway Act of 1973, S. 502*, p. 73-74, 94-95]

Secretary Brinegar's Busy Day: A.M.

Secretary Brinegar was the first witness. He began by saying that since his confirmation hearing, he had spent "a substantial amount of time" studying existing programs and the proposals from 1972 to formulate current policy. He did not consider himself "a 30-day expert on all aspects of this important program," but he had done his homework and was prepared to discuss the issues.

In view of the disruption caused by failure to pass the Federal-Aid Highway Act of 1972, he said that the Administration supported Senator Baker's Senate Concurrent Resolution 6. It was not a substitute for a comprehensive bill, but it would alleviate the situation in States whose Interstate highway authorizations were running short.

He had not yet completed work on the Department's bill, but he would outline its broad concepts, provide the Administration's views on S. 502, and respond to Senator Bentsen's questions to all witnesses.

The Senate's adoption of the Cooper-Muskie amendment in 1972 "broke important new ground in adding flexibility to the uses [of highway funding], and we believe it is of utmost importance to continue in this direction. Federally supported highways had made cities accessible, but too many cars made them almost inaccessible at times. At the same time, public transit systems "have become increasingly incapable of offering attractive alternatives."

The Administration would address these problems in three directions. First, it would propose to extend the FY 1974 funding level of $1 billion for UMTA to continue another 3 years. Second, local officials could use General Revenue Sharing ($6 billion a year) to address pressing needs. And third, Secretary Brinegar favored additional flexibility in the use of Highway Trust Fund revenue in urban areas to deal "with transportation alternatives that will improve the cities' overall transportation systems." They were not a substitute for UMTA's capital program:

> Rather, they will be aimed more at the myriad of capital needs that every urban area has and can best develop its own program to solve. No doubt, funds will go to meet highway needs, some will go for bus lanes and related investments, some will go to purchase buses, and

> some would go to make capital improvements in urban rail systems. The end result, of course, is to allow cities to find ways to improve their overall transportation systems. The fiscal year 1974 budget sets an authorization of $1.1 billion for this purpose.

He emphasized that he did not agree with those who thought the use of Highway Trust Fund revenue for nonhighway projects was unfair to highway users who paid the tax. First, motorists would be better off if mass transit, whether bus or rail, reduced traffic on urban roads to relieve congestion. Second, he pointed out that the taxes combined into the Highway Trust Fund were existing taxes credited prior to 1956 to the general Treasury. Approximately 50 percent of highway user revenue would have been collected for general purposes if the Highway Trust Fund had not been created. "Thus, on grounds of equity it seems fair to consider that a sizable amount of trust fund moneys could be legitimately used for transportation purposes that broadly benefit a large segment of the population."

The only question was to determine the "fair portion" of Highway Trust Fund revenue that could be used for this broader purpose. He considered one-quarter of the general fund-type taxes to be fair. Therefore, he was recommending that $1.1 billion or slightly over 20 percent of all Highway Trust Fund revenues be available for flexible uses. Accordingly, Federal-aid urban system funds should be available for capital highway and mass transit projects, including rapid rail systems, subject to decisions by State and local governments. Similarly, State officials should have the option of using Federal-aid highway funds in rural areas for highways or bus service projects.

Secretary Brinegar also discussed the pass-through provision. The Administration had supported pass-through for local general purpose units of government that created a metropolitan agency equipped to address transportation problems on an areawide basis. The Senate's 1972 bill had adopted the idea. S. 502 contained a similar provision, the difference being that the cutoff for earmarking funds to urbanized areas was 250,000 population instead of 50,000. The Administration had modified its position as well:

> We would recommend that the urban system funds be earmarked only for urbanized areas which have a population of 400,000 or more. Some 55 areas fall into this category. We believe that the problems of such cities are extremely complex and that these cities are more likely to have the organization and staff to solve their own problems. For areas smaller than 400,000, we think that the State should continue to play the primary role in developing transportation programs. Also, we would recommend a modification which would permit general purpose agencies to be the recipients of pass through funds, as well as single purpose transportation agencies. We encourage the formation of State departments of transportation, for example, but we do not believe that the Federal Government should be fostering the creation of otherwise unnecessary special purpose agencies at the city level.

The Department wanted to continue the vital Federal-State partnership "and we envision the States playing an important role in determining suitable institutional arrangements, such as having the authority to approve the makeup and boundaries of local general-purpose agencies chosen to receive the funds."

In 1972, the Secretary recalled, the Administration had supported the Interstate transfer provision of the Senate's 1972 Act that authorized unlimited mileage to facilitate transfers and substitutions, with the estimated cost of the withdrawn segment determining the amount available for substitutions. S. 502 differed in allowing the substitution of other important highway and public transportation projects. Secretary Brinegar described this change as "a laudable move toward flexibility," but he suggested several changes. In particular, "we do not believe that as a general rule, if an interstate segment is dropped, a new interstate segment should be designated." The State and locality should "be given the option to use these funds on any other Federal-aid system, including the urban flexible fund, at the prevailing matching ratio."

Regarding the proposed alternative Federal-aid highway procedures, he was concerned that they stripped the Secretary of adequate controls. He favored a more moderate approach similar to the procedures used on the Federal-aid secondary program. Extending these procedures to the other systems would "eliminate unnecessary engineering and construction supervision and still retain the cooperative Federal-State relationship that has existed over the past 50 years."

He favored consolidation of categories, particularly those focused on urban areas, and urged Congress to "resist the continued proliferation of new categorical grant-in-aid programs." They were inconsistent with the goal of increased flexibility for State and local officials. He also opposed the priority primary concept. "Now that the Interstate System is nearing completion, we should avoid the creation of such programs and should give the States more flexibility to determine and meet their future transportation needs."

The Department's bill, he said, would request authorizations for 3 years instead of the traditional 2 years. "With the failure to enact a bill last year, to remain on a biennial cycle could require Congress to enact a bill this year and then again next year."

Finally, he addressed an issue that had come up during his confirmation hearing, namely whether Congress should exempt specific projects from environmental statutes. He had replied at the time that he generally did not favor granting exceptions. Now, he said, he could say that he opposed the practice because, "it is my belief that granting exemptions for single projects increases pressure to exempt a large number of other sensitive projects, and could seriously compromise the environmental laws which Congress has directed me and others to enforce." [*Federal-Aid Highway Act of 1973, S. 502*, p. 95-102]

Senator Bentsen began the questioning by recalling that in 1972, Secretary Volpe had assured the Public Works Committee that OMB had promised to let FHWA spend the $3.25 billion in the 1972 bill for the Interstate System. S. 502 retained that amount and Secretary Brinegar had mentioned it, but the President's budget referred to only $2.6 billion. Initially, the Secretary deferred an answer because he had been focusing on "the larger issues, the general thrust of the program" during his few weeks in office. He had not had time to review Secretary Volpe's testimony or speak to him about it. In a written response submitted later, the Secretary explained that Interstate funding was a long-term measure; if sufficient funds were not made available in one year, they would be made available in a subsequent year. The $2.6 billion in the President's budget for FY 1974 was the program level needed "to promote the economic well being of the Nation."

Looking at the budget for the entire program, Senator Bentsen saw the Administration was requesting a total program of $5.35 billion, but only $4.4 billion in obligations. "Are we saying that you are talking about impounding approximately a billion dollars?" Secretary Brinegar acknowledged that impoundment "is a particularly technical and, partly, legal issue" but it was one that "I am not prepared to discuss today in any depth."

If the country was not going to spend the tax revenue collected, Senator Bentsen asked, should the tax be reduced? The Secretary had not yet reviewed enough information to comment on needs, "but I do want to make the point that the revenues and program levels each year have not necessarily balanced out." He cited Administrator Ruckelshaus' plan to ration gasoline in the Los Angeles area as an example of how future revenue levels are not easily predicted. He later submitted a written reply that the Administration did not recommend a tax change now, but tax rates could be considered in the future "as we attempt to define a Federal transportation program for the post Interstate period." [*Federal-Aid Highway Act of 1973, S. 502*, p. 102-105]

Senator Buckley, during his question period, said that "the heartbeat of the city lies in movement" and pointed out that since he understood that 50 percent of Highway Trust Fund revenue came from urban areas, "I think this should be an allocation of a fair share to the cities." He was concerned about the article in *The Washington Post* indicating that the post of Assistant Secretary of Transportation for Environment and Urban Affairs was being abolished. He pointed out that this was the office that reviewed all NEPA statements and this function "would be assigned, for example, respectively to the Federal Highway Administration and Federal Aviation Administration," as contained in a DOT Order dated February 5.

Secretary Brinegar appreciated the opportunity to correct the article. He had simply reorganized the Office of the Secretary "so that the areas I find most closely related are under the proper staff people." He now had an Assistant Secretary for Environment, Safety and Consumer Affairs "so the function has by no means been moved away." He shifted the urban systems function to the staff involved with planning and programs across the whole system. Moreover, former Assistant Secretary Hirten was now "my principal assistant, and will advise me personally on matters in the environmental area." He continued:

> The responsibility for reviewing environmental statements was placed with the administrators. This was based on my conception and belief that these people should be forced to deal responsively with the environmental issues. I am by no means turning my back on these things . . . . I think we are strengthening them in a way that will allow us to speak more quickly and more effectively. [*Federal-Aid Highway Act of 1973, S. 502*, p. 105-106]

Senator Pete V. Domenici (R-NM), a former Mayor of Albuquerque who had won his first term during the 1972 Nixon landslide, recalled Senator Muskie's reference to robbing Peter to pay Paul. Since the country had enough highway needs for all Highway Trust Fund revenue, was that not what we would be doing, robbing Peter to pay Paul, if that revenue were diverted to other needs? Secretary Brinegar had not yet fully absorbed all the data to respond, but did believe that "the problems in front of us are very much tied to highway problems as we move to our big cities, so I must say yes, there are adequate funds to do what we are trying to do in the near term." [*Federal-Aid Highway Act of 1973, S. 502*, p. 106-107]

Senator William L. Scott (R-Va.) said he was frustrated about delays in building I-66 into the city. "I hate to think that our Government is so ineffective that we cannot build a highway." (Scott had defeated Senator Spong in November 1972 and was serving his first term; he was the first Republican to represent Virginia in the Senate since the post-Civil War reconstruction era.) He knew about the court action delaying the route, but he wanted to know what the Secretary could do to expedite construction "and without telling us why it cannot be built." Secretary Brinegar noted that he now lived in Virginia and was aware of the problems of getting into and out of the city. However, "I have to admit I have not yet gotten to I-66." [*Federal-Aid Highway Act of 1973, S. 502*, p. 107-108]

Senator Baker agreed with Senator Scott about the need for I-66, but wanted to state that Senate Concurrent Resolution 6 was not a substitute for the needed comprehensive legislation. "The resolution is simply to enable the Interstate to proceed at once, so as to avoid the prospect of losing this construction season." He cited his home State of Tennessee, which he said "will miss bid opening for this spring, and will effectively, delay for a year completion of much needed sections of the Interstate Highway System." [*Federal-Aid Highway Act of 1973, S. 502*, p. 108-109]

When Senator Bentsen's turn came again, he asked for the Secretary's position on operating subsidies for mass transit. The Secretary mentioned that he would be testifying soon before the Senate Subcommittee on Housing and Urban Affairs and would oppose subsidies. In that case, what did the Secretary think about adding a penny to the gas tax for mass transit, a proposal that would raise $1 billion over 5 years? Secretary Brinegar could not speak directly to the question but said that President Nixon "has spoken in broad terms about not wishing to raise any taxes in the years that are ahead of us." [*Federal-Aid Highway Act of 1973, S. 502*, p. 109-110]

Senator Buckley, in his second round of questions, asked if the Department was studying the post-Interstate period "when the primary national interest in the highway construction is at an end"? One idea was to turn the major responsibility for highways over to the States. Secretary Brinegar explained that the 1972 Report to Congress on National Highway Needs covered the period of the 1970s. The 1974 report would cover the 1980s. "It is far too early, however, to draw any conclusions, but certainly we would not rule out studies of the feasibility of reducing the Federal role substantially and placing greater control in the States and communities."

The Senator also asked if the delegation of final NEPA authority to the Modal Administrators had been cleared with the Council on Environmental Quality. The Secretary replied in bureaucratic terms:

> Sir, there again, the use of the word final is not proper. What we are striving for is to have the work done in the agencies. We feel they must work with the concepts in the organizational structure that is down the line. Final authority has not been delegated. I have a staff process to make sure that we are involved. We are discussing it with the Council on

> Environmental Quality, and we will proceed properly, I assure you. [*Federal-Aid Highway Act of 1973, S. 502*, p. 110-111]

Senator Domenici, in his second round, wanted to make clear that although New Mexico was a rural State, he fully supported mass transportation. However, with roadway needs so great, he questioned the idea that diverting highway funds "could really have an impact on that [mass transit] need when we see systems that are costing five, six, eight, 10 times the original estimates in their experimental stages." Secretary Brinegar thought the issue came down to two questions:

> First, are we able to forecast the cost of the system when we start—and that is an issue I will address myself to as an administrator—and, second, how do you establish, allocate priorities?

He would do his best to address both points over time.

Finally, Senator Domenici emphasized that he wanted to be sure that rural States received their fair share of the roadway dollar. Could Secretary Brinegar confirm that "a State like ours with no desire to have a mass transportation operation in it would not get less than it would have otherwise received?" The Secretary replied, "Yes, sir." [*Federal-Aid Highway Act of 1973, S. 502*, p. 111-112]

Senator Scott asked the Secretary's view on retaining all highway tax revenue for highways until the Interstate System was completed before considering diversion. "It just seems, Mr. Secretary . . . that if you are using all of the money for one purpose and then you start using it for two purposes, that the consequence will be delay." The Secretary said he did not see the split as involving two purposes. With 80 percent of the Interstate System open, and most of the remaining mileage in urban areas, the use of Highway Trust Fund revenue for mass transit "is just a matter of adding another step to help the cities solve the problems."

After again discussing I-66, which then ended at the Capital Beltway and was his commuter route into the city, Senator Scott asked about the suggestion that highway funds bypass the State highway agency and go directly to urban areas. The Secretary acknowledged that areas over 400,000 population, including two in Virginia, would have the option of receiving the funds directly on a pass-through basis. He also acknowledged that Highway Trust Fund revenues could be used for mass transit at local option. The Senator made his position clear:

> Let me say unequivocally, I will vote against any measure that takes any money out of the highway trust fund for any purpose other than highways until the Interstate System is completed, so you have one obstinate member of this committee. [*Federal-Aid Highway Act of 1973, S. 502*, p. 112-114]

Senator Randolph emphasized the importance of citizen involvement in highway planning at an early stage. He had tried to provide needed legislation, but wanted to know if the Secretary could direct FHWA to more fully implement the statutory requirements. "I do not want to use the word 'subvert' lightly, but I think this has been happening."

The Secretary had not yet considered this issue, but promised to submit a response in writing. His written statement indicated that additional legislation was not needed. FHWA had been working aggressively in this area through policy requirements and research. One policy, which had been implemented in September 1972, directed the State highway agencies to develop environmental Action Plans for identification of social, economic, and environmental effects; consideration of alternative courses of action; involvement of other agencies and the public; and use of a systematic, interdisciplinary approach. The plans had to include early citizen participation in the highway development process. Details were left to the States, which could exercise considerable freedom based on their unique needs and condition. [*Federal-Aid Highway Act of 1973, S. 502*, p. 114-119; *America's Highways 1776-1976*, FHWA, 1976, p. 375]

Senator Muskie used his next question period to ask several quick questions. Did the Secretary support the revised Cooper-Muskie amendment, now called the Muskie-Baker amendment? "We are looking at it." Did the Secretary believe a formula should be developed to limit State highway department discretion in urban areas? The Secretary supported pass-through of Federal-aid urban system funds for urban areas with populations of 400,000 or more. Did the Department have a view on S. 739, which allowed the Secretary to use up to 10 percent of the Highway Trust Fund for emergency plans in areas such as Los Angeles that could not meet air quality standards? The Secretary was not ready to offer a position.

What was the Department's position on substituting the Governor for the State highway department as the primary policymaking authority for highway programs? The Secretary submitted a written response that substituting the Governor "would cause serious difficulties in States where transportation policy-making authority is vested in the State legislatures." In other States where the highway agency is responsible to the executive branch, "an amendment along these lines has no major impact." The department would not support such a change.

Senator Muskie wanted to respond to the argument that the provision might discriminate against rural areas and States:

> I would like to point out that 51 percent of all trust fund revenues come from urban areas, and for regular Federal aid routes other than Interstate, urban areas receive $475 million, while rural areas receive $950 million. So the argument of discrimination ought to be in the perspective of those facts. [*Federal-Aid Highway Act of 1973, S. 502*, p. 119-120]

Senator Bentsen asked how the Secretary arrived at the figure of 400,000 as the cut-off for pass-through to urban areas. Secretary Brinegar said "we looked at the list of cities that might be affected, and in looking for a proper breaking point for the various urban areas, 400,000 seemed to give us the 55 major areas we thought should be included." He was open to considering different views. "We don't have the final answer." [*Federal-Aid Highway Act of 1973, S. 502*, p. 123]

The Secretary's Busy Day: P.M.

That afternoon, Secretary Brinegar appeared before the Subcommittee on Housing and Urban Affairs of the Committee on Banking, Housing and Urban Affairs to discuss the proposed

Emergency Commuter Relief Act, S. 386. Senator Williams had introduced the measure on January 16 to provide for Federal-aid to defray operating expenses of mass transit systems. At the start of the hearing on February 6, Senator Williams said:

> This would be a program of grants on a two-thirds Federal, one-third matching basis, to State or local bodies to assist any mass transportation system maintaining service in an urban area, and to pay operating expenses incurred as a result of providing this service. Included within the terms of such assistance are grants for debt servicing for mass transit investments.
>
> The operation assistance provisions are geared to fulfilling three prime objectives: Maintenance of service to the public; stimulation of further ridership, especially in the commuter peak-hour category; and assistance to communities in meeting their overall development aims.

The bill authorized $800 million over the next 2 years, a figure based on the hearing record during the 92nd Congress. It also provided $3 billion in contract authority for the capital grant program under the Urban Mass Transportation Act of 1964 and increased the Federal share to 90 percent for capital assistance projects to provide parity with Interstate highway projects.

He stated that, "Today, we once again begin hearings—or rather rehearings—on the problems and prospects of mass transit," adding, "Like the Gospel, we don't expect the story to contain any surprises—its strength and power is in the retelling." Many witnesses would testify, but "even as we hear their testimony, we must face the grim fact that costs are going up, fares are increasing, and as a result, service is being curtailed and more and more transit riders are being forced to use private automobiles."

They had heard all the arguments against the measure in previous years. The delay in passing the 1972 bill had "the one great benefit . . . that the grim predictions once made to rebut such arguments have come to pass." More systems had failed and gone into public ownership while ridership declined as a result of deteriorating service. [*Emergency Commuter Relief Act*, Hearings on S. 386, Subcommittee on Housing and Urban Affairs, Committee on Banking, Housing and Urban Affairs, United States Senate, 93rd Congress, 1st Session, February 6 and 7, 1973, Government Printing Office, 1973, p. 1-3]

Before beginning testimony, Senator Williams introduced statements on the bill. Senator Adlai Stevenson III (D-Il.), a cosponsor of the bill, pointed out that similar legislation had passed over the past 2 and a half years, "only to have its final passage founder." Events during this period had rendered the situation a true "emergency," and more appropriately a "crisis." He cited Chicago as an example:

> Chicago is under the threat of an order to be effected on February 18 raising Chicago Transit Authority fares to 50 cents—from 45 cents, already the highest average fare in the country—closing down 23 "L" stations altogether, eliminating 18 bus lines, and curtailing most evening and weekend service.

Chicago faced all the "attendant problems of pollution, relatively high energy consumption, congestion, too much concrete, and too little parking" that can lead to proposals such as the EPA's draft plan to ration gasoline in the Los Angeles area. "The time is now to save mass transit. In doing so we shall be saving our cities." [*Emergency Commuter Relief Act*, p. 10-11]

Senator Weicker's statement said that he had supported $800 million for subsidies in 1972, but had to exercise "some degree of caution" on S. 386 because he opposed "underwriting mediocrity, ad infinitum." Operating subsidies "must go hand-in-hand with programs that will renovate and improve our transportation systems." Opening up the Highway Trust Fund to transit, which he expected to happen in 1973, would not be sufficient to revitalize mass transit systems.

Further, "We have seen what happens when transportation decisions have not been made by living humans, but rather by a highway trust fund created in 1956." Since then, an "automatic pilot" had been turned on that allowed the "trust" concept to shape transportation policies. "Trust fund sounds so proper," he said, but "the fact is that with the creation of the trust fund, the Congress of the United States turned over its responsibilities in the area of transportation to private interests." He did not want the same pattern to apply to operating subsidies. Too often, cities examining mass transit "found a fatal downhill spiral of increasing fares, decreasing service, and diminishing ridership." He said:

> The only way we can break away from deficits is by making a sufficient investment in research and development and capital improvements. We cannot expect the American taxpayer to shell out money to cover deficits, ad infinitum. This runs directly in the face of good business practice or good Government practice.

He strongly supported the additional $3 billion to address capital needs:

> To have balanced transportation in America, we must have a balanced attack on the deficits that plague the mass transit sector of our transportation systems. The approach taken in the allocation of $3.8 billion in the proposal we are considering today represents a most responsible and intelligent step in dealing with the mobility crisis in America. [*Emergency Commuter Relief Act*, p. 12-14]

Representative Koch appeared to discuss a bill he had cosponsored, H.R. 2734, with Representative Fernand J. St. Germain (D, RI) to accomplish the same purposes as S. 386. After discussing the provisions of H.R. 2734, he said, "Outside help must be forthcoming if public transit is to be properly utilized." He cited the new element of compliance with the Clean Air Amendments of 1970. New York State's Department of Environmental Conservation had developed an air quality implementation plan that called for transportation control strategies involving fundamental changes in New York City's transportation patterns, including restriction of vehicles during peak hours. The plan was geared to the 1977 deadline permitted by an EPA extension, but a recent decision by the Third District Court in Washington reversed the extension, "putting the city under even greater pressure than originally anticipated."

He said he'd been before this committee, at this same desk, for 4 years, and hoped something would be different this time. Given all the support for mass transit, "it is hard to understand why . . . we haven't had more success." [*Emergency Commuter Relief Act*, p. 14-16]

At 2 p.m. on February 7, Secretary Brinegar appeared before the committee accompanied by UMTA Administrator Frank Herringer and the Department's General Counsel, John W. Barnum. Although the Department had not yet completed its bill, the Secretary was prepared to offer his views on S. 386.

Regarding subsidies, the Secretary understood the plight of urban mass transportation. "Yet, I cannot believe that the approach proposed in S. 386 is the proper one." Although every system was losing money, just five of the systems were responsible for 70 percent of the losses or $500 million (New York, Boston, Chicago, Philadelphia, and Los Angeles). New York City, for example, reported a deficit in 1968 of $77 million, but the shortfall had increased to $179 million in 1972. "Simply offering to divide up $400 million a year amongst the Nation's transit systems certainly will not arrest rapidly increasing deficits such as these."

Federal operating subsidies would offer the "easy way out," he said, "and passing the higher costs and inefficiencies upward to the Federal level is to invite an accelerating subsidy program." Subsidies would offer an excuse for system operators and their political partners to avoid addressing fares, routes, personnel, and wages that "can only properly be dealt with at the local level where the real knowledge and responsibility exists, and where ultimately the tough decisions have to be made." The Secretary stated that "it is by no means clear that either the causes or the solutions are simple enough to be addressed by such a subsidy grant program as here proposed."

Finally, with over 1,000 transit systems in the United States, and at least 300 serving metropolitan areas of 50,000 and over, at least 500 would qualify for subsidy under S. 386. Properly judging needs and distributing the funds "would be most serious not to say costly, and time-consuming." He cited labor costs:

> Some systems, for example, have labor costs that are 60 percent of revenues while others are 80 percent. Should we insist that labor costs—or even particular labor rates—go down in the high ones or revenues up, or a little of both, or what?

He did not want to be so negative, but "this problem, like many in our country, cannot be best handled by yet another Federal grant program."

He did support the provisions of S. 386 that increased capital grants funding and the flexible use of Federal-aid urban system funds. However, he opposed the provision to increase the Federal share from 66¼ to a mandatory 90 percent for capital grant projects. "We do favor shifting the maximum percentage to 70, to provide a level that makes it equal with highway funds, other than Interstate, and with the proposed flexible funds from the highway trust fund." [*Emergency Commuter Relief Act*, p. 49-53]

Senator Williams detected what he considered an inconsistency. The Secretary acknowledged in questioning that the Nixon Administration's proposal for Special Revenue Sharing for Transportation would have allowed the use of funding for operating subsidies. To be consistent, the Senator said, the Secretary should support the use of Federal-aid urban system funds for the same purpose. The Secretary disagreed:

> When you have highways in the cities—and they do impact on transit systems in terms of capital construction—we feel that the money in the highway trust fund can legitimately be brought over and used to extend or modernize the transit systems that are intimately connected with the highway system. But to try to embrace within those concepts the operating deficit problem, we feel would overwhelm this program. [*Emergency Commuter Relief Act*, p. 54]

Senator Robert Taft, Jr. (R-Oh.) asked if S. 386 should be amended to include an allocation formula for the operating subsidies. Secretary Brinegar could not state a position since he opposed the operating subsidies. In that case, Senator Taft asked, would the Secretary's position be different if the legislation required transit systems to submit comprehensive mass transportation service improvement plans in return for help with operating expenses. The Secretary said, "I would have trouble embracing that, because, as I indicated, I think the proper long-term solutions are going to have to come from allocations at the local level." [*Emergency Commuter Relief Act*, p. 56]

(Secretary Brinegar's comments about the departmental changes did not entirely satisfy the environmental community. An editorial in *The Washington Post* expressed concern about abolition of the post of Assistant Secretary for Environment and Urban Systems noting that Hirten had "performed valiantly" under Secretary Volpe. The *Post* also expressed concern about shifting environmental approvals to FHWA and the other agencies that funded the projects.

(Concerns about these moves "were not relieved" by Secretary Brinegar's explanation of them. However, DOT "loyalists" assured observers that, as the *Post* put it, "there is nothing sinister afoot at all." The Secretary had simply needed to free an Assistant Secretary slot for congressional and intergovernmental affairs. Environmental affairs was chosen because, the editorial summarized, "the old-line transportation agencies have become so infused with an environmental conscience, and so tied to detailed review procedures, that a separate review office has become superfluous."

(The *Post* was willing to take a wait-and-see approach, but "this is no time to back off from close review of specific projects, or from the broad assessment of alternate strategies." ["Switching Tracks at DOT," *The Washington Post*, February 17, 1973])

Carmack Cochran, speaking on behalf of the American Transit Association, addressed some of the points Secretary Brinegar had raised. Cochran said that since the idea of operating subsidies had first come up in 1970, two major points against it had been cited. "First, critics say it won't work [and that] it will not prevent the decline of transit." He cited the exclusive bus lanes on the Shirley Highway and cities where subsidies "have been instituted, and as a result, fares and deficits have stabilized and riders increased" (Denver, Colorado; Erie and Reading, Pennsylvania; Louisville, Kentucky; Madison, Wisconsin; Oakland, California; and Tulsa, Oklahoma). He said:

> The important point is that an operating subsidy is not a stopgap measure to prop up financial deficits. It is not a case of pouring funds down a rathole. It can indeed breed incentives, improve service, lower fares, and reduce the number of automobiles congesting our streets and polluting the air. The key is the infusion of operating funds.

The second argument against operating subsidies was that “revenue sharing will enable local officials to take care of the problem.” Carmack explained that in a survey of 1,000 transit systems, the association found that only 5 cities used General Revenue Sharing for transit operations (Detroit, Little Rock, Terre Haute, New York, and Wichita). One reason for this lack of usage was “that only 25 percent of all the publicly owned transit systems are within city departments supported by funds from the regular city budget, and are thereby the beneficiaries of general revenue-sharing payments.” The remaining systems are “independent public authorities supported from their own sources of income.”

On behalf of the American Transit Association, Cochran urged Congress to “act swiftly and decisively to enact transit assistance legislation” as its “No. 1 priority.” [*Emergency Commuter Relief Act*, p. 65-68]

Familiar Voices

Many of the organizations that had testified on the Federal-Aid Highway Act of 1972 testified again in 1973. Because of the large number of witnesses, Senator Bentsen limited the witnesses to 15 minutes, although witnesses could submit written testimony of any length.

ARBA’s Daniel J. Hanson testified on February 7, accompanied by J. L. Cone, Jr., of ARBA’s Contractors Division, Eugene M. Johnson of The Asphalt Institute, and Ray W. Burgess, ARBA’s senior vice president and Director of Public Works for Baton Rouge, Louisiana. Hanson based his statement on policy positions ARBA’s executive committee had approved on January 22, 1973.

ARBA supported completion of the Interstate System at the earliest possible date. To accomplish this goal, Burgess read the policy position calling for $4 billion a year, not the reduced amount of $3.25 billion a year in S. 502:

> The program has been stretched out too long already. This stretch out has cost a great deal of money, transportation efficiency has suffered, and needless human lives have been lost.

With funding delayed, ARBA recommended extending the deadlines included in the Federal-Aid Highway Act of 1970 for deletion of Interstate segments that did not have a schedule for expenditures (from 1973 to 1975) and for which PS&E had not been approved (from 1975 to 1978). “Under the unfortunately adverse circumstances we have been confronted with in recent years, additional time is needed, and we believe this additional time will afford the States time to get these projects in line.”

ARBA, which also backed a strong Federal-State partnership for the Federal-aid highway program, opposed the pass-through provision:

> The difficulties of establishing "suitably equipped and organized" metropolitan transportation agencies are immense. If we are to maintain the same level of professional competence which the program now enjoys, "pass through" will require greatly increased staffing in both local and Federal highway agencies. In our opinion, the potential benefits are simply not worth the additional staffing requirements and other necessary added on functions.

Burgess added that while flexibility has much merit, "too much flexibility may result in completely losing the identity of the long and well established Federal aid highway program." The pass-through bypassing the State highway agencies "would greatly complicate the overall administration of the highway program without any significant offsetting benefits."

Hanson also expressed concerns about S. 502's "alternative highway procedures." Under certification acceptance, FHWA waived the requirement to obtain Federal clearances at each stage of project development, with final acceptance based on an inspection of the finished project. S. 502 proposed that FHWA would certify that the highway agency would meet all Federal requirements. ARBA was concerned that FHWA would have to establish "elaborate machinery" to review each agency's operations. "While the objectives are desirable, in our opinion, a more evolutionary approach is needed." Burgess added, "There is a real possibility that this effort to avoid redtape would actually impose an additional burden of redtape."

In support of highway-oriented public transportation, ARBA recommended that highway funds be made available for road projects that "will enable bus transit to reach its full potential with respect to speed and convenience . . . ." In particular, ARBA wanted to remove the restrictions in 23 U.S.C. 142(d) and (e) on the use of Federal-aid highway funds for fringe or transportation corridor parking facilities. Johnson explained:

> At the present time, the restrictions referred to above make it quite difficult to establish project eligibility for transit-related highway improvements. We believe it should be made as easy as possible for highway departments to use highway funds for physical improvements in support of bus transportation.

ARBA did not support the use of highway funds to acquire buses, but did support creation of an urban public transportation trust fund.

In view of the long lead time needed for highway projects, ARBA opposed impoundment of Federal-aid highway funds:

> In 1956, Congress said that in effect, you can not have it both ways. If you want the advantages of financing a program from a special fund, you will have to suffer the disadvantages of working within the capability of that fund.
>
> The response of the Executive Branch, as expressed through the current impoundment policy, has been somewhat different. The Administration feels that the program must suffer the disadvantage of special funds without enjoying any of the advantages. The taxes are

> levied, theoretically at least, at levels intended to sustain the highway program authorized by Congress. However, the level of active obligations has been substantially below that level in recent years.

ARBA did not want to abandon the Highway Trust Fund. "It must be said, however, that the Highway Trust Fund, as it has been administered for the past several years, places an inequitable tax burden on the highway user."

During the brief question period, Senator Bentsen explained that "the problem we face is one of continued inflation in this country . . . and that is the present reason for substantially reducing the levels of authorizations" for the Interstate System. He asked Burgess if he believed the urgency of Interstate needs overrides the need to control inflation. "Absolutely," Burgess replied, citing the safety benefit. He also doubted that increasing Interstate authorizations would cause inflation.

The Senator commented that Johnson had discussed support for an urban public transportation trust fund but had not indicated how it would be financed. Would ARBA support a 1-cent increase in gasoline taxes for this purpose? Johnson replied that ARBA had not taken a position on this idea, but he did not think the organization would be supportive. Then, Senator Bentsen asked, what should be the source of revenue? Johnson could offer only his personal opinion that the trust fund should equal whatever percentage of general Treasury revenue was being authorized for UMTA's programs.

Senator Bentsen also asked Johnson why ARBA supported highway-oriented public transportation but not the use of Federal-aid highway funds to purchase buses. Johnson replied:

> I feel that the highway trust fund is for highway construction, and all of the appurtenances of the highway itself, rather than the vehicle that is driven. [*Federal-Aid Highway Act of 1973, S. 502*, p. 133-158]

L. P. Gilvin appeared before the subcommittee on behalf of the AGC. In introductory comments he stated that AGC could not support diversion of Highway Trust Fund revenue to mass transit, which he described as "meaning generally rail lines in a handful of our largest cities." Congress should look into mass transit needs as it did before initiating the Interstate System. He suggested establishing a Mass Transit Trust Fund as "the best possible way to provide funds" for that purpose.

AGC's statement explained that in 1956, a "solemn commitment" was made with highway users that revenue for the Highway Trust Fund would be used only for highways. In seeking funds for mass transit, some advocates stated that the Highway Trust Fund now had a "surplus" that could be diverted, but this was a false statement. The idea that highways and mass transit needs could be met from the Highway Trust Fund "is ill advised, to say the least." AGC recommended a separate Mass Transit Trust Fund, stating only that the source of revenue should be other than the existing highway and airport trust funds.

The pass-through of highway funds to urbanized areas "would destroy the current Federal-state relationship " by allowing local officials to choose options that "would negate the planning and coordination of the State Highway Department or State Department of Transportation." AGC's statement continued:

> Another disruptive feature of the "pass-through" is that it would be likely to allow politics to play a large part in determining how the funds are used. We feel that allowing politics to become involved would be detrimental to the highway program, mass transit projects, and the nation.

In brief questioning, Senator Bentsen asked about a possible source of funds for mass transit. Gilvin could suggest only that a Department of Housing and Urban Development program provided funds that communities could use for buses. [*Federal-Aid Highway Act of 1973, S. 502*, p. 158-181]

The Sierra Club followed the AGC to the witness table. Brock Evans, the organization's Washington representative, and Dr. Robert Burco, an international transportation consultant from San Francisco, presented the organization's views on S. 502.

Although S. 502 had some good features, such as its provision for bicycle pathways, Evans said that the Sierra Club had concluded "that the general thrust of the highway legislation seems to be quite destructive of many features of the American environment." It reflected the "same philosophy that we have lived with for so long now, a philosophy that seems to concern itself primarily with moving vehicles as opposed to moving people." The time has come "to look for truly meaningful solutions."

The Sierra Club was particularly disappointed that the section of S. 502 on public mass transportation excluded rail transportation:

> Buses will not do the required job, and neither will traffic control devices; these are just a part of what is necessary.
>
> And while rail transportation may not be a panacea for our transportation ills, it too is certainly a part of any meaningful and truly balanced transportation system.

The Sierra Club was strongly committed to Senator Muskie's amendment and urged the subcommittee to "reconsider this and include rail systems at least as a part of the local option." The club also opposed provisions that had the effect of "further encroachment upon the dwindling scenic and natural resources of the Nation." Evans cited the provision authorizing funds for roads in "remote back country areas of our national forest system." Most of the funding would be used for roads primarily to encourage timber sales.

He objected to the provision of S. 502 that terminated the Federal role in the North Expressway in San Antonio. The club opposed it "not only because it means the destruction of a beautiful park, but also because of the serious precedent which it establishes."

In addition, the Sierra Club opposed the priority primary system, which would have "the probable result of a great deal more adverse environmental impact than if the roads remain as they are now." Evans said the Sierra Club would oppose the "Alternative Federal-Aid Highway Procedures" provision because it would have "the effect of removing the Federal watchdog role of environmental protection . . . by giving, in effect, a green light to State highway departments to proceed with destructive highways without a Federal overview." [*Federal-Aid Highway Act of 1973, S. 502*, p. 182-184]

Dr. Burco explained that the environmental side effects of motorization should be considered when setting urban and national transportation policies. The problems caused by the automobile extended "far beyond the narrow concerns of personal mobility," as the EPA plan for the Los Angeles area illustrated. "Either the law must give, or a way of life must change so drastically that few can comprehend how it could come about." He continued:

> The very same traffic restrictions that may be called for in achieving air quality goals may be those needed . . . a few years later when shortages of petroleum energy may impose restrictions on gasoline availability for much discretionary travel, or at least send pump prices of gasoline soaring to the point where auto-dependent cities make little economic sense.

In S. 502, he did not see "a concern for these environmental externalities," but rather "an attack on even those environmental protections that have been hard won in the Congress and in the courts for park land preservation and Federal environmental impact review."

Much can be done "to break out of the destructive circle of deteriorating environmental quality, citizen protest, blocked urban highway projects and further deterioration of both existing mobility and confidence in Government." Dr. Burco cited Governor Sargent's freeway moratorium as an example of how citizen-initiated issues can lead to "a plan for the future substantially different from the expectations of only a few years ago." That type of review was the responsibility of the Federal Government, he said, not just the States and urban regions.

In particular, States and regions should be able to "choose freely the transportation course best suited to them," as he explained:

> This means not just a local option of where to put an interstate freeway or a network of expressways, but a local option of choice to invest heavily in traffic controls, rail transit if they desire, and greatly expanded local bus services, as an alternative to more urban highway investment.

He recommended opening up the Highway Trust Fund "to a substantial commitment of resources to urban public transportation, including rail systems where locally desired." Expenditures for the urban Interstates should be reduced, with many of the contested urban segments, such as the Century Freeway in Los Angeles, dropped. This move would free up resources for urban transit "now, and not on some distant day" when the consequences of urban motorization would be too severe for remedy.

He favored the creation of regional transportation commissions and said that a pass-through of funds would put the modes on a more balanced footing. Balance can more readily be obtained by an organization with "the governmental capability for resolution of problems close to these problems, rather than in a sometimes distant State capital." [*Federal-Aid Highway Act of 1973, S. 502*, p. 184-189]

As with the other witnesses, Senator Bentsen asked if Dr. Burco had a recommendation on how to fund mass transportation, such as a 1-cent increase in the Federal tax on gasoline. Dr. Burco thought such a tax might be useful, but believed that additional study of transit needs was essential. He also thought that reducing investment in highway operations in urban areas would free funds for other priorities. [*Federal-Aid Highway Act of 1973, S. 502*, p. 184-189, 192]

The National Wildlife Federation's counsel, Robert M. Kennan, Jr., testified next, stating that his organization "supports the practicable funding for all modes of urban transportation, not only highways and expressways, but also rail rapid transit, from the highway trust fund." The organization opposed the priority primary system as well as the exemption of the North Expressway from Federal involvement.

Kennan also was concerned about developments within the Department of Transportation, particularly elimination of the Office of Environment and Urban Systems and delegation of NEPA review authority to the Modal Administrations. An independent review, particularly of projects under the Federal-aid highway program, was essential to ensure consideration of alternatives, including alternative modes. Further, when the Department was created, the Secretary retained authority under Section 4(f) "to establish a mechanism by which the new Office of the Secretary of Transportation could exercise control over the very independent Federal Highway Administration." Retaining that oversight was vital:

> We have had too much experience with the Federal Highway Administration over the past 5 to 10 years, to be very sanguine about that Agency's dedication to the principles of section 4(f) and the principles of the National Environmental Policy Act.
>
> We do not feel at all comfortable about this new delegation of responsibility.

His formal statement discussed the federation's views in greater detail. It outlined the problem:

> The federal-aid highway program is this nation's largest and most expensive continuing public works project. It provides the means for consummating America's love affair with the automobile. Its offspring include mobility, more diverse productivity, energy depletion, pollution, injury and death . . . .
>
> In urban areas, the highway problem is much more acute. Air and noise pollution from motor vehicle traffic frequently rise to levels that endanger public health. Precious space is taken for parking that could be devoted to more productive uses. New highways disrupt neighborhoods and destroy community cohesion. Finally, highways tend to dominate the fabric and character of our cities.

The statement called the exemption of the North Expressway "a shameful precedent" and expressed relief that S. 502, unlike previous legislation and the House bill in 1972, did not contain any "ill-conceived provisions that would have confounded the confusion resulting from the Congress' first foray into the District [of Columbia] highway matters in 1968."

When Kennan completed his statement, Senator Bentsen asked if he could recommend a source of funding for mass transit, such as the 1-cent gas tax proposal. The Sierra Club had not taken a position on the matter, but speaking for himself, Kennan thought the 1-cent proposal was possible, but added that Highway Trust Fund revenues should be available as well. The Senator asked if Kennan thought the Highway Trust Fund could meet highway and transit needs. Kennan replied:

> Within our large urban areas, the completion of the Interstate System is not a high-priority item. In many cases, the interstate segments that are proposed have been inadequately planned, and mass transit facilities might well replace them.
>
> The highway trust fund, I think, is probably an inadequate level of funds. Perhaps some additional funds from the general funds are needed if we are talking about meeting the basic needs of mass transit.

Senator Scott wondered why the National Wildlife Federation was interested in highways. Kennan explained that "some of the most important continuing problems that we have with protection of the environment of this country are created by highway construction, operation and maintenance." Because Kennan's formal statement commented on the freeway controversy in the Washington area, Senator Scott asked, "What wildlife do we have within the Washington metropolitan area?" Kennan replied that wildlife was not the organization's only interest. "Our concern is with the quality of people's lives." Was he concerned, the Senator wanted to know, about people going back and forth to work from the suburbs? Kennan suggested that one way to help them would be to increase carpooling. When the Senator asked if Congress should mandate carpooling, Kennan stated that while it should not be mandatory, "it is an important component of strategies of local communities . . . to reduce highway congestion during rush hours."

Senator Domenici asked if Kennan agreed that roadways made it possible for people to enjoy America's scenic beauty and its wildlife. Yes, Kennan answered, but too many automobiles were making those places harder to enjoy because of overcrowding. He cited the north rim of the Grand Canyon as an example.

In addition, Senator Domenici wanted to clarify the National Wildlife Federation's views on completion of the Interstate System. Kennan said that organization was mainly concerned about the urban segments. "The Interstate System can be completed without completing many of these very controversial and many very expensive short segments of highways in the urban areas." By contrast, he agreed that Florida needed an Interstate to connect Tampa and Miami. "The concern of the National Wildlife Federation with that particular road is not whether the road is needed, that is quite clear. The question is where it is to be located." [*Federal-Aid Highway Act of 1973, S. 502*, p. 192-200]

The final witness on February 7 was the president of the National Association of Regional Councils (NARC), a member of the County Council of Prince Georges County, Maryland, and chairman of the National Capital Area Quality Planning Committee. Francis B. "Frank" Francois called S. 502 "a good bill" that contained several improvements over present law, "such as giving local decisionmakers a larger role in determining transportation needs and priorities." On behalf of NARC, Francois wanted to suggest several changes to make the program even more responsive to local and regional needs.

NARC, he said, strongly supported the pass-through provision for Federal-aid urban system funds because "local governments acting in concert are the best decisionmakers . . . ." He applauded the provision allowing the use of Federal-aid highway funds for public transportation systems and vehicles, but urged Congress to allow Highway Trust Fund revenues to be used for rail transit as well. The importance of this change had been brought home in recent months because "approximately 70 metropolitan areas have an automobile related air pollution problem that requires the development of a transportation control strategy to reduce pollution to acceptable levels required under the Clear [sic] Air Act of 1970."

For the Washington area, "substantial changes in travel modes" would be needed to meet national air quality standards by 1975. At least $130 million would be needed for buses alone, in addition to the commitments already made to construction of the Metro rail system. Rail was, Francois said, essential in Washington and elsewhere:

> Without this discretion, we are convinced that it will be difficult if not impossible for urban areas to solve their transportation problems, and at the same time meet the necessary air pollution standards imposed under Federal law.

He recommended revising S. 502 to enable general purpose local governments to "effectively participate in the allocation of urban system funds." The metropolitan transportation agency should consist of elected officials from general purpose local governments because that would involve "the real regional decisionmakers" in the process. The bill also should prohibit creation of more than one metropolitan transportation agency in a multi-State urbanized area. To ensure equitable voting procedures within the agency, S. 502 should provide for "a proportionate voting system or in the alternate, a procedure providing that local governments representing 75 percent of the area approve decisions" on the use of urban system funds.

NARC also supported the provision allowing transfer of Interstate locations in urban areas, with reallocation of these routes on a dollar-for-dollar basis.

In addition, NARC agreed with the $1 billion authorization for the rural Federal-aid primary and secondary systems, but recommended requiring the State highway agencies to work with rural regional councils in a joint decisionmaking process.

Francois said that NARC supported the alternative highway procedures, but only if S. 502 included "adequate safeguards to insure that the continuous transportation planning under section 134 is maintained and given weight in making decisions on urban projects."

In response to a question from Senator Scott about metropolitan area decisionmaking, Francois said he did not think the metropolitan transportation agencies should be involved in decisions on rural Interstate segments, but when the Interstate becomes a commuter road in an urban area, "I think that is a local problem for local jurisdiction."

Senator Domenici wanted to clarify the role of the metropolitan transportation agency. Was Francois suggesting that Congress give governmental functions to councils of government? Francois replied:

> From the standpoint that they are becoming operating agencies, no.
>
> From the standpoint they are becoming planning and decisionmaking agencies, yes. I think somebody has to make the regional decisions, and I think the locally elected officials operating through their regional councils are best able to do it.
>
> Once made, those decisions, they are up to the governmental units themselves involved.

Why, Senator Domenici asked, do "we need councils of Government making final decisions . . . instead of the States?" Francois acknowledged that this question "is very real right now in State after State." About 100 years ago, he said, many rural-dominated States gave away their responsibilities to local governments. Today, those States "are trying to regain some of these powers." The decisions, though, should be made at "the level closest to the people affected." Many issues cut across jurisdictional lines and in those cases, either the State must decide or the local governments must come together in regional councils to make the decisions. [*Federal-Aid Highway Act of 1973, S. 502*, p. 218-226]

(Francois, a patent attorney, served in a local capacity until 1980 when he became executive director of the American Association of State Highway and Transportation Officials. He held the post until he retired in 1999.)

Watergate Committee

Elsewhere on February 7, 1973, the Senate's discussion on how to approach the Watergate controversy came to a head.

Senate Majority Leader Mansfield had been disturbed by the early allegations in the Watergate affair and decided that the Senate would investigate them. The Senate Judiciary Committee was the proper venue for investigation, but its chairman, Senator James O. Eastland (D-Ms.), was personally loyal to President Nixon. Mansfield decided that Senator Ervin, chairman of the Subcommittee on Constitutional Rights, should lead the investigation.

Mansfield and Ervin drafted a resolution creating the Senate Select Committee on Presidential Campaign Activities. On February 5, Senator Kennedy had offered Senate Resolution 60 for consideration. Theodore White described the result:

> Angrily, futilely, plaintively, Republicans argued that any investigation of Presidential elections should look into the elections of 1964 and 1968 and the allegations of wire-tapping, fraud, eavesdropping that ran to Lyndon Johnson. Outnumbered, they saw their amendments voted down, and finally, on February 7th, they too joined in the language of the original resolution, voting by 77 to 0 for a Select Committee that would "conduct an investigation and study of the extent, if any, to which illegal, improper, or unethical activities were engaged by any persons . . . in the presidential election of 1972 . . . ." Further, the Select Committee would have the power to subpoena any persons "who the select committee believes have knowledge or information" about such activities. And, finally, it should bring back recommendations for any new legislation "necessary . . . to safeguard the electoral process by which the President of the United States is chosen."

The Select Committee, which quickly became known as the Ervin Committee, would include four Democrats, including Ervin, and three Republicans. Senators Mansfield and Ervin had agreed that at least on the Democratic side, they did not want potential presidential candidates to be included because that would give the investigation a partisan tone. They selected Senators Daniel K. Inouye (Hawaii), Joseph M. Montoya (New Mexico), and Herman E. Talmadge (Georgia). Minority Leader Baker included himself as well as Senators Edward J. Gurney (Florida) and Weicker. [White, p. 230-231]

Reeves quoted President Nixon's comment, captured on the Nixon Tapes, following approval of the resolution:

> "I don't see how the Senate can destroy us," Nixon said that day. "The problem with all this is that it is going to be a television story. But, on the other side of the coin, it may wear out the story after a certain length of time."

Haldeman agreed. It would, he thought, turn out to be the same old thing over and over. "I just can't imagine that the people really get very interested." [Reeves, p. 570)

The Kennedy-Weicker Bill, S. 679

Senators Kennedy and Weicker were the lead witnesses on February 8. They presented S. 679, the Highways and Related Transportation Systems Improvement Act of 1973, before the subcommittee with opening statements that recycled their comments from when they introduced the bill. Senator Weicker left off his ending about cooking a frog and instead concluded by comparing the effort to divert funds from the Highway Trust Fund to a wreck on the highway that backs up traffic for miles in State after State:

> So when New York choked on its automobiles it was not long before New Jersey and Connecticut ground to a halt and then Massachusetts and then Delaware and then Maryland and then . . . . Let's clear this highway trust fund off the highway and get America moving again. [*Federal-Aid Highway Act of 1973, S. 502*, p. 231-258 (Kennedy), 258-268 (Weicker)]

Senator Bentsen began the questioning by saying he agreed that the mutual objective was "to move the people effectively and efficiently." Considering the enormity of the task, the question was whether the Highway Trust Fund by itself was sufficient to meet highway and mass transit needs. He then asked his standard question about an alternative source of revenue, including a 1-cent gas tax increase earmarked for mass transit.

Senator Kennedy agreed that the additional revenue would be helpful, especially for the mass transit system in Boston, but "I do not think we want to lose sight of one of the essential aspects of our proposal," namely giving Governors and metropolitan transportation agencies the flexibility to use non-Interstate funds to "provide for a balanced transportation system assuring safe movement of people, and protection of the environment as well." Senator Weicker agreed that while the additional penny for mass transit might be desirable, it would not address "the point we are trying to make."

If the Kennedy-Weicker bill passed in its entirety, Senator Bentsen asked, should funding continue from the general Treasury for mass transit. "Well, yes," Senator Weicker replied, "there is no question to that fact. Mass transit has been [starved] so long, you have some catching up to do . . . . It is a tragic situation, so you could not meet the needs of mass transit solely from the highway trust fund." Senator Kennedy illustrated this need by citing "over $4 billion worth of applications for mass transit funds, and less than a billion dollars in funding which is available."

Senator Stafford wanted to clarify the bill's plan for distributing funds. The bill requires a State to apportion 50 percent of the non-Interstate funds to metropolitan areas, but he wanted to know if the remaining 50 percent also could be spent in urbanized areas. Senator Weicker responded that their bill left the decision to the Governors and the metropolitan area transportation departments the bill encouraged the States to create. Senator Kennedy added that such a scenario was unlikely since the State legislature was unlikely to approve matching funds in such a case and the Secretary of Transportation retained a veto over the State's plans.

Senator Randolph began his question period by observing that he was "intimately acquainted" with the two Senators' viewpoint. "I am appreciative of their continuing interest, yet I am pleased also at their ineffectiveness to do what they have attempted." Senator Kennedy said that he and Senator Weicker would prefer to think of it as Senator Randolph's effectiveness, rather than their ineffectiveness.

Senator Randolph pointed out that Senator Weicker had been a member of the Committee on Public Works in the 92nd Congress, but left for a post on the Committee on Banking, Housing, and Urban Affairs in the 93rd. "I think it would have been valuable to us, Senator Weicker, had you actually been a member of the committee as we attempted to resolve our transportation problems." That comment was an opportunity for Senator Randolph to say he was upset by a reference in Senator Weicker's introductory statement to the February 6 broadcast of NBC's news magazine show, *First Tuesday*. Weicker had said:

> Slowly, Mr. Chairman, attitudes and people all across America on this issue are becoming more informed. In large part, this is the result of the very proceedings we are participating

> in today—which, in turn, have led to informative news coverage, such as the very fine network program of 2 days ago, on NBC's "First Tuesday," which displayed an informed, in depth, and most valuable contribution by commentator Paul Duke and producer Paul Jefferies.

Senator Randolph, referencing Weicker's favorable comment, said "well you might commend NBC, because they took good care of you." Senator Randolph would not presume to tell the news media "how particular stories should be covered," but he did have some observations on the program, specifically about how he was presented:

> It dealt with those individuals and groups that attempt to influence highway legislation before the Congress . . . . Specifically, the two brief occasions, I think it was 18 seconds, on which I was seen, gave a totally false impression of my position on the issues discussed.

Anyone watching the show, Senator Randolph said, would get the impression that he was "totally inflexible in regard to the use of highway trust fund revenues, and I believe there should be no deviation from past practices, when all of these funds were dedicated solely to highway construction." That was simply not the case, he said. He opposed the use of Highway Trust Fund revenue for rail transit, "but I do believe their use for certain other public transportation purposes are proper." He had given this view in an extensive interview for the program, but the program did not present his views accurately.

Similarly, Senators Kennedy and Weicker were wrong to assert that the Committee on Public Works "has not attempted to cope with the problems of mass transit." He pointed out that the Senate had approved the Urban Mass Transportation Act of 1970, and while the Kennedy-Weicker bill had been defeated in 1972 (by a vote of 60 to 18, he helpfully noted), virtually every member who voted against it had voted for the 1970 Act:

> That indicates that to try to line up sides in a matter of this kind, to speak in disparagement of what the highway program has done in an effort to raid a fund which was created by the Congress for the purpose of doing a specific job, I think, I suggest is the wrong approach.

He added that the Interstate System was not yet completed, many other highway needs existed, and the Administration was impounding funds to accomplish these works. He would "very eagerly and earnestly join" in helping to create a Mass Transit Trust Fund.

Next, Senator Randolph wanted to talk about a strike that was starting on this day. "These people you talked about that need to be moved, those millions of people, or hundreds of thousands of people, are not being moved." By contrast, the automobile did move, he said. "It is not affected by a strike."

(About 28,000 workers from the United Transportation Union had gone on strike against the PennCentral a minute after midnight, February 8, in a dispute over reductions in crew size. Commuters through the Northeast Corridor, from Washington to Boston, would be affected.

On February 9, Congress approved emergency legislation ending the Penn Central strike for 90 days. The legislation also required the Department of Transportation to preserve rail traffic in the Northeast. Workers returned to their duties before President Nixon was able to sign the bill, which had to be flown on commercial jet to the "Western White House" in San Clemente, California. [Jones, William H., "Pennsy Halted by Rail Strike," *The Washington Post*, February 8, 1973; Shabecoff, Philip, "Penn Central Operating Again; Nixon Signs Bill Halting Strike," *The New York Times*, February 10, 1972])

As this example illustrated, Senator Randolph said, "I am not a pessimist, but I feel that those who believe that the answer is rail transit are going to be very sorely mistaken." He said that BART was supposed to be the "showcase of this type of rail transit," but he introduced several articles on the theme that it been a disappointment:

- Harris, Michael, "Optimistic Glow Has Faded," *San Francisco Chronicle*, February 4, 1972 (". . . the cheery economic predictions from the BART management have not been borne out . . . . And when the full system goes into service, the financial problems may grow even worse.").
- Nolan, Dick, "BART's Empty Seats," *San Francisco Examiner*, December 17, 1972 ("BART, the crisis creature that devoured the tax rate, very likely has developed an insatiable appetite for red ink, and this is the biggest BART problem, not merely its operational troubles under automatic train control.").
- Nolan, Dick, "The Puffing of BART," *San Francisco Examiner*, December 17, 1972 ("No amount of gelatinous puffery put out by the BART propaganda mill has been too much to swallow.").

Senator Randolph summarized the articles:

> The article of December 17, 1972, discussed the downward revisions in traffic estimates, BART management has lowered this estimate, they say quietly, to 18,000 passengers per day, from the original estimate of 26,000 passengers per day. Well, the actual traffic is amounting to only 13,000 persons per day. The article says that that "ain't good." I do not want to use that kind of language, but the record so far is not very impressive, and I think perhaps there has been overselling.
>
> I hope that this will not be true in every instance. The article covers the costs and all of these matters that are of concern to you gentlemen who came today, advocating that we siphon off funds dedicated to highway development.

Senator Kennedy responded that he realized Senator Randolph's State of West Virginia needed more roads, "but just do not hold it against us in Massachusetts, in our being able to develop our own transportation system." Washington did not always know what is best for each local community, and he believed the Mayors and Governors should decide what is best. "They are saying, we cannot control the situation, because we have not got the authority or the responsibility." He added:

> Finally, let me say the trust fund has been cracked over the objection, the very articulate and able objection, of the Senator from West Virginia, with the acceptance last year by 48 to 26 of the Cooper-Muskie Amendment . . . . We know that there are very strong men that are arguing that we are trying to kill the Interstate System, but we are not. All we want is a balanced system.

Senators Randolph and Kennedy continued:

> Senator Randolph. Mr. Chairman [Bentsen] . . . I do not want him to accuse me of being parochial any more than I would accuse him of being parochial.
> Senator Kennedy. I want to be parochial. I want to be parochial for Massachusetts, and I want to see the people of that State decide how the funds out of the Interstate System should be spent. That is what I am here for. I welcome that label.
> Senator Randolph. I thought you took a broad view of the country, Senator.
> Senator Kennedy. That is why I supported the Interstate System. I think you can have both. That is what we tried to do, support the national concept of the Interstate System for its continuation, and also to permit the States themselves to be able to resolve their transportation needs. Hopefully, we can get the best of both worlds, I think we can.
> Senator Randolph. Then you support a trust fund for rail transit?
> Senator Kennedy. Well, we have to see how. We would have to see how that is developed. I think what we need is to develop a single transportation fund, rather than a proliferation of different trust funds. If we have a single transportation fund, within that concept there would be a continuation of financing of the Interstate System, but you would also be able from that to devise a formula to develop a balanced transportation system, including all modes of ground transportation and it could be done from a single fund.

Senator Weicker interjected his opposition to a Mass Transit Trust Fund. "The fact is if we indulge ourselves in what seem to be coming [sic] the national fad of the 1970's, we will end up putting all of our money in mass transit rather than in highways." Neither he nor Senator Kennedy wanted such an outcome, which is why they favored a single transportation trust fund.

Because of time problems, Senator Bentsen interrupted this testy exchange so he could call on Senator Domenici, who mentioned that he came from a rural State with only one metropolitan area "and it is barely that within the definition used in Congress." He indicated that highway needs existed in every State, but that "the need for mass transit in spite of your nationalizing it, is regional." He was concerned that their policy would lead to more people moving into metropolitan areas ("by making it more easy to get around") and that would lead to more of the social problems that were common in large cities.

Weicker responded that when he, a single term member of the House of Representatives, ran for the Senate in 1970, "the people upstate, they said, what does he know about our problems. All he knows is mass transportation. That is a problem peculiar to southwestern Connecticut" near New York City. He continued:

> Then, all of a sudden, a highway came through the suburbs of Hartford, and there was one highway too many. They say we do not want this highway and we have got to have an alternative.
>
> It was not mass transit that attracted people to Hartford. The people moved into that area, and all of a sudden, mass transit, the idea of a balanced mass transportation system, not relying on highways, is no longer an issue for southwestern Connecticut, but the whole State of Connecticut is now involved.

He concluded, that "all we tried to do in the bill is to allow, the option to determine how you are going to resolve your transportation problem in your community." The approach would work in Connecticut or New Mexico.

Senator Quentin N. Burdick (D-ND) wanted to know if the bill would reduce funding for States "of wide open spaces, a State of low population" that thrives on roads and cannot support mass transit systems. Senator Kennedy assured him that total funding would increase and that "I think North Dakota would actually come out ahead." But no State would get less than at present.

On a second round of questioning, Senator Bentsen asked about the appropriate size of an SMSA for purposes of handling pass-through funding. S. 502 called for a pass-through for areas of 250,000 population, while Secretary Brinegar recommended 400,000. Senator Kennedy said the Kennedy-Weicker bill set the minimum at 50,000 population, but he thought 250,000 would be satisfactory. In response to another question from Senator Bentsen, Senator Weicker explained that in States where SMSAs followed county lines and included some rural areas, the Governor would be responsible for designating a metropolitan transportation agency that left rural areas to the State.

This exchange concluded Senator Kennedy's and Senator Weicker's testimony. [*Federal-Aid Highway Act of 1973, S. 502*, p. 268-283]

Representative Glenn Anderson was the next witness. He lamented that by a vote of 200 to 168, the House of Representatives had rejected the Cooper-Muskie amendment in 1972. In 1973, he felt "that we will be successful in permitting a portion of the Trust Fund to be used for mass transit purposes." In Los Angeles, he said, he had seen the problems caused by highways and automobiles. "We have seen the strips of concrete rip out homes, and separate entire communities like the Great Wall of China." He had seen the pollution, the freeways that resembled parking lots during rush hour, the wasted fuel. Based on this experience, he was not trying to stop all highways or claim that mass transit was the sole answer:

> But, rather, I am here to urge this committee to permit flexibility in the use of highway trust funds . . . . We do not want to require someone to build a mass transit system—nor do we want to demand that a State construct a highway, if the elected officials do not want it.
>
> The point is, State and local officials should be permitted to select the modes of transportation that they feel are best suited to their particular situation, taking in the

> consideration of the needs of the people, the environmental considerations, and the demand for energy.

The freeways of Los Angeles, he said, had average speeds under 20 m.p.h. This experience indicated that "more and more freeways will not alleviate our transportation problems . . . [but] would only compound our problems, especially with the environment."

He said that he, and the people of the Los Angeles area, understood the rationale behind EPA's January 15 announcement of its plan to meet clean air standards. "But we cannot require a 82-percent cutback [sic] of automobile usage without providing an efficient and economical alternative." Public transportation was essential for the area "to allow people the freedom on which this country is based."

He discussed the use of existing rights-of-way for mass transportation and the provision of a more energy efficient transportation option. As for the Highway Trust Fund, he addressed the argument that the fund was a "trust" reserved for highway uses. He pointed out that "50 percent of the receipts of the trust fund were derived from taxes [in 1974] which were on the books long before the trust fund was created in 1956, and prior to that time, were used for general revenue purposes." Since 1956, he said, "the trust fund, presently, has been so changed to meet other needs that it is difficult to argue that mass transit is not highway related." He cited examples of how Highway Trust Fund revenue was being used for purposes other than highway construction:

> In 1962, Congress allowed trust fund moneys to be used to help relocate families who were forced to move by highway construction.
> In 1970, Congress permitted the use of trust fund moneys to construct ferryboats on the same basis as in the construction of highways.
> Two-thirds of the cost of the highway safety program is paid out of the Highway Trust Fund.
> The 1970 act also permits trust fund revenues to be used for exclusive busways, passenger loading facilities, and fringe parking to serve any type of public mass transportation.

As this list indicated, the Nation could use Highway Trust Fund revenues for ferryboats, but not to purchase or construct a bus or rail transit system:

> In short, the Highway Trust Fund was created to meet our transportation needs by taxing the people of the United States. I contend that a portion of that money for mass transit would certainly help meet that need by eliminating a part of the highway congestion, by reducing auto pollution, and by helping to alleviate our energy crisis.

Specifically, he endorsed the use of Federal-aid urban system funds for rail or bus mass transportation as well as highways. He also recommended the subcommittee amend S. 502 to permit the Secretary of Transportation to allocate up to 10 percent of Highway Trust Fund revenues for emergency mass transit programs in areas targeted by EPA to curtail automobile usage.

Senator Bentsen began the questioning by asking about the difference between the original cost estimate for BART and present estimates. Representative Anderson conceded that costs had increased. “However, to place this in perspective, the Interstate Highway System, approved by Congress at a cost of $27 billion in 1956, is now estimated to cost $68 billion to complete.” He expected BART would work out its problem, but “they will have to get some assistance.”

What about the charge that BART had been oversold and that many people who told pollsters they would ride the line never did so. Again, Representative Anderson conceded that ridership was lower than projected, in part he said because feeder lines had not been started.

The Senator asked his usual question about funding for a mass transit trust fund. Representative Anderson did not favor an increase in the gas tax at this time; his concern “with the financing of our present transportation problems is that it is not flexible.”

Recognizing that Representative Anderson was on the House Roads Subcommittee, Senator Bentsen pointed out that “you have not succeeded on three occasions, at the Rules Committee, Public Works Committee, or on the floor to get the Cooper-Muskie amendment passed.” What were the chances in 1973? Anderson pointed out that he had handled the amendment in the House:

> The Rules Committee, we lost that vote by an 8 to 7 vote. Three of the members who voted against us on that Rules Committee are not back in Congress this year. While we have examined the makeup of the new Rules Committee, we have not had a chance to determine whether it is still 8 to 7 again.

He said that “a number of Congressmen who did not support us last year” did support the amendment this year. “All we needed was a few turnarounds to pass the Muskie-Cooper amendment.”

Senator Stafford asked how many miles of urban rapid rail transit could be built for a billion dollars. Representative Anderson did not know, but he did recall what was said in 1972 about the $800 million in the bill:

> At that time, the Secretary of Transportation told us that he could not even spend that money at that time; that there was not enough equipment that could have been bought to have used it up.

Did Representative Anderson know how much a rail system for Los Angeles would cost? No, he did not but added that he thought “we should first use separate bus lanes, and probably bring rail into the picture at a later date.” He added regarding the Los Angeles area:

> I feel we would be better served with bus transit for the immediate future, although we do have some areas, where years ago we did have a rail system, with many of those rights-of-way still there, and still unused, and perhaps could be picked up, and we have some of the rail companies, the big railroad companies, that have lines we could utilize for some type of a rail system. [*Federal-Aid Highway Act of 1973, S. 502*, p. 284-290]

AAA, American Trucking Associations, and the Highway Action Coalition

When AAA's turn came to testify on February 8, J. B. Creal, executive vice president, said in his formal statement that AAA had testified at length in May 1972. To save time, he would comment on the questions raised by Senator Bentsen in inviting witnesses.

Although generally supportive of S. 502, AAA found two provisions unacceptable. The first was the use of Highway Trust Fund revenue to purchase buses. AAA was supportive of mass transit, but "with less than 50 percent of the revenue in sight to carry out needed highway improvements, it is essential that each program continue to be funded as now provided by existing laws." Local jurisdictions could purchase buses with UMTA and General Revenue Sharing funds:

> If the public transportation crisis is as urgent as we have been led to believe, high on the cities' list of priorities should be the purchase of transit buses. They now have the funds to place many new buses in service.

Under the Federal-Aid Highway Act of 1970, highway users already were "doing a great deal for transit," not only providing the roadway on which 75 percent of public transit patrons ride, but preferential bus lanes, construction of parking lots and loading areas and shelters for transit users:

> Now the proposal is that the highway user pay for the vehicle itself! Will the highway user next be asked to pick up the tab for all or part of the fare?

S. 502, he added, called on the motorists to pay for equestrian trails and walking and biking paths, national forest fire control facilities, municipal parking lot bonds, and aid for the construction of toll roads, among other things:

> We don't believe that the American public wants its highway user taxes used for purposes other than providing a first-class highway system.

In May 1972, AAA had cited its member poll showing that 80 percent of respondents favored using gas taxes only for highways. Recent polling by AAA member clubs produced similar results:

> AAA believes that it is time we get back to basics. The Highway Trust Fund was established to provide the federal share of the costs of building our Primary, Secondary, and Urban highways, not just the Interstate System. The Interstate System was designated as part of the Primary System and a high priority was established for its early completion. Despite this, a thirteen-year program has stretched out to seventeen years and is likely to extend a quarter of a century if we don't resist all of these efforts to change the original concept of the Trust Fund. . . . If [highway user taxes] are not to be used for such purposes, then why should the tax be continued?

The second objectionable feature of S. 502 was the provision allowing a State to shift Interstate routes without regard to existing mileage limitations:

> AAA recommends that we adhere to the original limited mileage and needs formula concepts. If a state indicates its intention not to build a route, or a segment of a designated route, then the cost of the System in that state should be reduced in an amount equal to the cost of the uncompleted segment, based on the latest available cost estimate. But, under Sec. 111(c) of S. 502, it is proposed that if the new route costs less to build than that originally planned, the difference in cost may then be added to the apportionment of the urbanized area from which the withdrawn route or portions thereof were located.

Local officials, he said, seem to think they were entitled to Interstate funds even if they did not intend to use them to build an Interstate highway. AAA preferred the existing concept:

> If a state decides not to build a segment of the agreed-upon system, then . . . the cost of the entire system is reduced and that state's proportionate share of the cost of completion of the system is reduced.

In other matters, AAA said the authorization of $3.25 billion for the Interstate System was too low and should be increased to the former level of $4 billion a year in the interest of expeditious completion. AAA supported consolidation of categorical grants. "We believe that a large number of specifically authorized programs unnecessarily impede the individual highway departments." A functional realignment of roads among the Federal-aid primary, secondary, and urban systems to assure roads were assigned to the proper system would eliminate the need for transfers among systems.

Finally, AAA supported the priority primary routes "since it works toward the objective of placing our highway dollars to work on those roads where the traffic needs are the greatest." Focusing the funds on roads included in the 10,000-mile system "should bring maximum return on the dollars invested."

Senator Stafford began the brief question period by pointing out:

> Critics of the highway program claim that it is actually an incentive for the American public to buy more and more automobiles which calls for more and more miles of roads. They point out we are reaching a level of diminishing returns in our overuse of automobiles because of the problems of pollution, congestion, social dislocation, and so on.
>
> Is it your view that this country will have to rely less on the automobile in the future in order to solve some of the problems?

Creal was doubtful about the phrase "love of the automobile," and preferred to think people loved "their freedom of mobility" and do not want to give it up. "The problems "should be basically tackled one at a time, but not in a state of panic as one big problem, as we have heard from some areas."

Senator Bentsen wanted to clarify the provision of S. 502 regarding toll roads:

> I should point out that the toll roads in our bill can only be constructed once a State has exhausted all of its interstate funds. Also, the tolls must be applied to the State share of the project, that is paid off, then it becomes a free road. Now, does that appear fair to you?

Charles N. Brady, director of AAA's Highway Department, replied that "one of the reasons we object to this provision is the continuation of tolls." Highway users had been paying into the Highway Trust Fund "and yet what they wind up with is a toll road." AAA did like the provision that the toll road would become toll-free after bonds, with their interest payments, were retired.

Senator Bentsen explained that the provision was really intended for Louisiana "where the people feel the tax burden is such that they cannot handle this problem" without resorting to toll financing. The subcommittee "became convinced of the equity of it" and wanted to help build those roads at the earliest possible moment. Brady replied that given the long time needed to pay off bonds, S. 502 should extend the Highway Trust Fund for a 15-year period.

Did AAA believe, Senator Bentsen asked, that UMTA revenue was sufficient for mass transit facilities? Creal recommended that Congress follow the process that led to the Interstate System. First, study transit needs, then determine how to raise the money:

> It seems to us that mass transit is a pretty loosely used term, because some people think of it in terms of rail transit only. We are pretty well convinced that only five to seven communities will be able to use rail transit with any hope of economic feasibility.

Regarding AAA's hard line on diversion of Highway Trust Fund revenue, Senator Bentsen asked for AAA's views on using the revenue for highway safety programs such as replacement of railway crossings, pavement markers, and bridge replacement. Since such measures "are improvements to the highways themselves," AAA agreed that they were legitimate expenditures of Highway Trust Fund revenues.

The Senator pointed out the problem of inflation, the desire to avoid tax increases, and the need to cut spending. He noted AAA's recommendation to restore Interstate funding to $4 billion, but wanted to know if AAA would agree to reductions in view of those problems. No, Brady replied, AAA would not. "The highway program is funded out of the Highway Trust Fund, adding that to the extent funding is reduced, "the further you are slipping behind, and we are already, even at the $4 billion level, into the 1980's before we can finish this up."

Senator Bentsen emphasized "the whole spectrum of human concerns" facing the Congress and said that if we do not address them now, "I do not know when we will do it and therefore, as much as we want these things, some of these things, we are going to have to defer." Brady replied that the Highway Trust Fund was "a stabilizing type of operation, if it would be permitted to operate as it was intended." It had a predictable income and a well-known level of expenditures. If it had operated as intended, cost overruns would have been minimized and unit costs would not have fluctuated greatly but instead, Presidents "have been manipulating the funds through impounding and cutbacks." [*Federal-Aid Highway Act of 1973, S. 502*, p. 307-317]

On February 21, John de Lorenzi, managing director of AAA's Public and Government Relations, wrote to Senator Bentsen to say that AAA had not been given an opportunity to comment on the proposal to increase the gas tax by 1 cent to finance mass transportation "while numerous other organizations and spokesmen were." AAA was opposed because it "feels there is no basis in equity to single out all highway users as the tax source of support for mass transportation." Mass transit "is a responsibility of the general fund of the Treasury." [*Federal-Aid Highway Act of 1973, S. 502*, p. 318]

John Kramer also testified on February 8 on behalf of the Highway Action Coalition. The organization's chairman, Theodore Kheel, could not attend but submitted a statement for the record.

Kramer said the issue of how transportation should be financed, and especially the future of the Highway Trust Fund, was the central issue for the 1973 legislation in view of the plight of the Nation's mass and intercity transit systems:

> Since the establishment of the Highway Trust Fund in 1956, 268 transit systems have gone out of business, leaving millions of Americans with little or no access to public transportation of any kind. Most of the remaining systems are expensive to the rider and decrepit in service and operation.
>
> Only massive Federal aid will prevent many more transit systems from disappearing, much less assure quality service to the rider at a reasonable cost.

He cited the disparity between Federal spending for highways and transit:

> Last year highways consumed more than 60 percent of the total Federal transportation budget, as compared to mass transit's meager 6 percent.
>
> Including the revenues that local and State governments spent for road construction, maintenance, and safety, the total bill for our nation's highway systems came to $21.9 billion last year.
>
> This is a huge sum of money. It is not only vastly more than was spent on mass transit, but it is also more than the total Federal, State, and local government expenditures on housing, urban renewal, parks, recreation, sanitation, and police and fire protection combined.

The time had come to shift priorities from highways to transit and that, in turn, "will require making at least some Highway Trust Fund revenues available for public transportation."

The Highway Trust Fund, he explained, distorted local transportation priorities:

> Clearly, many localities and States have built highways because they had Federal funds to build those highways, and did not consider mass transit systems because they had inadequate funds to build and operate them. That was true whether or not the highways were the better solution to the locality's particular transportation problems.

He summarized his organization's priorities:

> Recognizing the urgency of the urban transportation problems and the lack of a single, simple solution, the Highway Action Coalition believes that the only viable policy is to increase the flexibility that local governments have in determining how Federal funds are to be used in their urban areas.
>
> Local elected officials must have the option of determining whatever mix of ground transportation modes will best meet their overall transportation needs, whether these needs be predominantly highway needs or transit needs.

He appreciated that S. 502 made Federal-aid urban system funds available for the purchase of buses, but the coalition was "sharply disappointed that S. 502 represents a retrenchment from the . . . bill of last year in that it makes appreciably less money available for the urban system." Coalition members also were disappointed that unlike the 1972 bill, S. 502 did not allow primary and secondary funds in rural areas to be used for rural bus programs.

The group "enthusiastically" endorsed the provision of S. 502 that gave State and local officials the option of using Interstate funds to satisfy other transportation needs instead of building a controversial Interstate segment. He recommended, however, that the Federal share for these substitute projects be changed to 90 percent "so as not to unduly prejudice local transportation decisions in favor of an otherwise unwanted Interstate project."

The Highway Action Coalition strongly supported the new Muskie-Baker bill and the Kennedy-Weicker bill, S. 679.

As for other elements of S. 502, Kramer endorsed the provision calling for annual transportation hearings and directing the Secretary of Transportation to issue guidelines to increase citizen participation in the transportation planning process. He also endorsed the pass-through provision as "a crucial step." The provisions of the Kennedy-Weicker bill encouraging States to form transportation departments and making highway revenues available for public transportation were "important and desirable innovations."

Members of the coalition were concerned that NEPA, Section 4(f), and other safeguards not be "undermined, and that citizens continue to have recourse to the courts, when Federal and State officials violate these important laws." In particular, the coalition opposed environmental exemptions for specific projects, such as the North Expressway in San Antonio:

> We understand that an effort may be made to similarly exempt the Overton Park Expressway in Memphis, Tenn., and Interstate Route 66 in Arlington, Va., from the environmental protection statutes.

He urged the committee to include "measures to deal with the problem of automobile-related air pollution and the need to conserve our increasingly scarce petroleum resources." For this purpose, he endorsed Senator Muskie's proposed amendments to S. 502 providing emergency transit assistance to cities having difficulty meeting Federal ambient air quality standards, establishing mandatory auto emissions inspection programs, and prohibiting new highway construction that might cause air pollution levels to exceed Federal limits.

During the question period, Senator Bentsen objected to the implication that "construction of rapid rail transit does not also result in some substantial economic, environmental and social damages." Kramer acknowledged that it can:

> Living within 20 feet of a Metro station, where there is construction at 7:30 in the morning, I can attest to some of the damage, at least in the form of noise pollution that mass transit can cause, and on a serious note, I think it is important that these various environmental protection statutes also extend to mass transit.

However, looking at overall environmental impacts, "there can be little doubt as to which is the more environmentally preferable."

Senator Bentsen's final question concerned operating subsidies, which the committee had supported in 1972, but that Secretary Brinegar said he opposed. Kramer replied, "No question but that operating assistance is perhaps the No. 1 priority of public transportation." He shared some of Secretary Brinegar's doubts about assuring subsidies do not undermine quality service and admitted that "we are a little bit nervous about some of these proposals currently before the Senate." However, if that was the best that was possible, the Highway Action Coalition could live with it. [*Federal-Aid Highway Act of 1973, S. 502*, p. 320-328]

William A. Bresnhan, president of American Trucking Associations, began his testimony by recalling creation of the Highway Trust Fund in the Federal-Aid Highway Act of 1956:

> We supported the program in 1956, but with a degree of reluctance because we feared the very thing that is happening now. We felt in our bones that before the program was completed there would be an effort to divert large parts of the money to other purposes. The variety of proposals to divert substantial sums of money for other purposes are particularly unfair to the trucking industry.

He listed the taxes paid by truckers:

> We agreed in 1956 to pay these taxes for as long as the people and the Congress felt there was need for the money for the construction of highways. We have been faithful in keeping our end of the bargain, and did not come up here asking repeal of the excise taxes when they were repealed a couple of years ago for automobiles and commercial vehicles weighing less than 10,000 pounds.

If Congress was going to stop or curtail the Federal program, it should also stop or curtail the special highway-user taxes.

His organization supported mass transit, including a fund for it, and was willing "to pay our share of any across-the board taxes that apply to all businesses and industry to finance such a program." He continued:

> But we think it is unfair to single out one industry to bear the brunt of taxation to tackle a problem like mass transit which should be the responsibility of everyone.

Bresnahan also addressed the size-and-weight issue affecting operation of trucks. The 1956 Act, he said, contained size-and-weight limits for the Interstate System that the States could ignore only if they were willing to forgo Interstate construction funds. Those limits were temporary, pending completion of a study conceived by AASHO, BPR, and the Highway Research Board, to measure the effect of size and weight variations on pavements and bridges. That study, known as the AASHO Road Test, resulted in recommendations for changing the limits.

The Johnson Administration supported a legislative change and the Senate approved the new limits in 1967. However, the House had not voted on the proposal after "distorted and misleading attacks" on the bill. Although eight western States had changed their legal limits in accordance with AASHO's revised standards, "they still cannot permit them on the Federal Interstate System—the best roads in the world—without losing their funds for completion of the Interstate System." He urged Congress to repeal the standards in the 1956 Act or increase them "to more realistic levels." (For information on the AASHO Road Test, see (http://www.fhwa.dot.gov/infrastructure/50aasho.cfm).

In response to a question from Senator Bentsen, Bresnhan said that his organization did not object to bus lanes, but "we regret the need to object to the acquisition of buses." The best he could say for it was that other proposals, such as making 50 percent of Federal-aid highway funding flexible, were worse. He saw "no reason why buses should be paid for out of the trust fund."

Senator Bentsen asked if American Trucking Associations would consider a 1 cent tax on gasoline to support mass transit as the type of across-the-board tax Bresnahan mentioned:

> Not really, because that is just another highway tax . . . . I am not recommending this, but it would be fairer and more tolerable for example if there was a 1-cent gasoline tax on all fuel, including, not only that used by trucks and automobiles, but airplanes, water carriers, and railroads, but even if you did that, you would be narrowing down the responsibility to a degree that we do not think it should be.

Was Bresnahan satisfied with Secretary Brinegar's comment that since truckers pay highway user taxes, "it is reasonable that those funds be directed to the special use, namely, that of meeting the extra cost of building highways to meet truckers' needs." Bresnahan replied, "No; not at all" and continued:

> [It] is one thing to talk about fair share, and charging the trucks more, because it costs more to build highways for trucks, when all the money goes for highways, but when you talk

> about spending a billion or $2 billion on transit, in our view, the whole issue of fair share goes out the window.

In response to a question from Senator Domenici, Bresnahan commented on the Secretary's view that since highway user taxes prior to 1956 went to the general Treasury, taking 20 or 25 percent out of the fund for transit was not objectionable. Bresnahan agreed with the Secretary's facts, saying, "Well, that is true, but in effect, he is saying to go back to an injustice that existed before 1956, and apply it again . . . ."

Senator Randolph closed out the questioning by noting that Senator Clifford P. Hansen (R-Wy.) was going to introduce a bill to repeal the size and weight limitations on Interstate highways. [*Federal-Aid Highway Act of 1973, S. 502*, p. 351-357]

To end the day's hearing, Senator Bentsen had scheduled witnesses to discuss his bill's Section 147, the provision that eliminated the Federal role in the North Expressway project through Brackenridge-Olmos Basin Parklands in San Antonio. The initial panel included Anthony Athens, Jr., chairman of the Sierra Club, South Texas Group, and Boone Powell, architect.

Athens began by saying the special exemption for the North Expressway "would set a dangerous precedent weakening vital environmental safeguards" while the road as planned "would seriously degrade the major urban park and open space system of San Antonio." In fact, the road would be "a disaster" for the park. In view of court victories thus far, intervention by Congress was "inappropriate and unnecessary." He credited Congress for "genuine environmental awareness" in passing the laws, NEPA and 4(f) in particular, that it now wanted to eliminate compliance with for this one project.

Exempting this project "may well open a Pandora's box of requests for similar exemptions from across the Nation wherever crudely planned and environmentally damaging projects have been the source of controversy." Athens estimated that any one of the 50 or so controversial road projects could be "candidates for tomorrow's pleas to the Congress for special exclusion." The issue, therefore, was not just about what the citizens of San Antonio want, "but rather a question of the continuing wholeness of the environmental safeguards which were the broad intent of Congress." Eroding these safeguards risked letting them be "eroded into oblivion."

The North Expressway was "a dinosaur of the roadbuilding concept," conceived 30 years earlier before people saw "the untrammeled use of automobiles destroying and distorting our cities, befouling our air, squandering our resources, and giving us inefficient transportation in the bargain." As an example of changing attitudes, he cited EPA's requirement of strategies to reduce urban automobile use, including moratoriums on free construction and increased reliance on public transit. "Advocacy of such a project without full study of alternatives is, we believe, the worst form of environmental folly, and one which the Congress should not encourage."

Powell, an architect living in San Antonio, discussed some of the city's charms as well as earlier historic preservation battles, such as a 1930's State plan to put a highway through the grounds of historic Mission San Jose. The mission was saved and was now a national monument. He also described the park and its many features:

> In conclusion, there are numerous reasons why the special legislation for San Antonio should not be enacted. Two successive Secretaries of Transportation have refused to approve the route proposed by Texas; the Federal court, in an exhaustive opinion, held that Federal laws had not been followed; the legislation has been opposed by all Federal agencies with expertise in the area—the Department of Transportation, the Council on Environmental Quality, and the Environmental Protection Agency.

The issues could be resolved through completion of the environmental impact statement without congressional action.

Senator Bentsen acknowledged the "sincerity and good will on the part of both sides" of the controversy. He noted, however, that EPA had calculated that by 1990, the expressway would substantially reduce air pollution in the area of the park due to more efficient traffic movement. Athens replied that in his opinion, "that is a thesis which remains to be proven."

The Senator pointed out that parks officials supported the expressway, including the director of parks and recreation and the San Antonio Zoological Society. Athens could not speak for those officials, but his own observation was that "it will very, very well do decided damage to the park, and all of the potential of the park cutting it in such small pieces."

Senator Bentsen disputed the statement that the case was not unique and would set a bad precedent:

> It is the only case in America which I know of in which the people have been denied their right to build a highway within the boundaries of their own State, with their money, for their own use.

That concluded his time without a response to his statement.

Senator Buckley, who opposed the exception for the North Expressway, observed that he had over a dozen cousins and aunts living in San Antonio "and not a single one of them has lobbied me one way or the other." (Senator Bentsen observed, "Considering your position, I wish they had.") He wanted to know if the Texas Highway Department had taken any steps to comply with the court's August 1971 decision. "Not that we are aware of," Powell replied. How long would compliance take? Powell estimated 18 months.

If the Texas Highway Department returned the Federal-aid funds used on the expressway as envisioned in Section 147, Senator Buckley asked, would the recaptured funds remain available to Texas. Powell explained his understanding that the repayment was "a mere shift in bookkeeping" that would not affect the amount of Federal-aid highway funding available to Texas.

Finally, Senator Buckley asked if the State had made any effort to comply with Section 4(f). No, Athens explained, because the State claimed that since it had applied for funding before enactment of the Department of Transportation Act of 1966, it was not bound by the provision requiring consideration of all "feasible and prudent" alternatives before approval of the taking of parkland for a Federal-aid highway project. [*Federal-Aid Highway Act of 1973, S. 502*, p. 372-379]

Sam McDaniel of the Texas Highway Department and Frank A. Bennack, Jr., publisher of the *San Antonio Light* newspaper, testified in support of the North Expressway. He explained that the project was a local issue. The city of San Antonio had proposed the project, located it through the park, and asked the State to build it. He displayed a map showing the route "in light of the 'First Tuesday' program the other night on NBC . . . ." He did not question the sincerity of those who opposed use of the park, whom he characterized as "quite affluent, some of them," but added, "There is not much controversy over the fact that the expressway is needed, and any alignment which avoids this basin will displace over 1,000 families, not people, but families, by either going to the east or west to avoid the basin area."

What created the controversy was the State's decision to use Federal-aid for the project and then to not withdraw from Federal-aid soon enough. The State was bound by its agreement with the city to build this road "whether or not it is approved for Federal aid, because this is what the people of San Antonio want."

McDaniel tried to address the earlier question about how long compliance with Federal-aid requirements would take. The State could complete the environmental impact statement "without a terrible amount of delay" but that was "merely the first step in the procedure . . . ." Having already worked on the project for 9 years, the State would need around 5 more years to complete the review process.

Bennack explained that he was appearing before the subcommittee as a citizen representing groups favoring the expressway. He provided some of the history, such as the 1961 referendum in which residents approved a bond issue, 2 to 1, and how FHWA had approved the route 9 years ago before Section 4(f) and NEPA. He added that in 1971, after years of controversy, "the community still was able in a very short time to get 103,000 people to sign the petition that they wanted this project completed."

Senator Bentsen asked Bennack how many elected city officials supported the project. Bennack replied that, "I believe it would not be stretching a point to say it is almost unanimous."

Senator Buckley said he was curious why the State had decided to ask for Federal-aid for the project in the first place. McDaniel simply stated that the project was routinely scheduled for Federal-aid. When opposition arose, the State "felt it would not be proper to change it just because there was controversy," especially since the State thought it could repay the Federal-aid funds and proceed with State funds if it did not agree with the Secretary of Transportation's decision.

After the District Court allowed the project to proceed, the State and Secretary entered into an agreement "that the Secretary would agree to the end sections, if the [Texas Highway] commission would agree that unless the Secretary approved the middle section [through the park], no Federal funds would go into the end sections either, and that any funds that got into the end sections prior to the decision on the middle section, would be refunded to the Secretary." Construction began on that basis, but the Appeals Court ruled that the project had not been properly reviewed and returned it to the District Court. They could continue through the courts to secure approval to de-Federalize the project, but "we feel that the people of San Antonio need this expressway, and that they will get it much, much quicker, if we can get the Congress to turn it loose."

Senator Buckley said, "What I am concerned with is the principle, whether the Congress should be legislating to overturn a court decision, and what the impact of this legislation will have on the integrity of the environmental laws." McDaniel did not believe such an action would set a precedent for other controversial projects:

> I think it is the only case in which all of the right-of-way acquisition had been made, and the route approval had been given, prior to the effective date of either one of the statutes, and all of that had been done with local funds, no Federal funds whatsoever were involved.

Other controversial projects such as I-66 in northern Virginia "are cases in which you are talking about clearly Federal projects, and many of them are interstate projects, and you are not talking about a project where the city originally asked for it and its people voted for it."

When Senator Buckley asked if Texas would be willing to forgo $1.8 million in Federal funds, Senator Bentsen pointed out that under Section 147, the funds would be credited to the unprogrammed balance of Federal-aid funds for the category they came from, "but it is my understanding from counsel that it does not go back to Texas, that they lose that allocation, whereas the House bill provided it did go back to Texas." Senator Buckley said he was still not satisfied.

Senator Bentsen concluded this portion of the hearing, and the day's sessions, by saying, "I hope the day never comes when Congress will not be willing to judge a particular situation on its merits, or listen to local people . . . ." [*Federal-Aid Highway Act of 1973, S. 502*, p. 449-457]

Following 2 days of hearings, *Engineering News-Record* said that the "battle to shape a new highway bill has reopened on Capitol Hill with little sign [of] an impending compromise." Instead, the hearings "saw old antagonists reiterate familiar positions . . . ." After a brief comparison of Secretary Brinegar's proposal and the Kennedy-Weicker bill, the magazine's Washington Observer concluded:

> Although the highway battle promises to be a protracted fight, Administration sources say they are confident of prevailing in the Senate. The crunch will come in the House, which last year refused to go along with Senate-passed legislation to tap $800 million in trust fund money for optional spending. ["Highway Fund Battle Recurs Over Urban Spending," Washington Observer, *Engineering News-Record*, February 15, 1973, p. 7]

The hearings triggered editorials around the country. The *Baltimore Sun*, which was still chronicling the long-running controversies over the city's Interstate connections, began an editorial: "There is a good chance this year that Congress will agree to tap a sacred cow, the Highway Trust Fund, so some of the $6 billion in it can be used for mass transit." The possible limitation of funds to the purchase of buses was "fine—as far as it goes. But such a restriction would do nothing to repair deteriorating train service or build needed new transit systems." The newspaper was hesitant about the proposal to increase the gas tax by a penny for mass transit. "In effect, such a step would leave the brimming fund intact." The Eisenhower plan for the Interstate System was "a resounding success," but the "urgent need now is for improved mass transportation serving urban areas." Still, the highway lobby was strong:

> It seems evident, therefore, that the price of improving mass transportation facilities includes eagle-eyed vigilance by the public, while the bill is being drawn up and when Congress votes on it. ["Don't Blink," *The Baltimore Sun*, February 8, 1973]

The *Birmingham News* thought the Highway Trust Fund "is the logical source of funds with which to provide alternatives to the automobile." Diversion was sound for several reasons:

> It would reduce pollution. It would help preserve urban land being consumed by more and more highways. It would reduce costs of transportation to individuals and help reduce the need for more and more highway construction. It would help relieve urban vehicular congestion. It would require less energy be used by moving more people more efficiently.

There was no reason why details could not be worked out "to shift some of the focus from highway construction toward total transportation systems." This was essential because, "Making it possible for even more cars to pour into the cities over new highways only adds to the problems." ["To Aid Mass Transit," *Birmingham News*, February 10, 1973]

The *Cleveland Plain Dealer*, which also supported diversion, hoped proponents were right that chances were better in 1973 than they had been in 1972:

> We believe the American public will benefit from the better-balanced transportation system that would be made possible by diverting some highway construction money into bus or rail transit in auto-choked urban areas.

After endorsing the Kennedy-Weicker bill, the *Plain Dealer* acknowledged that there "may be an element of inequity in expecting highway users to help pay for mass transit." However, "it is no more inequitable than having the general public, through its taxes, support railroads, or aviation, or barge or ship transportation." This was especially true since highway users would benefit by improved mass transportation that could help relieve congestion. ["Use Road Funds for Mass Transit," *Cleveland Plain Dealer*, February 10, 1973]

The *Milwaukee Sentinel* said that Secretary Brinegar's proposed to tap the Highway Trust Fund for mass transit "is an indication of another idea whose time has come." The highway lobby, the editorial stated, could no longer "fend off reasonable approaches for spreading around the gasoline tax money which feeds the fund." Operating expenses should remain a State and local responsibility, while mass transit advocates and environmentalists would be well advised to "temper their zeal with a more responsible attitude toward basic highway needs." The effort to kill Milwaukee County's freeway system was "an example of misused zeal." The editorial encouraged all parties to "start working together in a common cause." ["Tap the Fund," *Milwaukee Sentinel*, February 12, 1973]

The *New Orleans States Item* thought that reasons "for opening the enormous highway fund to other modes of transportation become more compelling with each passing year." The usual argument, that mass transit would relieve traffic congestion, was valid, but a new problem also should be considered. "In contemplating the national energy problem, Congress might view the efforts to channel highway funds into mass transit systems in a new light." ["Energy and Mass Transit," *New Orleans States Item*, February 13, 1973]

An editorial in the *Tucson Citizen* reported that when Phoenix Mayor John Driggs, who supported construction of a 200-mile freeway system, announced that he opposed diversion of Highway Trust Fund revenue to mass transit, Citizens for Mass Transit—Against Freeways took "strong exception." The group did not want to "follow in the footsteps of sprawling, ugly, smog-ridden Los Angeles." The editorial agreed with the group that "Freeways are not the answer in Phoenix anymore than they have been in Los Angeles or would be in Tucson." For years, the highway lobby had "succeeded in keeping a lock on the Highway Trust Fund." Now, it was "time that lock was picked, and the legislation introduced in Congress could just do it." ["Break the Trust," *Tucson Citizen*, February 13, 1973]

President Nixon was more determined than ever, according to the *Pittsburgh Press*'s editorial, to make Highway Trust Fund revenue available "for buses, commuter trains, and other mass transit projects." Secretary Brinegar's proposal, plus the $1 billion a year available through UMTA "could give hard-pressed rail and bus systems the funds to upgrade their service." Highway boosters thought highway user revenue should be used only for highways. "But tax money should be spent where the need is greatest—and the need for clean, fast commuter systems is far greater at the moment than the need for new roads." The editorial quoted Cincinnati Mayor Theodore M. Berry who had said the only alternative to improved mass transit is "more highways, more cars, more pollution." That alternative, the editorial stated, "cities would do well to avoid." ["Nixon and Mass Transit," *Pittsburgh Press*, February 16, 1973]

Governor Sargent

When the Subcommittee on Transportation returned on February 15 for a third day of hearings, Governor Sargent was the first witness. He was participating as Governor of Massachusetts but also as a representative of the National Governors' Conference, which he served as chairman of its Committee on Commerce, Transportation, and Technology.

He began by saying the pending legislation "holds immense significance" and its impact "will be felt for decades to come, and into the next century." With that in mind, he said, the Governors "feel that the day has come when the Federal Highway [sic] must be broadened." It must allow flexibility so that each State is allowed to meet its transportation needs in its own way.

The country was justifiably proud of its "magnificent highway network," but when those highways moved into the cities, they "began to tear up neighborhoods, uproot families, and displace industry." Commuters abandoned the buses and trains and "they now clog our expressways every morning and every evening." The "inescapable conclusion" was that highways alone "cannot meet the transportation needs of some of our urban areas."

The National Governors' Conference recognized the need for more rural roads, but "certain metropolitan areas have exhausted the potential of expressways." Those areas should be given "the full capacity to create a more balanced system to reflect their specific needs." That was not the case under current law:

> Today the Federal Government pours dollar after dollar into a State which builds highways. As a result, there is enormous pressure on a governor of an urban State to build more and more highways.
>
> And it is no easy task to refuse.
>
> So what the Congress must do is to change the system. You must, in my view, modify the highway trust fund to allow greater flexibility.

Governor Sargent said a panel of State Secretaries of Transportation, including Secretary Altshuler, would be testifying later and could address the technical details of the proposals under consideration. The National Governors' Conference supported the proposals Secretary Brinegar had presented, but he would limit himself to a couple of suggestions, starting with the Interstate transfer provision. It would greatly ease the burdens on some States that would no longer be "shackled to outdated plans that were designed for an earlier age":

> The Governors' conference [sic] believes that the Congress should allow the State to refuse the highway but still retain the money. It should allow the State to transfer such funds to either a different highway construction project or to mass transit, rail or bus.

At the same time, the conference opposed the pass-through that would bypass State governments in the allocation of money. The intention to involve local communities in the highway program was good, he said, but "the means are questionable":

> By giving money to both the communities and the State you will be splitting the two apart. With an independent source of revenue, each will march off in its own direction. And any hopes for comprehensive statewide planning will be lost.

Governor Sargent broadened his subject to the looming energy crisis the country was facing. The country needed new energy sources but in the meantime "must make better use of what energy resources we now have." He cited a study by Chase Manhattan Bank concluding that "passenger cars alone burn 40 million barrels of oil a day," representing 30 percent of total daily use. He also cited a floor speech in which Representative John Anderson pointed out that in urban areas, automobiles use twice as much gasoline per passenger mile as transit buses, four times as much as commuter buses, and seven times as much as commuter rail.

He also pointed out the environmental crisis that EPA had so clearly documented in finding that as many as 28 cities would be unable to meet ambient air quality standards by 1977. “And they will fall short because we now rely too heavily on the automobile for urban city travel.” Automobiles, he said, produced two-thirds of all carbon monoxide emissions, more than 50 percent of hydrocarbons, and two-fifths of nitrogen oxide. “In comparison, the pollutants left by the other forms of transportation are negligible.”

For these reasons, the day had passed “when the automobile can travel unrestricted through our central cities.” The time had come to revise the Highway Trust Fund to give each State the flexibility to create the transportation network it needed. While we should take pride in our highway network, it was at the same time choking urban areas, paving through neighborhoods, displacing families, and fouling the air. “And the irony is that we did not intend to do this in the first place. It was an oversight, a mistake.” Now was the time to correct the mistake:

> I hope, in my view, that you will revise the highway trust fund. I hope you will let each State meet its own transportation needs in its own way. [*Federal-Aid Highway Act of 1973, S. 502*, p. 484-488]

Senator Bentsen noted the endorsement by the National Governors’ Conference of diversion of highway revenue to transit but pointed out that Governor Robert Docking of Kansas said on February 7 that, “The Highway Trust Fund should be preserved for the purpose it was intended, to build the Interstate highway system, and to make improvements to other Federal aid highway systems.” Did this not reflect division among the Governors?

Governor Sargent explained that when he first raised the idea before the conference of using Highway Trust Fund revenues for mass transit, “it got nowhere.” Each year, however, support for flexibility grew “and at the last meeting, there was a clear vote on the part of the Governors to support this concept.” Even Governors from rural States that wanted more highways, not mass transit, supported the concept when they understood that their States would not be short changed. As with most witnesses, Senator Bentsen asked the Governor about funding options for transit, including the 1-cent gas tax increase. With $5 billion over 5 years from the increase plus the commitment of UMTA funds, “do you think that would support that?” Governor Sargent said he was primarily interested in “the matter of flexibility of the highway trust fund.” An additional penny a gallon “would provide that additional flexibility.” To provide sufficient funds for mass transit, “I would not say let us cut out the funds by any stretch of the imagination, but I would like to feel that the States would have this flexibility with the use of the highway trust fund.”

Regarding the pass-through that the Governors opposed, Senator Bentsen asked, “Would not that increase the flexibility?” The Governors, Sargent said, “feel that it is important to channel these funds through the Governors of the 50 States” and they can work with local officials, as had happened in the Boston area, to decide the best mix of projects.

Did Governor Sargent have an opinion on whether metropolitan areas of 250,000 population, as in S. 502, or 400,000, as Secretary Brinegar had proposed, could best determine how the funds should be spent? Governor Sargent did not express a preference. Instead, he replied, “I think that the State has got to look to the overall plan, the overall planning, the comprehensive planning for a balanced transportation system of the State."

Senator Stafford wanted to clarify whether Governor Sargent meant that the Interstate transfer provision should allow the funds to be used within the State or another State such as Stafford's own Vermont. Governor Sargent replied that like other States, Massachusetts had plans "that were prepared 20 years ago, that we have determined cannot be continued":

> We would like to be able to transfer those dollars to our projects that made more sense, in the light of the problems that we created by this great commuter crush that we have . . . . We love Vermont, but we need our Massachusetts money in Massachusetts.

Since the pass-through provision would leave Boston decisions to Boston officials, Senator Stafford asked how Federal-aid urban system funding under the Muskie-Baker amendment might be spent in the area. "Would most of it still go to roads, or would half of it go to buses and rapid transit?" Governor Sargent did not want to predict a percentage, but after summarizing the Interstate highways he had halted, he said:

> We have decided that to do that would really be disastrous to the entire metropolitan Boston area. We would like to not build it, in fact, we are not going to build that, but what we would like to do is to have a large infusion of funds, to meet and to construct rapid transit, and to update on [sic] buses, and to modernize our system, use it for capital improvements, that we would consider we would use quite a percent of those funds for that purpose.

He would include rail mass transit systems. "I personally think that we should have the broadest range of possibilities so that you truly can have a balanced transportation system."

Senator Stafford also wanted the Governor's view on whether the Governor, the State department of transportation, or the highway department should be responsible for long-range transportation planning. Governor Sargent thought that States with a department of transportation should let the department handle long-range planning, but in States without such a department, the Governor should be responsible.

Senator Domenici said that as a former Mayor, he had come to a simple conclusion. "I have concluded that the greatest problem we have in our country is piling people on top of each other, and then trying to undo the social entanglements." He thought it might be better to move people out, "even if it were called sprawl," than try to solve city problems. As a new Senator, he found that "people are saying, let us experiment thoroughly with a program of any magnitude before we commit our country to it." He did not want to support something in the 1970s only to have people look back 20 years later and "then say that was wrong." He asked Governor Sargent:

> So, I wonder if you have an opinion as to whether we know enough about the interrelation of the problem of why people use cars, will they use mass transit, will it really have any more of an impact on the total problem than trying to complete in the best way we can a system of highways that at least we know something about, and address ourselves to a true,

> true feasibility experiment of some magnitude with the total problem of moving people in a manner called mass transit.

The Governor said that as for sprawl, "I think we can all agree that planning used to be a dirty word," but it is desperately needed now because "we should be doing the planning rather than having the developer do the planning for us . . . ." He did not think that in the 1950s, when the cities clamored for Interstate highways, "we thought we would be setting up a system used by commuters a good deal, so we have created some problems." In Boston, with its antiquated subway system, he was "very encouraged to find that the use of this is increasing tremendously," including a new line that is computer run:

> I think that people, if they find they can have rapid transit that is clean, that is efficient, that is on time, they will use it, but certainly Americans have had a love affair with the automobile, and people like to be able to have that flexibility, being able to go whenever they want, wherever they want.

In response to questions from Senator Scott, Governor Sargent explained that he planned to expand mass transit in the Boston area to include additional lines and new computerized equipment. He was using revenue from State bond issues and funding from UMTA.

The Senator and the Governor then engaged in a colloquy that went to the heart of the matter:

> Senator Scott. Is it your feeling that the people who use the highways should pay for mass transit?
> Governor Sargent. Yes; I believe, for example, in my State, that we would be much better off and all of the people would be better off if they used mass transit.
> Senator Scott. Are you going to make the people use mass transit, whether they want to or not?
> Governor Sargent. We are going to try to persuade them to by having a good system.
> Senator Scott. Do you take it upon yourself to tell the people what is best for them, because you are the Governor of the State of Massachusetts? Don't we live in a democratic society, where we have freedom, and where people should decide such things as this for themselves? Is this not a big brother type of approach?
> Governor Sargent. I think that the people want to have a balanced system. I think they want to have alternative ways of doing things, and I am not saying, Senator, that a rural State should lose any money at all for highways. I am just saying that I think that an urban State should have flexibility in usage.
> Senator Scott. Would it be reasonable to complete the Interstate System before we start diverting funds out of that system and weakening it for mass transit and other purposes.
> Governor Sargent. Mr. Chairman, I very strongly feel that we should finish the Interstate System.
> Senator Scott. Before we take any money out of it for the other purposes?
> Governor Sargent. Well. I think for instance in our State, and I was faced with this problem of some 20-year old plans that were there, that would have torn through the city, and so on, and we said no, we are not going to build those facilities, we said that we should use some

> of those funds for mass transit. That does not mean that we are not going to complete the Interstate System. I think that we should complete the Interstate System nationally, I think we should complete it in Massachusetts?
> Senator Scott. Before we divert funds?
> Governor Sargent. I do not think we should, however, say we are going to go forward with that 20-year old plan that would ruin the city of Boston and Cambridge and so on just because the plans are there.

Senator Scott, a native of Williamsburg, Virginia, then became nostalgic, recalling the small community where he grew up. He said, "we did have mass transit, we had street cars that ran from one little community to another, they are all gone now," adding, "I cannot help wondering what happened to the street cars." Like Senator Domenici, he wondered what would happen in 20 years, but he could not "understand such a thing as stopping beltways."

The final questioner was Senator Randolph. Regarding the Governor's endorsement of Secretary Brinegar's proposals, he asked, "Are you aware we do not have them?" Governor Sargent said he was not aware of the details, but based his comments on the Secretary's statement. Senator Randolph added, "The members of the committee are awaiting those details, which we hope will be brought to us as soon as possible."

Senator Randolph pointed out that he had tried to "pass a bill to be resourceful and creative and come out of the straightjacket in which we found ourselves, to encourage uses of bus lanes, and many other innovative matters in connection with the movement of people." The bill had failed in 1972, but "sometimes we have a feeling that some of the witnesses do not want to really give credit for that which has been done." He wanted to clarify Governor Sargent's concern about the pass-through provision of S. 502. Regarding community participation, did the Governor mean determining whether rail or some other form of transportation would be pursued rather than the use of highways? Governor Sargent confirmed:

> I could be accused of being a Governor, and therefore I feel that way, but I think the funds should go through the Governor, so he could be concerned with the overall transportation planning, to try to have a balanced system, rather than having it go directly to the cities and towns.

The same applied to the use of Federal-aid urban funds. "We have set up machinery to work with the communities on this, but we would want to be sure again that this was part of an overall comprehensive plan for the entire State."

The Senator explained that the Interstate routes were included in the Interstate System to meet a transportation need. If that need no longer existed, "then how can an obligation be imposed on the trust fund?" Confused by the question, Governor Sargent said he would go back to the issue of flexibility. "It seems to me that a Governor and his secretary of transportation in a State can make the wisest decisions regarding his State." [*Federal-Aid Highway Act of 1973, S. 502*, p. 488-497]

More Familiar Voices

Dr. Ronan of the Institute for Rapid Transit and MTA testified next. He explained that MTA was expanding the New York City subway system, redeveloping suburban railroads, and operating suburban bus routes. It also had been authorized to build a highway bridge crossing over Long Island Sound:

> The proposed Rye-Oyster Bay Bridge, to be connected into Interstate highways 95 and 287, will vastly improve access by automobile, bus and truck between Long Island and the mainland.

In his multiple capacities, he opposed Section 130 of S. 502 on "Urban Highway Public Transportation" if it restricted funding to mass transit systems other than rail. As such, he said, "the bill would have the effect of discouraging the transportation of passengers within urban areas by rail." He did not believe that such an outcome "would be in the national interest for a variety of reasons, including economics, air pollution control, and the need to conserve energy." He added that whether a metropolitan area would be better served by bus or fixed rail "should not be predetermined by Federal statute." The past 20 years had shown that if the legislation did not allow the use of Highway Trust Fund revenue for rail mass transit, "there would be a strong inducement for State and local governments to opt for highways just to get the Federal financing to do something about their problems."

He also was concerned about the definition of metropolitan transportation agencies in the section of S. 502 on availability of Federal-aid urban funds:

> As presently defined in the bill, a metropolitan transportation agency must have the power to engage in highway construction to qualify for assistance. This would eliminate most of the publicly owned urban transit systems in the country as grant recipients.
>
> We believe that the bill's definition of areawide metropolitan transportation agencies should be modified to permit funds to be made available directly to governmental bodies that have been duly authorized to construct and operate urban public transportation services. [*Federal-Aid Highway Act of 1973, S. 502*, p. 498-502]

Daniel Mikesell, supervisor of San Bernardino County, California, and other county officials represented the National Association of Counties (NACo) before the subcommittee. Mikesell, who chaired NACo's Steering Committee, explained that county officials were responsible for 67 percent of the Nation's roads, or about 2.3 million miles out of 3.8 million miles. "Most of the Federal aid secondary system, as well as the urban system [designated] under the 1970 act, is under county control." With that in mind, NACo supported the reduced authorization level for the Interstate System in S. 502 because it meant "the backlog needs of other systems will be given increased money." He urged that Congress authorize at least $2 billion for non-Interstate roads.

NACo opposed the use of Highway Trust Fund revenue for mass transit. For several years, it had recommended creation of a separate Mass Transit Trust Fund, with the full amount of Highway

Trust Fund revenues reserved for highways through 1977 without cutbacks or delays. "While the establishment of a trust fund does not come under the jurisdiction of this committee, the establishment of such a fund might change your approach to providing funds for public transportation."

With that distinction in mind, NACo supported the proposed increase in contract authority for mass transit, from $3.1 billion to $6.1 billion as well as funds for operating subsidies.

In addition, NACo opposed the pass-through provision:

> These metropolitan agencies do not now have the authority or power to develop and implement the plan. Nor is it likely that this authority or power will be provided by State, county, and city officials in the foreseeable future.
>
> We also are not convinced that such a provision would necessarily give local governments more flexibility and control over funding. State governments would still control the distribution of other State road assistance, a major part of outside funding for local governments in many States, in addition to the large expenditure of State funds on major roads within the State.

NACo favored retention of the funding categories for the Federal-aid highway systems, but reduction of the special purpose programs. Once these programs had focused attention on the area in question, such as TOPICS, bridge replacement, or railroad-highway grade crossing safety, they should be folded into one of the basic categories.

The Interstate transfer and substitution provisions in S. 502 were generally acceptable to NACo. However, the funds resulting from a withdrawal should be used only on the Interstate System, not the other Federal-aid systems. If the State could not use the funds, the funds should be retained in the Highway Trust Fund and the total cost of completing the Interstate System should be reduced.

NACO had serious reservations about the proposed 10,000-mile priority primary system. The cost of these routes "would be better used for needed improvements on he other non-Interstate System—primary, secondary, urban, and urban extensions."

During a brief question period, Senator Stafford pointed out that while NACo favored reduced authorizations for the Interstate System, most other witnesses favored completing the network as soon as possible. Mikesell explained that given the tremendous amount of mileage that needed upgrading in the country, "we are not able to cope with the conditions of the roads or the traffic they now bear." He added that "we are so behind in bringing these roads up to standard, that we feel that some slight reduction in the interstate, it would not be adverse to the public interest."

Senator Stafford asked if NACo would support a 1-cent gas tax increase for urban mass transit systems. NACo had not taken a position on how to fund a Mass Transit Trust Fund, but Mikesell suggested an excise tax on automobiles as "a source that is not being tapped now, and oftentimes they blame automobiles for the terrible conditions of our Nation, and maybe it would reduce the sale" of the vehicles. [*Federal-Aid Highway Act of 1973, S. 502*, p. 510-515]

As in the past, former Deputy Federal Highway Administrator D. Grant Mickle represented HUFSAM. In response to the questions submitted to all witnesses, Mickle stated that the documented need for highways and safety improvements is "so huge that total highway and safety authorizations should fully utilize highway trust fund income."

He recommended consolidated categorical programs because the present array "increasingly hampered management by the States and cities." He favored a functional reclassification of roads to align them better with the goals of the Federal-aid primary, secondary, and urban systems. As a result of such a reclassification, a new priority primary network would not be needed since the routes would be classified as principal arterials and included in the Federal-aid primary system. "Within a state's own improvement priority system, such routes could be given precedence." He recommended eliminating the Special Urban High Density Program, the proposed Rural Public Transportation Program, and other special systems and categorical programs. He did, however, favor study of a possible National Scenic Highway System, as proposed by S. 502.

HUFSAM strongly supported mass transit and would not object "to a public transit trust fund supported from general tax sources . . . ." Mickle supported pass-through of funds to qualified urban governments, but recommended against allocating the Federal-aid urban system funds on a population basis, which would lead to "inequities which defeat the worthy purpose of an increased emphasis on urban highway needs." He suggested amending S. 502 to require each State to develop an allocation plan for Federal-aid urban system funds, the plan to be approved by the Secretary of Transportation.

In view of urgent urban needs, HUFSAM favored strengthening metropolitan planning in stages. First, encourage development of metropolitan area transportation planning agencies for better coordination of highway, transit, and land use planning. Second, the agencies should receive Federal-aid funds directly when the State and U.S. Secretary of Transportation certify that they "have shown their ability and desire to carry out, as well as plan, areawide transportation improvements." Where significant changes in community plans occur, the Federal-aid program should be suspended temporarily to allow for assessment and adjustments.

HUFSAM opposed any Interstate transfer or substitution provision that was contrary to completing the Interstate System. Route substitutions should be used only to ensure System continuity. Any cost savings should be applied to accelerated completion of the Interstate System.

Senator Stafford asked Senator Bentsen's usual question about increasing the gas tax by a penny with the revenue dedicated to mass transit. The gas tax, Mickle responded, is regressive in that it "takes away a higher fraction of total income from the poor than from the affluent." The motoring public accepted this disparity because of the "special benefits provided to the users as a class in the use of the proceeds from that tax." HUFSAM would object to a 1-cent increase for mass transit "because it is regressive without the special benefits." A Mass Transit Trust Fund should be "funded from the very broadest base of tax because it benefits a very broad base of use."

Did Mickle not believe, Senator Stafford asked, that a 1-cent gas tax for mass transit would benefit highway users by relieving congestion? Mickle explained "the approximate amount of diversion from highways to mass transit is about equal to 1 year's growth in traffic." His written statement elaborated on this point. The 1972 Transportation Needs Study provided one reason for his statement:

> All told, the DOT study showed that the proportion of travel by transit will drop from seven percent in 1970 to six percent by 1990—and this was based on the *assumption that planned transit improvements [totaling $63 billion] would be made*. The study's findings—that transit needs are high, and that they have no appreciable affect [sic] on highway needs, are brought into perspective by recent and proposed high-quality transit improvements.

He cited Canada's 1967/Expo Transit, BART, and the Washington area's METRO:

> Downtown-oriented, high capacity transit systems—although they may be needed in a few corridors—will make few if any inroads on the major transportation demands our cities and suburbs will experience.
>
> Transit riders—just like everyone else—also "vote with their pocketbook." Three out of four transit patrons use buses, and dominate in every city except New York. And when they can, nonauto users opt for auto-like services. Taxis carry more passengers than all the urban rail and commuter rail systems combined. Buses and taxis, needless to say, need good highway transportation in order to do their job well.

Senator Stafford asked Mickle to comment on the claim by highway opponents "that better highways will in themselves lead to greater congestion and more pollution" by increasing demand for more automobiles. Mickle replied:

> I have a suspicion that people that make statements like that were not around during the period immediately following World War II when we had a tremendous backlog of needs in highways. The demand was not generated by highways, it was generated by the desire of people to have a flexible type of transportation provided for by automobiles.
>
> The kind of needs program we see for the future is not one of building vast mileage for new superhighways. There are tremendous needs of the type I mentioned in my statement of improving unsafe bridges, narrow highways, bad curves, bad intersections, and most of the funds will be for that type of thing in the future, not for new highways. [*Federal-Aid Highway Act of 1973, S. 502*, p. 520-534, emphasis in original]

The afternoon session on February 15 began with Senator Jacob Javits of New York. He recalled his role in securing Senate approval in 1972 of the Cooper-Muskie amendment and said that position should be sustained in 1973:

> There is a very big issue involved here, Mr. Chairman, and that is whether or not the United States is going to realize the fact that most of our people live in major cities, about 70

> percent of our population, and just how far you can go with these ribbons of highway, and so very, very frequently, one person to a car, or when we have to adopt some other approach before we are inundated with traffic, which . . . will throttle us all, and the pollution of the emission of miles upon miles of automobiles.

We should be very proud of our modern system of highways, "but that does not mean our feet have to be rooted in concrete." In view of these concerns, he supported the two bills Senator Muskie had introduced, S. 738 to support State auto emission inspection programs and S. 739 to allow diversion of Highway Trust Fund revenue. He explained:

> Mr. Chairman, with regard to mass transit, for years and years we thought the only way out of our national transportation problem was the highway, and established an enormous trust fund for that purpose and this trust fund is today so great, it is not even being expended . . . . We have a tremendous challenge before us, where already overburdened municipalities face either deficits or the takeover of their municipal transit systems.

He also supported S. 386, the Emergency Commuter Relief Act, but this bill addressed only mass transit "and only indirectly moves to correct the fundamental imbalance in our transportation system."

He said that "an effort has been made to see the highway trust fund as a sacred cow," which means "if you took it literally, that you have got to keep tightening the noose of the highway around our necks with all of the money we have available." He continued:

> It is almost a case, Mr. Chairman, where we have to ask ourselves, have we got enough brains to save ourselves, or must we be like the lemmings, just walk into the ocean and commit suicide? Perhaps we are as blind as they are, but I would hope not.

Senator Stafford referenced Senator Javits' description of the Highway Trust Fund as a "sacred cow" and asked if he saw any reason why it could not be modified. Senator Javits said, "There is no commitment in it that cannot be changed by the Congress with the signature of the President." The Highway Trust Fund represented a commitment at that time, but the time had come to make a different commitment.

Senator Bentsen mentioned the comment about Highway Trust Funds not being expended leading to a carryover from year to year. He pointed out that these were funds impounded despite their authorization by Congress. Senator Javits acknowledged the problem.

Senator Stafford requested Senator Javits' views on a transportation trust fund for all surface transportation. Javits replied:

> The general treasury is in such trouble . . . [that to] start now and try to find $11 or $10 billion out of the general treasury, you might as well forget it. I would rather use the existing trust fund.

Senator Randolph began his question period by pointing out that he supported mass transit, had voted for every mass transit bill in the Senate, and had urged the President to release impounded mass transit funds. However, he told Senator Javits, "I am concerned that you in your desire to take care of the problems, which is certainly a problem in certain cities, you are really shrinking a highway trust fund that is needed . . . to meet the needs of some cities." If funds were diverted, "we may be in a position where we are not going to complete either one of the jobs you think need to be done, urban mass transit, including rail in some instances, and the highway program."

He was determined to complete the Interstate System and "we will work in every possible way to see that that is brought about." That would cost $17 billion to $19 billion. Meanwhile, the cost of a rail system, in even a few cities, "is astronomical." He continued:

> For that reason, I think we are going to have to find additional funds; I think we are going to have to tap new resources, as it has been suggested, with the imposition of a tax.

He pointed out that Senator Javits had supported the Highway Trust Fund and the Airport and Airways Trust Fund, "so I suggest that you might give thought to an urban mass transit trust fund." He explained, "I know it is impossible, as I see it, to have enough funds to do the job that you think must be done if we are to draw away from the Highway Trust Fund."

Senator Javits responded, "I believe it is the duty of the Congress to evaluate the pace at which the interstate highway system is built, in terms of advancing social and environmental developments in the country." If it were up to him, he would allocate 70 percent of the Highway Trust Fund revenue to urban problems, because 70 percent of the people live in cities. By contrast, Senator Muskie was proposing the use of only one-sixth of the funding for alternate uses. Further, in view of the many problems facing urban areas, we should consider whether "the greatest public weight must fall with the completion of the interstate highway system by a given date, which would mean utilizing all of the Highway Trust Fund for the purpose, or whether the greater public interest dictates that might be slowed up somewhat . . . ."

Senator Muskie concluded the session with Senator Javits by saying that in traveling around Maine, he found the reaction to the Muskie-Baker amendment was "so long as the Congress does not undertake to dictate to Maine what it should do with its share of the Highway Trust Fund, that Maine people ought not to undertake to dictate to New York what it should do with respect to its transportation needs—and that is what the Muskie-Baker amendment says." [*Federal-Aid Highway Act of 1973, S. 502*, p. 546-554]

William D. Ruckelshaus

In the afternoon of February 15, EPA Administrator Ruckelshaus appeared before the Subcommittee on Transportation. He was, he said, particularly interested in provisions of S. 502 that offered assistance to communities to alleviate motor vehicle pollution. He mentioned construction of bus lanes and the purchase of buses, but said that while these were laudable measures, "we believe this approach alone offers too little too late." Events necessitated "a more comprehensive approach in solving the major problems accompanying transportation programs."

He explained that the Clean Air Amendments of 1970 mandated the attainment of NAAQS, designed to protect public health, by mid-1977, at the latest:

> Currently, we estimate 20 metropolitan areas, including eight of the Nation's 10 largest cities, will need some form of transportation controls if air quality standards are to be met by 1977.

Transportation controls would be needed that go beyond traditional air pollution control measures. Examples included "improvements in mass transit, auto free zones, parking surcharges, staggered work hours, and conversion of fleet vehicles to gaseous fuels." Given the complexities of the issues, EPA had extended the deadline by 2 years, from 1975 to 1977. (Gaseous fuels include natural gas, hydrogen, and hydrogen-natural gas blends that reduce harmful emissions.)

The Los Angeles area faced the most severe problems. Ruckelshaus explained that EPA, under court order, proposed regulations that "would require expensive retrofitting of pre-1975 motor vehicles, conversion of fleet vehicles to gaseous fuels, greater control of stationary sources, and extensive gasoline rationing during the 6 worst months of the year."

Even in areas with less severe problems, however, "motor vehicle travel must be curtailed . . . at a time when intracommunity motor vehicle usage is increasing and continued urban growth is occurring, particularly in those areas already experiencing the greatest problems." The only way motor vehicle use could be reduced is "if alternative modes of transportation are made available." Efficient mass transit capable of "moving people where they want to go fast, and in an inexpensive fashion," would give people the incentive to reduce use of their automobiles.

Not every urban area is suited to a rail system, Ruckelshaus said, "but local elected officials should have the option of choosing between buses, rail, and highways." EPA, therefore, "strongly" endorsed Secretary Brinegar's proposal to allow greater flexibility for local communities in how they use Highway Trust Fund revenues. "Local officials are in the best position to determine the transportation systems that will solve their communities' transportation, environmental and social needs."

He was "under no illusion" that improved mass transit alone will solve the air pollution problem:

> If air quality standards are to be met and maintained, appropriate measures must also be adopted to discourage the use of private automobiles. Clearly, an integrated approach of providing better mass transit service coupled with a regulatory and/or economic disincentive mechanism will be needed in many communities.

In concluding his opening statement, Ruckelshaus pointed out that controlling air pollution was "only one aspect of the challenge of a balanced transportation system." If all vehicle emissions were eliminated, the Nation's urban areas "would still be faced with a host of transportation related problems—noise, waste of fuel resources, congestion, deteriorating cities, unemployment and underemployment, and physical alienation." Congress had to look to alternatives:

> With sufficient incentives and flexible funding, we could provide buses and commuter trains that are fast, safe, reliable, and convenient. Mass transit as a part of a sensible long-term solution to communities' modern transportation needs must be included as a major element in the design of more efficient cities.

Highways were still needed as part of an integrated transportation system:

> A balanced transportation system will only evolve if decisionmakers at the local level have a choice between various modes of transportation to serve their citizens' needs. [*Federal-Aid Highway Act of 1973, S. 502*, p. 565-567]

Senator Bentsen began the questioning by asking whether a "reasonable reduction" in air pollution would occur if the billions of dollars requested by Secretary Brinegar for mass transit were used for mass transit. Increasing mass transit funding would be "meaningful," but if Senator Bentsen was asking if that kind of expenditure would solve the problem in an area such as Los Angeles by 1977, "my answer is 'No,' it would not." In Los Angeles and some other areas, "solutions must be projected into the future in terms of decades, and not in terms of years." He added that if we continue to build highways in these areas, "we are going to assure that decades in the future, air pollution problems will be with us, hence we are not really addressing the problem as comprehensively or intelligently as we should."

Regarding operating subsidies, Senator Bentsen acknowledged that the Nixon Administration was opposed, but he wondered what EPA's view might be. Ruckelshaus stated that the Administration's position was that "they do not believe the operating subsidies should come from highway trust funds, or from the Federal Government itself." Subsidies should come from the local communities. "I think we ought to distinguish between the large capital expenditures needed to get a mass transit system underway, and the need for the continued operation of those systems in competition with any other mode of transportation at the local level."

In view of the controversies surrounding urban Interstate segments, would EPA be concerned about passage of Senator Baker's Senate Concurrent Resolution No. 6, which Secretary Brinegar had endorsed, authorizing the immediate apportionment of Interstate funds? Ruckelshaus said that Secretary Brinegar had endorsed the resolution because he did not want to see Interstate funding held up while complex issues were debated during consideration of Federal-aid highway legislation. EPA was satisfied that NEPA and other laws provided "a sufficient handle" on the controversial Interstate segments. Ruckelshaus was more concerned about "the larger issue of whether the fund itself, should be broadened so as to make its moneys available in a more flexible way."

Senator Stafford asked what assistance the Muskie-Baker amendment, if adopted, would give to areas such as Los Angeles in meeting air quality standards. Ruckelshaus replied:

> I am not so naïve to believe there is any panacea for the problem in Los Angeles. Simply by the Congress waving a wand, will not alleviate all that air pollution.

Giving local officials flexibility in how they use Highway Trust Fund revenue might encourage them to adopt a long-range plan for alternatives modes of transportation that over a decades-long span, not by 1977, would reduce emissions. Taking such a long range approach, "rather than simply to say we cannot achieve it, we are not going to do anything about it, is pretty much where we are right now in Los Angeles."

What about buses, Senator Bentsen wanted to know, if enough motorists could be attracted out of their cars? Buses, using diesel fuel, had two problems, odor and particulate matter or smoke. The newest diesel engines "can in fact be used in a more environmentally acceptable way." Further, buses are less of a problem than automobiles when it comes to carbon monoxide and hydrocarbons:

> The problem in Los Angeles is primarily a problem of hydrocarbons and its interaction with nitrogen oxides and with sunlight that in turn forms smog. What we are trying to do in Los Angeles is reduce drastically the amount of hydrocarbon that is being emitted in the air.

If buses were well patronized by former motorists, they "would greatly reduce the amount of hydrocarbon emitted into the air."

Senator Muskie said that in drafting the Clean Air Amendments of 1970, the Committee on Public Works recognized that "if the timetables set out in that legislation were to be met, that we would have to develop not only a clean car at the earliest possible date—and we set the date, 1975—but in addition, there would have to be drastic changes in the way we use the private automobile in our cities." He said that this same committee was refusing to do anything to achieve those goals. "We have to make a beginning, and I think this is the place to make it."

Since HUFSAM and others estimated that the country needed $600 billion worth of highway improvements, Senator Muskie asked what such an expenditure "would do to this country." Ruckelshaus replied that "it is almost beyond my comprehension, Senator, what that would do to this country." He would redefine the term "needs" since what was needed was "a transportation system that is safe, convenient, efficient, effective, and that whatever it takes to provide such a transportation system is the kind of approach" that is needed.

Would it be a "wise public policy" for the Federal Government to continue supporting highway construction in urban areas with air quality problems? Ruckelshaus did not want to rule out highway construction, but building more highways that would "exacerbate a situation, is the wrong way to go." Local officials needed to think in terms of transportation options "to achieve as clean air as possible consistent with moving people" and that generally meant "some alternative than simply to building more highways."

Senator Muskie asked if EPA was complying with Section 102 of NEPA and Section 309 of the Clean Air Act that "require EPA to file environmental impact statements on all Federal highway projects." Ruckelshaus explained that EPA commented on all environmental impact statements. "As a matter of fact, the biggest single burden on our Federal Activities Office is to comment on impact statements filed pursuant to highway projects." The Senator asked if EPA was commenting adversely on highway projects in the regions that needed transportation controls. Ruckelshaus replied that EPA did comment adversely in many instances. For the record, he submitted letters EPA had written commenting on the Stadium Freeway in Milwaukee; the widening of the Lincoln Highway in Cook County, Illinois; the I-95 Center Leg Inner Freeway in Washington; the Papago Freeway in Phoenix; and the Long Island Sound Crossing in New York.

Senator Muskie had additional questions, but deferred them in view of time constraints and requested written responses. Ruckelshaus, who submitted them after Secretary Brinegar released the Department's Federal-aid proposals later in the month, generally accepted that the Department's proposals would address the concerns Senator Muskie raised.

Senator Bentsen interrupted Senator Muskie to respond to the comment that the committee had not done anything about clean air. "We provided for bus lanes, we have provided for the expenditure of funds for buses, which will have an immediate impact on the emission of pollution." They were steps to cut pollution "and I think that is an affirmative step on the part of the committee."

Before Senator Bentsen could ask Senator Randolph to take his turn in the questioning, Senator Muskie said he appreciated Senator Bentsen's comment about the committee's actions. "I will concede the committee has done something. So I will modify my position to say that what it has done, in my judgment, is completely inadequate."

Senator Randolph said he was sorry Senator Muskie felt that the committee's effort had been completely inadequate. The committee had "done so much" but "is not given credit" for these efforts. "There is a feeling among some people in the country that the Public Works Committee is a pork barrel committee. That is said over and over again" even though the committee addresses a broad range of problems. He told Senator Muskie that he had worked hard to ensure that environmental reports on highway projects—"6,000 or 7,000 a year"—were part of the process. "I think that we are just concerned with how best to do the job, how quickly it can be done."

Senator Randolph had missed Ruckelshaus's formal statement but speculated that "you may have indicated that we have to think of the long-range program, how one can fit into another . . . ." Ruckelshaus confirmed that he had said "if we are going to advantageously impact not only the problem of air pollution, associated with the use of the automobile, but the local problem of transportation, and in fact the quality of life of our people in a given community, we are talking in terms of decades and not just years."

Before Senator Muskie began his second round of questioning, he wanted to smooth over any hurt feelings. He began by saying, "I am very proud to have been a member of the Public Works Committee ever since I came to the Senate, and the fact we have been able to agree unanimously on so many pieces of environmental legislation is, I think, a tribute to the committee."

If Congress did not open the Highway Trust Fund to support public transportation in urban areas, the Senator asked, was Ruckelshaus aware of any other funds that might be made available quickly to help meet the Clean Air Act requirements? "A short answer to your question, Senator, is no." The only other source was UMTA funding.

What other transportation alternatives did EPA envision? Ruckelshaus said that increased use of buses was “clearly the only short-term alternative that is available in most metropolitan areas.” Constructing a rail transit system “obviously takes longer.”

Was EPA concerned, Senator Muskie asked, about recent trends increasing the size and weight of cars as well as fuel consumption? Ruckelshaus replied that unless the country looked at the totality of the problem, including these trends, “we are really never going to solve it.” He added:

> In fact, in my own mind, even though I am the Administrator of the EPA charged with the enforcement of the Clean Air Act, I sometimes have mixed emotions about solving the air pollution part of the problem of transportation, because what that may, in effect, do is take away the public pressure to do something about transportation as a whole. I think we need public demand to address this problem in a comprehensive and intelligent total way if we are really going to come up with any solutions that make any sense in the long run.

Was EPA considering the issue of limiting motor vehicle sizes? “I think we are just on the threshold of discussing that issue. The issue has arisen in term of the claims that the emission devices that are being put on the 1973 automobiles are causing an enormous fuel penalty.” People were discussing the fuel penalty all over the country:

> We made an analysis of the factors that were causing fuel penalties, and we found that automatic transmission causes a 6 percent fuel penalty, an air conditioner causes a 9 percent fuel penalty—up to 20 percent during certain periods of use in the summer—that automobile emission devices, on the average, of a 1973 automobile over the uncontrolled 1968 cars causes a 7 percent fuel penalty, but the single most important factor in fuel penalty is the weight . . . . If we are concerned about the conservation of fuel, then I think we ought to look at all of these things that cause fuel penalties and think about limiting those that are of less social benefit. If you do that, then the last one you get to would be emission control devices.

Senator Randolph took the final question slot by asking about the BART system in the Bay Area. Ruckelshaus had not ridden it, but said officials in San Francisco told him they “are optimistic about its eventual use, and we are watching it very carefully as is the Department of Transportation.” Senator Randolph agreed it was “a tremendous project,” but added, “It is the terrific cost of these projects, and to pull the money from the highway trust fund, that is not going to do the job.” Ruckelshaus agreed it would not do “the total job,” but the country had to “start somewhere.”

“The Congress has committed itself,” Senator Randolph said, “to urban mass transit,” but Ruckelshaus doubted that “the commitment is sufficient in terms of the long-range kind of commitment that exists with the trust fund.” The Senator asked if he would support a trust fund for mass transit. Ruckelshaus said the Administration’s approach was to use “available trust fund money, so as not to bias the decisions of the local officials toward one mode of transportation over another.”

Ruckelshaus added that comparing rail, bus, and automobile alternatives in urban conditions, a rail system is not always the best way to go" although it might be cost-effective in some cases. Senator Randolph said he was skeptical about rail systems:

> I hope that the rail systems work. I hope we have enough money to do the job. In the BART system, the estimate of traffic has been cut by 50 percent . . . . I frankly am a believer in change, and in meeting the problems of change, but I doubt that the Metro system in the District of Columbia is going to be the success that is envisioned. I hope it will be, but I doubt it very much. The periods of use of such a rail system are 3 or 4 hours a day, when the road is being used 24 hours a day, and in that long period, the rail system is not being used.

Ruckelshaus cautioned against judging BART or any new rail system in its first few months of operation "because we are talking about attitudes of people, and their dependence on certain modes of transportation shifting to another." Education was needed to "convince people why they should adopt some provision of transportation which is public." But the decisions made today will last for decades, so "I think we have to protect ourselves into the future in determining how we have to move our people in order to answer ultimately many of these questions." [*Federal-Aid Highway Act of 1973, S. 502*, p. 567-576, 619-620]

Following Ruckelshaus, the subcommittee heard from a panel of State transportation officials: Secretary Altshuler of Massachusetts, Secretary Harry Hughes of Maryland, Secretary Norman Clapp of Wisconsin, and Commissioner Raymond T. Schuler of New York. Secretary Hughes, a former State legislator since winning election in 1954, took the lead in explaining that 20 States now had departments of transportation. They met informally for the first time in September 1972 in Baltimore and 17 of the States attended a second meeting, held in Miami, the previous week. One of the reasons for the Miami meeting was to discuss the Federal-Aid Highway Act.

(The Maryland Department of Transportation had begun operations on July 1, 1971, the 12th State transportation department in the country. It combined the Maryland State Roads Commission, the Baltimore Metropolitan Transit Authority, the Department of Motor Vehicles, and the Aviation Commission.)

Secretary Hughes said State transportation officials recommended a funding level of $4 billion for the Interstate System, $1.5 billion for urban roads, $1.5 billion for rural needs, all out of the Highway Trust Fund, and $ billion for transit out of the general Treasury. In addition, Hughes said, the 17 States were "for flexibility in the funding of transportation, and in meeting the transportation needs, and are in favor of some more simplicity in trying to meet these problems. He then went through the issues the 17 States had discussed. They recommended a general block grant structure combining existing and proposed Federal-aid categories into three principal parts: Interstate, urban and rural.

The pass-through provision should be modified to permit a responsible State agency to perform the functions of developing transportation plans.

All the States, except California, supported optional use of urban and rural funds for public transportation. Eleven States favored optional use of the funds for rail transit, while the others, including California, opposed it.

The States favored completion of the Interstate System but recognized that because of environmental challenges, some segments would not be built. For those that were deemed not essential to Interstate connections, flexible substitution provisions should be provided, with the emphasis on: "A dollar-for-dollar rather than a mile-for-mile substitution, with costs being determined at time of transfer." In addition, some or all of the States favored permitting substitutions as follows:

> For other Interstate Highway projects anywhere within the State.
> The transfer of all or part of the removed segment funds to the urban fund for the use of the urbanized areas from which the segment was withdrawn.
> The responsible statewide transportation institution must consult with local governments affected by substitution. The consultation must not be interpreted as requiring local government approval which would undermine the responsibility of the State institution to complete the Interstate System.
> The present deadlines must be amended to require submission by the States of their schedule for completion of the Interstate System. The new deadlines should be July 1, 1974, for submitting completion schedules.

Senator Bentsen pointed out that the President's budget included only $4.4 billion for the Federal-aid highway program as part of the effort to address "the problem of inflation, trying to hold down the cost of living, and trying to protect the deteriorating dollar." He said that "some things have to give" and that S. 502 called for less than the comparable bill in 1972. Was it realistic to talk about an $8 billion authorization under the circumstances? Hughes explained that requesting an authorization of $8 billion was the consensus of the 17 States meeting in Miami. It was based on the cost of completing the Interstate System and addressing other road needs and urban problems. He admitted he did not think it realistic.

Commissioner Schuler of New York added that "the significant thing about our appearance today is that . . . we speak in terms of full funding because we are here fighting for everyone's interest in transportation in the Nation." The point was not the level of funding, which was a matter for the President, OMB, and the Congress to decide. Rather, the point was "the need for flexibility in this funding, so that those of us who do have transportation responsibilities in our States [can] use the dollars to the best needs we have in our States, and not be bound to the strict and past categories . . . ."

Senator Bentsen asked for clarification of the States' views on the pass-through provision. Schuler stated that in New York, as in the other 19 States, his department "is responsible for all modes in all areas of the State." As a result, "the State is the most effective mechanism to address transportation problems and their solutions . . . ." He acknowledged that in States without a department of transportation, the pass-through provision might be desirable if the funding went to "a constituted government on the basis of one-man, one-vote which has a viable organization to implement projects."

Altshuler elaborated on the Miami discussion by pointing out that the metropolitan perspective was "very important in dealing with urban highway problems," but State transportation officials objected to pass-through for several reasons:

- First, "there are few genuine governments at the metropolitan level" that could implement projects. "As written, its real intent is to pass through the funds to the individual cities and towns within the metropolitan areas via the conduit of the co-called metropolitan transportation agency."
- Second, the provision did not specify that the metropolitan agency must encompass all modes. It "could be simply a highway agency."
- Third, the provision appeared to anticipate that States would continue to provide the matching share. The States would be less concerned "if it were the localities that would put up the matching funds required for utilization of Federal-aid."
- Fourth, he thought the provision "gets much of its thrust from the history of certain abuses that have occurred in the Interstate program." States had "overridden the desires of the local communities" for certain Interstate segments in view of the 90-10 matching shares, but no such history of abuse occurred on other Federal-aid highway and transit programs. These projects, moreover, did not have the "devastating impacts that some Interstate projects in urban areas have had."
- Finally, the Secretary of Transportation already had the authority to reject projects where a dispute arises between the State and local communities.

"Thus, our position is that the executive responsibility ought to remain with the State governments, which have the capacity through their Governors and State Departments of Transportation to keep the process moving, with all modes of transportation and the full statewide and metropolitan-wide perspectives receiving their due." [*Federal-Aid Highway Act of 1973, S. 502*, p. 567-576, 621-628]

The Final Day of Senate Hearings

On February 16, AASHO was among the final witnesses before the Subcommittee on Transportation. The District of Columbia's Thomas Airis, president of AASHO, began by acknowledging that many of AASHO's recommendations in recent years were incorporated into S. 502. However, the 1972 Transportation Needs Study had identified extensive capital improvement requirements:

> Their totals included $602 billion representing highway needs; and urban public transportation needs of $63.5 billion, which were divided approximately $45 billion for rail oriented, and $18.5 billion for highway-oriented transportation. The latter is largely busses [sic].

Realistically, he supported a program of $300 billion, extended to 1990, to address the most important needs, or $20 billion annually. This total involved Federal, State, and local funding, with the Federal share in the magnitude of one-third or $6.7 billion per years, not including highway safety programs.

The fact that 80 percent of the Interstate System was open "does not really indicate the total work effort needed to complete the Interstate System." Cutbacks, impoundments, and other delays had affected the schedule. The job of completion was "going to be more complicated and complex" because the remaining segments were among the most difficult, "such as sections in highly populated metropolitan areas, or mountainous sections, where the expenditure per mile is very high." Nevertheless, the Interstate System could be completed in the 1970s "if the funds were made available." That is, if the funds were authorized and the Administration did not impound a portion of them, "the highway industry can give quick job opportunities to the returning veterans, because we are geared for a greater volume of work than really has been allowed."

AASHO also addressed the questions raised by Senator Bentsen in his invitation. Some of the answers were.

- The matching ratio for the basic Federal-aid highway program should be changed permanently from 50-50 to 70-30 "in order that the accumulating Highway Trust Fund balances can be recycled into their intended purpose."
- Congress should consider changing the traditional 2-year Federal-aid highway bill to a 4-year authorization.
- Interstate authorizations should continue at $4 billion a year.
- The bill should not include language that would "impair or encroach upon" the State highway agencies' authority over the State highway system, including extensions through urban areas of 50,000 population and above.
- Urban areas of 50,000 population and above should be encouraged to provide an areawide "authority" or "consortium" to carry out the 3C transportation planning process and commit local governments to the implementation phase of highway improvements. The State highway agency would have to approve the plan.
- AASHO opposed impoundments, but if they occurred, "an amount equal to the highway user revenues withheld [should] be automatically distributed by the Secretary of the Treasury directly to the States" based on their contributions.
- Up to 50 percent of funds, up from 20 percent at present, should be available for transfer among the Federal-aid system categories.
- Congress should consider equitable reimbursement for toll roads, bridges, and tunnels incorporated into the Interstate System so they may become free of tolls.
- Regarding Interstate completion, Congress should retain 1973 for submission of schedules for expenditure of funds for completion of remaining segments. However, the Secretary should be allowed to extend the 1975 deadline for submission of PS&Es.
- Those attempting to block highway projects in court should be required to post a bond of sufficient amount "to show sincerity of purpose and responsibility of action."
- AASHO opposed the pass-through provision by an overwhelming majority of the State highway agencies.

- AASHO supports simplification of program procedures, and recommends extending the procedures in place for Federal-aid secondary projects to the other systems, not including Interstate projects.
- Congress should create an adequately financed mass transportation trust fund from revenue other than from taxes currently levied for the Highway Trust Fund.

Senator Bentsen commented on the difference between AASHO's recommendation of $7½ billion and the Administration's $4.4 billion. Maine's David H. Stevens replied, "we felt a compulsion to bring those [amounts] to the attention of the Congress because of the needs in the highway program." He added, "We would like to get this money under the wheels, if we can, as quickly as possible" to curtail construction cost inflation.

The Senator observed that AASHO had not taken a position on the priority primary network. Stevens said the members had several concerns. They were concerned about creating another category "with all of the paper shuffling in the program." They also wanted to concentrate on completing the Interstate System and were concerned that funding might be diverted. In addition, the States were concerned "over how the routes could be selected, and whether or not they could be uniform throughout the States without definite guidelines." [*Federal-Aid Highway Act of 1973, S. 502*, p. 702-712]

Towards the end of the day, the Subcommittee on Transportation heard from Dr. George Wiley of the Urban Environment Conference, Inc., and Helen Leavitt, author of *Superhighway-Superhoax*. Dr. Wiley said he was the national coordinator for the Movement for Economic Justice. "This movement is a new movement by the people concerned about the terrible disparities in the distribution of income and resources in our very rich and affluent society." He identified the group's important concern:

> . . . the fact that the resources going into the highway trust fund are being used to the great disadvantage of the people who reside in the cities of America, and it is a great disservice to the majority of people in the country, and it works a special hardship on poor people and minorities who live in the center cities, but I believe that it does a disservice to us all, and I especially want to emphasize on poor people.

Millions of working people who live in cities and earn $5,000 to $15,000 are faced with the poisoned fumes of the automobiles even though they do not receive benefits from them:

> [It] is these people whose pocketbooks are being raided by the terrible misuse of their tax money for purposes that do not benefit them or their families, and whose jobs are being undermined and whose access to jobs are undermined by the encouragement of the flight of business into the suburbs, a flight that they may not be able to follow, because in many cases, they do not, or they may not have access to the transportation to get to those jobs that they do desperately need and depend on.

Wiley did not view S. 502 from the perspective of the "world of politicians, planners, engineers, and administrators." He viewed it from the world of the urban poor:

> These are the people whose homes most often get destroyed, neighborhoods bisected, jobs siphoned away, whose transit systems disappear, and whose very health and that of their children is endangered.

From that perspective, he said that "it is unreal coming to hearings like this," adding:

> Everyone living in the real world knows that the Federal highway programs have, since 1955, had an incalculable impact on the face of this country and on its social fabric.
>
> Who is it who does not know that the highway programs have been one spur to the tremendous growth of suburbia?
>
> Is there anyone here today who does not know that building those roads was accomplished time and again, in city after city, by bulldozing a poor neighborhood.
>
> That has been common knowledge from the beginning for anyone who cared because the decisions to run the roads through those neighborhoods were conscious decisions, based on the economics and politics of the situation.

According to recent studies, Wiley said, a center city resident is twice as likely to be unemployed as his or her suburban counterpart. "The principal causes of this disparity are the displacement of people and jobs and the disappearance of urban transit systems." He continued:

> In the 3 years between 1967 and 1970, 146,950 families were rooted out of their homes by highway and renewal programs.

In a job market based on the automobile, "not having one often becomes a sentence to joblessness, homelessness, and disillusionment, and eventually welfare." He summarized the destructive efforts of "the Nation's romance with the automobile" and the consequences of highway building:

> It is well known that—80 percent of air pollution in major cities attributable to cars; as much as 60 percent of land area in some cities devoted to streets and parking; as many as one-third of the people in major cities with health and respiratory problems attributable to or aggravated by air pollution; fuel shortages; dying transit systems and the flight of jobs to the suburbs—that these and other problems are getting worse.

As for S. 502, Wiley said that the Urban Environment Conference believes "we need to provide a great deal more money for our cities to begin to turn around the decline of public transportation." The group strongly supported the Kennedy-Weicker bill, and supports the Muskie-Baker amendments only as an "interim measure which would start to change Federal transportation priorities." In addition, the group supported the provisions that gave State and local officials the option of using Interstate funds "to satisfy other transportation needs in lieu of segments of the planned system under challenge with the qualification that the Federal share should be at a 90-10 ratio on the substituted project as well." Wiley said the bill also should provide for rail transit as called for in the Muskie-Baker amendments, S. 679.

S. 502 was converting concerns "into politically acceptable rhetoric, but there is a vast gap between rhetoric and substance." He concluded:

> Past transportation programs have consciously sacrificed the needs of the urban poor in the interests of suburbia and more highways.
>
> It is time some of the money started flowing back the other way. If the center cities could sacrifice their neighborhoods and their livelihoods so that the suburbs could drive to work, it is only fair now that the suburbs apply some of their automobile taxes to transportation benefitting the inner city.

Senator Bentsen pointed out that Dr. Wiley had used up the time allotted, but he gave Leavitt a couple of minutes. She agreed with Wiley that S. 679 and Senator Muskie's amendments "provide more flexibility for funding public transportation." As might be expected, she was for opening the Highway Trust Fund, but her explanation was unusual:

> I contend it has been "open" for many years. A cursory look at the administration's unified budget for 1974 reveals that highway trust fund receipts will total $5,749 billion. Outlays will total $4.700 billion, leaving a $1 billion surplus. This surplus, along with other Federal trust fund surpluses, will simply be applied to the budget deficit. In other words, trust fund receipts are now helping finance space, defense and other federal financed programs.
>
> Between 1971 and 1974 the surplus balance from the highway trust fund alone increased 100 percent from $3.6 billion to $6.7 billion. Over one-quarter of the $505 billion public debt is money borrowed from trust funds established for specific programs. Indeed, surplus highway trust fund taxes are treated as any other tax collected, and simply applied to deficits accrued from other programs.
>
> So much for "opening" the sacrosanct trust fund.

She pointed out that 67 cities would soon have to curtail automobile transportation to meet the new air quality standards. She cited the District of Columbia, where she lived, as an example of a metropolitan area that once had a trolley service that worked well until after World War II. Initially, she said, "engineers recommended the system be expanded and that no radial expressways be built in the Nation's Capital." However, "pressure from road interests and generous funding resulted in a massive freeway program to accommodate the automobile." By 1960, the trolley system was being dismantled. "Today these same trolley cars serve the residents of Barcelona, Spain." Commuter rail also deteriorated.

Now, with 1.2 million motor vehicle trips a day, the District was experiencing one of the worst pollution problems in the country. "And it is auto-generated." At present, she said, "we have embarked on a $3 billion subway construction program in an attempt to duplicate and even improve the service we once had."

The "Federal generosity toward highways" had distorted the transportation planning process in metropolitan areas such that "you now find yourselves in the ridiculous position of further expanding and multiplying your mistakes with still more money for the Interstate System, and more money for the ABC programs." And based on the same logic, "you intend to provide a still larger juggernaut on our small towns and cities, the economic growth center development highways." Meanwhile, she said, "our transportation problems grow worse, which is itself an incredible feat."

Put simply, "we need public transportation, and we need it now." She opposed automatically funded programs based on the trust fund concept "because such programs experience little or no review and no control of spending." Simply adding public transportation to the "pot" of highway legislation would not address the problem "without reform of both this committee and your counterpart in the House, as well as at the State level, [and] will no doubt result in further chaos in transportation planning."

Leavitt proposed making Federal transportation funding contingent on each State establishing a department of transportation. She pointed out the precedent that the Federal Aid Road Act of 1916, which established the Federal-aid highway program, required each State to have a State highway agency capable of carrying out Federal-aid projects. She continued:

> As for reform within this committee, it would be imprudent, immodest, and most unladylike for me to tell you gentlemen what I think you ought to do.

With the conclusion of her statement, Senator Bentsen asked if Dr. Wiley agreed with the Nixon Administration's opposition in 1972 and again in 1973 to operating subsidies. The reply was indirect. "I could agree with the administration on some things that they do, but I believe that their opposition is based on the wrong reasons." Construction of superhighways should be halted until a serious review of mass transit can be undertaken and the Highway Trust Fund can be opened to nonhighway uses.

Leavitt added that the Urban Environment Conference would support operating expenses "with the realization that again unless you have some kind of oversight, some kind of control on operating expenses, it too can become a runaway spending program." She added:

> In other words, we could look forward to the day when public transportation serves the needs of the majority, and it might actually become a profitable venture again, at which point one might question operation expenses . . . . We will never know whether a bus company could make a profit, until we get a balance in transportation, and more people start using it.

With so many other problems facing the Nation, Senator Bentsen asked where the money for mass transportation should come from. "How do you balance these out, Doctor?" Wiley pointed out that the problem was the priority given to superhighways despite all their negative consequences. "If we are talking about priorities, the priority ought to be on the people who are the most disadvantaged . . . ." The priority should be "on mass transit, and development of a comprehensive transit plan rather than on pouring money down the sewer of superhighways."

Senator Bentsen asked Dr. Wiley, "Are you antihighway, or are you just against the degree of expenditure for highways?" Wiley replied "that the priorities are just totally out of whack" and the time had come to "put a stop to the rush for more highways until there could be a serious evaluation of how much more money could be put into mass transit systems." The Urban Environment Conference urged putting no more Federal money into highways until this was done.

Senator Stafford referenced Dr. Wiley's comment about the percentage of air pollution attributable to automobiles. Will not a considerable proportion of that pollution be alleviated by 1975 under the Clean Air Amendments of 1970? Wiley replied with a question: "Will we tolerate the people killed between now and 1975?" Leavitt pointed out that *The Washington Post* carried a story that morning in which the Ford Motor Company said it could not meet the standards. Wiley added that the devices to curb pollution would not deal with the total problem he had described in his statement.

Senator Stafford also wanted to know if Leavitt wanted to dictate how a rural State such as Montana should spend its receipts from the Highway Trust Fund. She replied that she was concerned that many States still did not have a department of transportation. As for Montana, it may be a rural State, but "this does not mean that one cannot take a look at other forms of transportation." Just changing the psychology to think of transportation rather than "simply highways" would be a step forward. [*Federal-Aid Highway Act of 1973, S. 502*, p. 750-760]

The Brinegar Bill

Secretary Brinegar finally released the Department's legislative proposal on February 21, 1973. It was called the Federal-Aid Highway and Public Transportation Bill of 1973. As he had indicated during his testimony, the bill would open Highway Trust Fund revenues for mass transportation capital improvement projects, including rail projects in urbanized areas. A companion measure would amend the Urban Mass Transportation Assistance Act by virtually doubling the $3.1 billion of funding made available in 1970. In a statement announcing release of the bill, Secretary Brinegar said:

> President Nixon, in a special message to Congress, placed high priority on the use of Highway Trust Fund money for mass transit. We are implementing this policy by providing greater flexibility both in transportation funding for urban areas as well as in the disposition of those funds by State and local authorities, who know their own priorities best . . . . The increased UMTA funding would assure program continuity and orderly development of new large-scale projects in our urban areas.

In a letter transmitting the legislation to the Congress, Secretary Brinegar explained:

> Since the adjournment of the last Congress, we have reviewed our prior proposals and those advanced by members of the Congress. We have given particular attention to the important question of the proper use of Highway Trust Fund monies for transportation projects—especially those in urbanized areas. We believe that only by the proper combination of highway and mass transit capital investment can we expect to effectively meet the severe

> and complex transportation problems faced by our urbanized areas. Our proposed bill . . . reflects this belief by making funds available for both types of investment, including improvements to bus and rapid rail systems.
>
> We also believe that because of their familiarity with the particulars of their transportation problems, large urbanized areas should decide for themselves the proper mix of highway and mass transit capital investment. Accordingly, the bill passes through urban system funds to urbanized areas having a population of 400,000 or more.
>
> The bill also provides a means for the resolution of the controversies which have tied up a number of Interstate links in our urban areas. Recognizing that the controversies are usually not whether additional transportation capacity is needed, but rather how best to supply it, we would permit funds originally authorized for the Interstate System to be expended for other highway and public transportation projects.

In a departure from tradition, the bill provided for a 3-year authorization (FYs 1974-1976) instead of 2 years. Over that period, the bill requested \$3.65 billion for the Federal-aid urban system and \$3 billion for rural highways. Interstate authorizations totaling \$19.8 billion were spread over the period through FY 1980, the revised completion date for the System. As part of the Interstate facility, Interstate funds could be used for the construction of the following:

> . . . exclusive or preferential bus lanes, highway traffic control devices, passenger loading areas and facilities, including shelters, and fringe and transportation corridor parking facilities to serve bus and other public transportation passengers.

Mass transit projects could not be approved unless the Secretary was satisfied that the responsible public mass transportation agency had adequate capability to use fully the proposed project and to maintain and operate properly any equipment acquired.

Secretary Brinegar highlighted other important features, including changes affecting the Federal-aid urban system. All routes on current systems, including primary and secondary extensions, in urbanized areas were to be combined into a more flexible urban system. Federal-aid urban system funds—\$1.1 billion for FY 1974, \$1.2 billion for FY 1975, and \$1.35 billion for FY 1976—could be used on highway projects or public mass transportation projects defined as:

> . . . ground transportation providing general or special service (excluding school bus, charter, and sightseeing service) to the public on a regular and continuing basis. Included within the scope of the projects are exclusive or preferential bus lanes, highway traffic control devices, passenger loading areas and facilities, including shelters, and fringe and transportation corridor parking facilities to serve bus, rail, and other public mass transportation passengers; the construction of fixed rail facilities; and the purchase of passenger equipment, including rolling stock for fixed rail facilities.

The rural segments of the primary and secondary systems would be combined into a rural primary system. The bill also encouraged rural public transportation systems by permitting primary funds to finance the Federal share of projects for:

> . . . highway traffic control devices, passenger loading areas and facilities, including shelters, and fringe and transportation corridor parking facilities to serve bus and other public transportation passengers, and for the purchase of passenger equipment other than rolling stock for fixed rail facilities.

The goal, Secretary Brinegar said, was "continuation of a strong rural highway program, providing State officials flexibility for transportation investments for rural areas, extension of the secondary road program procedures to all Federal-aid systems other than the Interstate System, and expansion of the coverage of our billboard control program."

The Interstate transfer provision would be available until July 1, 1974. Upon the joint request of a State and the local government concerned, the Secretary could withdraw approval of a controversial Interstate segment if he determined that it was not essential to completion of a unified and connected Interstate System and he received assurances the State did not intend to build a toll road in the corridor. Following withdrawal, the Secretary could permit dollar-for-dollar substitution, based on the 1972 Interstate Cost Estimate, for any project on any Federal-aid system within that State, including substitute Interstate routes and highway-oriented or fixed rail mass transit projects. The matching ratio would be the ratio applicable to the particular Federal-aid system.

The Secretary would remove from designation on July 1, 1974, any segment that the State had not established a construction schedule for within the period of Interstate funding availability and where the Secretary had not received assurances the schedule would be met. In addition, the Secretary would remove any Interstate segment that had not submitted a PS&E for approval by July 1, 1976.

The planning section of the bill required the Secretary to cooperate with the States in the development of transportation plans and programs formulated with due consideration to their probable effects on the future development of urbanized areas. Projects must result from a 3C transportation planning and programming process conducted by local governments with consultation and participation by the State. All reasonable measures must have been taken to permit public participation in the planning and programming process.

Similarly, Federal-aid urban system projects must be selected by appropriate local officials after consultation with the State in accordance with the 3C planning process.

Further, Federal-aid urban system funds apportioned to any State attributable to urbanized areas with a population of 400,000 or more would be allocated to that area based on the ratio that the population of the State bears to the population of all such urbanized areas within the State. If the urbanized area had established an agency to plan and carry out projects, the funds would be made available to this agency. The urbanized areas were not required to create such an agency, but such agencies would receive funding if they were created under State law by the local unit or units of general purpose government and were suitably empowered, equipped, and organized to plan and carry out projects.

Other provisions included:

- The concept of Certification Acceptance, available only for Federal-aid secondary projects, could be extended to the other Federal-aid systems, exclusive of the Interstate System. The Secretary would discharge his responsibilities by accepting a certification from the State that it is capable of performing those responsibilities. The Secretary would be required to conduct a final inspection. Certification Acceptance applied only to the Secretary's responsibilities under Title 23, United States Code, not to NEPA or other laws.
- Added a section, Section 146, to Title 23 for development of routes for bicycles, pedestrians, and equestrians. Funds authorized for the Federal-aid systems could be used for such routes on or in conjunction with highway or other appropriate rights-of-way. The funds also could participate in the cost of traffic control devices, shelters, and bicycle parking facilities. Projects would have to be consistent with an overall plan providing for safety and contiguous routes. Similar projects also could be developed with funds authorized and appropriated for Forest Highways, forest development roads and trails, public lands development roads and trails, parkways, Indian Reservation Roads, and public lands highways at the discretion of the Department charged with responsibility for the programs.
- For the first time, funds for Indian reservation roads and bridges would come from the Highway Trust Fund. Funds for Forest Highways and public lands highways would come from the Highway Trust Fund as directed by the Federal-Aid Highway Act of 1970.
- Established a new federal-aid highway system consisting of roads on Indian reservations that were not on any other system. Funds would be made available to the Secretary of the Interior for use in a manner consistent with the exercise of his trust responsibility. The first step would be for the Interior Secretary to work with the States, counties, and Indian Tribal councils to conduct a study of the new Federal-aid system, including a functional highway classification study and a cost estimate to be completed by July 1, 1974.
- The bill retained the Federal-State matching share of 70-30 included in the 1970 Act.

Senator Baker introduced the bill as S. 967 on the Senate floor on February 21. He was confident, he said, that with 4 days of hearings completed, the Committee on Public Works would complete its work expeditiously. "This is vital. Each day of delay means that we are likely to miss another day of the spring and summer construction season in many areas of the Nation." He added that Secretary Brinegar supported Senate Concurrent Resolution 6 to allow apportionment of FY 1974 Interstate funds. [*Congressional Record-Senate*, February 21, 1973, p. 4825-4832]

In the House, Representative Kluczynski introduced the bill as H.R. 5138.

A Change of Heart

Also on February 21, Representative Kluczynski reversed his longstanding view of how Highway Trust Fund revenues should be used. He now favored giving cities the option of using them as they saw fit. He still supported the national highway program, as he had throughout his 22 years in Congress, but said, "I feel that the need is so great in the cities of our nation, and especially in my own city of Chicago, that I have decided to step forward and support proposals to grant the states and cities the option to spend a portion of the monies, heretofore earmarked solely for highways, for public transportation programs, as well." Broadening the uses of Highway Trust Fund revenues would "help the highway program to continue to meet the nation's transportation objectives."

Washington observers attributed the surprising development to "severe pressure, partially from federal officials, but more from Mayor Daley, who has been known to feel for some time that too much tax money was going into rubber tires and not enough into buses, subways and commuter trains." Some of the pressure came from trying to help his hometown address its transit problems. The Chicago Transit Authority (CTA), which managed the city's buses, subways, and elevated trains, was operating under a State interim subsidy of $18.9 million but faced millions of dollars in operating losses before the end of the year. If funding to close the operating deficit could not be found, CTA would have to cut service and lay off some of its 12,000 workers.

Milton Pikarsky, a new member of the CTA board and soon to be its chairman, said he was not surprised by the turnaround. "I've known for at least a year his feelings on public transportation," but suggested that Representative Kluczynski had continued to act on his earlier views because he knew his support for diversion of Highway Trust Fund revenue was not shared by other committee members.

John Kramer of the Highway Action Coalition praised Kluczynski as a "statesman" for his reversal of position, saying his support "will make a major difference to our efforts to shift national transportation spending priorities away from yet more highway construction towards needed public transportation facilities and services." Kluczynski had been "one of the chief roadblocks" to opening up the Highway Trust Fund to transit, but his shift had come "in the light of new realities." [Murray, David, "Kluczynski Switches, Backs Road Funds for Mass Transit," *Chicago Sun-Times*, February 22, 1973; information on CTA operating subsidy from "Chicago Transit Board to Set Cutbacks Today as Subsidy Funds End," *The Wall Street Journal*, July 5, 1973]

The *Chicago Tribune*, in an editorial, praised the Nixon Administration for its efforts to allow the use of Federal-aid highway funds for mass transit, and agreed with its opposition to operating subsidies. The Federal Government should help urban areas plan, construct, and equip mass transit systems. State and local governments must assume responsibility for ensuring that the levels of service and fares meet the transportation needs of the people they serve. "If an operating subsidy is needed to provide adequate service it should not come from Washington."

Efforts to open the Highway Trust Fund in 1972, failed "thanks in part to Rep. John Kluczynski . . . ." The editorial continued, "Now that the CTA is in trouble—and at Mayor Daley's urging—Mr. Kluczynski has seen the light and has pledged to support the legislation."

The newspaper pointed out that Mayor Daley wanted Federal funding for operating subsidies. Based on experience, the editorial did not think Illinois would get back as much as it put in. "Illinois taxpayers would be contributing to subsidies not only in Chicago but also in New York City, Atlanta, St. Louis, and elsewhere." Instead of waiting for Federal subsidy funding, the State should create regional mass transit authorities to administer funding from State or local sources. ["Highway Funds for Mass Transit," *Chicago Tribune*, February 25, 1973]

Engineering News-Record observed that Kluczynski's "defection" was "bound to hurt trust fund purists." Their reaction, however, was subdued. An unnamed "highway user group spokesman" said:

> We really don't want to criticize Klu. He's been under intense pressures. It is hard to envision him suddenly switching positions like this, but on any vote that's on the public record, he's going to have to vote for diversion from now on. ["Roads Subcommittee Head Now Supports Tapping Trust Fund," *Engineering News-Record*, March 1, 1973, p. 12]

(On March 27, 1973, the Illinois Senate voted to override Governor Daniel Walker's veto of a bill to provide $12.6 million to aid mass transit in Chicago, to be matched by $6.3 million from Chicago and Cook County. The Illinois House had voted to override the veto a week earlier. The funding would cover CTA's operating deficits through June 30. Governor Walker had asked that the State pay only half of the needed $18.9 million. ["Chicago Transit Agency to Get Subsidy Funds; Veto is Overridden," *The Wall Street Journal*, March 28, 1973])

King Auto's Day of Judgment

In the wake of Ruckelshaus's plan for the Los Angeles area, *The Baltimore Sun* published a column on February 3 titled "King Auto's Day of Judgment Approaches." Despite "a howl of incredulity and anguish" arising after the announcement, "something of the sort will come to pass" around the country in time. It was "high time to divert public funds from more highway construction to the improvement of public transportation":

> The "concrete lobby" of highwaymen prevented President Nixon, last year, from tapping the federal Highway Fund for that purpose. In Michigan, where King Auto first proclaimed his suzerainty, the state concrete lobby prevented Governor Milliken from using any part of the sacrosanct state highway fund even to hire more highway patrolmen. We go on tearing cities and countryside apart for new roads, as if we meant to pave the whole face of America with concrete, and drive madly in all directions, fouling the air until we are asphyxiated.

Soon, the end would come. "When King Auto expires, I'll go to his funeral—but just for the ride." ["King Auto's Day of Judgment Approaches," *The Baltimore Sun*, February 3, 1973]

President Nixon had anticipated that day in his State of the Union Message on Natural Resources and the Environment, submitted to Congress on February 15, the same day Ruckelshaus appeared before the Subcommittee on Transportation. The President had extolled his Administration's progress in passing NEPA, the Clean Air Amendments, and other legislation, as well as creation of

EPA. "Year by year, our commitment of public funds for environmental programs continues to grow; it has increased four-fold in the last four years." Much remained to be done. In the area of "Controlling Environmental Impacts of Transportation, he had said, as noted earlier:

> I will continue to place high priority upon my request to permit use of the Highway Trust Fund for mass transit purposes and to help State and local governments achieve air quality, conserve energy, and meet other environmental objectives.

EPA, however, was having trouble in the courts with implementation of the Clean Air Amendments of 1973. Its decision to extend the deadline for compliance with air quality standards by 2 years was under challenge in the courts.

On January 31, 1973, the U.S. Court of Appeals in the District of Columbia had ordered EPA to rescind its order extending the deadline for 17 States. The court acknowledged that Ruckelshaus had acted "in the best of faith," but had violated the "strict requirements of the Clean Air Act of 1970" and in so doing had not complied with the congressional intent as reflected in the setting of "limited and well-defined statutory extensions." Ruckelshaus was to inform the 17 States that the compliance date was April 15, 1975, for submitting corrected plans for meeting the standards. The States must identify plans to meet the standards or make a persuasive case for a delay until 1977. [Kenworthy, E. W., "Court Bars Delay in Cleaning Up Air," *The New York Times*, February 2, 1973]

The auto industry was not faring much better. On February 10, the same court turned down the auto industry's request for a 1-year extension, but ordered EPA to hold hearings on their concerns and decide within 60 days. [Kenworthy, E. W., "New Hearings Set on Car Emissions," *The New York Times*, February 11, 1973]

Having lost in court, the industry tried public relations. The president of Ford Motor Company, Lee A. Iacocca, appeared before the New York Chamber of Commerce on February 15 to argue for a 1-year extension of Federal emission standards for automobiles:

> As of today . . . we know of no practical way to meet the 1975 emission standards for our products in time to produce 1975 models.

As Helen Leavitt would mention during her testimony before the Subcommittee on Transportation, Iacocca recommended a 1-year extension and temporary standards that could be met by cars without catalytic converters. "We've already spent millions of dollars and we can come pretty close, but can't meet the precise requirements of the law." California, he added, would need a 2-year extension. His proposal, he said, could save "at least $100 to $125 a vehicle and still improve air quality." [Associated Press, "Ford Chief Asks Exhaust Rule Lag," *The Washington Post*, February 16, 1973]

Two days earlier, Judge Charles W. Joiner of the U.S. District Court in Detroit fined Ford $7 million because some employees had tampered with test engines so they would comply with air quality standards. Ford did not contest the Justice Department's charge. The tests in question—engines ran for 50,000 miles over 100 days—had taken place between the fall of 1971 and the spring of 1972 on engines for the 1973 model year. The improper adjustments had not been reported to the EPA, but rendered the results meaningless when discovered. U.S. States Attorney Ralph Guy, Jr., said the fine "demonstrates that the Government means business in enforcing the provisions for the Clean Air Act." [Salpukis, Agis, "Court Fines Ford $7-Million in Suit on Pollution Test," *The New York Times*, February 14, 1973]

By contrast, the National Academy of Sciences released a report on February 16 that concluded the industry probably could meet the 1975 standards. The report, called for under the Clean Air Amendments of 1970, said four types of system could work: a modified conventional engine equipped with an oxidation catalyst, a carbureted stratified charged engine (Honda), a Wankel rotary engine equipped with a thermal reactor (Mazda), and a diesel engine (Mercedes-Benz).

The report said the U.S. industry was concentrating on the most expensive and least satisfactory methods for meeting the standards. Consumer advocate Ralph Nader explained why he thought that might be the case.

> As has been their practice for more than 20 years, the domestic automobile companies once again are mounting an intense propaganda campaign to advertise their "inability" to meet air pollution control standards . . . . What the giant auto corporations say they cannot accomplish in 1975, two small Japanese auto companies have already accomplished. According to official U.S. Environmental Protection Agency (EPA) test results, Honda and Toyo Kogyo have easily met the 1975 standards for 50,000 miles with their respective vehicles, the Honda and the Mazda.

According to Nader, the industry had known since the 1930s that automobile pollution was a cause of the Los Angeles smog problem. When California demanded that vehicles sold in the State come with exhaust controls, the industry said that such equipment would not be feasible until the 1967 model year. "But when California certified the control devices of two non-automotive companies, GM, Ford and Chrysler suddenly announced they could indeed install such devices in 1966 vehicles." Nader indicated that the real reason for the delay was revealed in 1969 as a result of a Justice Department lawsuit against the domestic manufacturers and the Automobile Manufacturers Association for conspiring to restrain development of auto exhaust control systems since 1953:

> The evidence brought together prior to this suit by a Los Angeles grand jury outlined the cross-licensing agreement and other close associations between these so-called auto competitors that forged this illegal, united front of inaction. In September 1969, the domestic auto companies entered into a consent agreement with the government agreeing never to engage in such a conspiracy again.

Now, he said, the companies remained "obstinate to all government pleas," insisting on installing "a less effective but more expensive exhaust control system—the catalyst-equipped vehicle which will carry a gouging sticker price of $230 above the 1970 vehicle price . . . ." He concluded:

> What these corporate mastodons need is more competition from smaller companies and strong antitrust enforcement. [Nader, Ralph, "Detroit's Excuses," *The Washington Star-News*, February 25, 1973]

(A secret Justice Department memorandum, which Nader had obtained in 1971, summarized the conspiracy to suppress development of pollution controls and recommended criminal prosecution. As he said, the memorandum was based largely on a grand jury investigation in Los Angeles, July 1966-December 1967, led by Samuel Flatow of the Department of Justice's Antitrust Division. The memorandum stated:

> Throughout the entire conspiracy, the participants were cognizant of the antitrust implications of their activities. Despite this fact the conspiracy was carried on for economic reasons. The health and welfare of the community were disregarded. In these circumstances criminal prosecution is clearly indicated.

(In January 1969, the Justice Department decided instead to launch a civil conspiracy complaint against General Motors, Ford Motor Corporation, Chrysler Corporation, American Motors, and the Automobile Manufacturers Association. Several smaller manufacturers were named as coconspirators rather than defendants. On September 11, 1969, the manufacturers entered into a consent decree in which they admitted no guilt but agreed not to conspire to obstruct development of pollution control devices. They also promised not to cross-license patents or patent rights, restrict publication of research relating to the devices, jointly assess patents submitted by inventors, or act jointly to file safety data with government agencies. [Graham, Fred P., "U.S. Settles Suit on Smog Devices," *The New York Times*, September 12, 1969; Mintz, Morton, "Justice Dept. Had '68 Memo on Auto Plot," *The Washington Post*, May 19, 1971])

Referring to the new study, an editorial in *The Los Angeles Times* drew a similar conclusion, saying the U.S. auto industry was pursuing a dual-catalyst system "that the academy has criticized for high cost, poor fuel economy and expense of maintenance":

> The blame for that, the academy study says, falls on the industry. The auto makers were extremely laggard in their pollution control and development work, and did not really begin to move until government pressures were exerted. Then they chose to devote their antipollution efforts "almost entirely" to "minimal modifications" of existing engines.

Whether to stick with the industry's current efforts or extend the deadline to give the industry more time to adopt a better option was "as the academy notes, a multibillion-dollar choice." ["A Hard Choice on the Auto Deadline," *The Los Angeles Times*, February 25, 1973]

In California, Senators Cranston and John Tunney, both Democrats, appeared before a Southern California Association of Governments meeting on February 15. Senator Cranston predicted that Congress would divert Highway Trust Fund revenue for rapid transit, while Senator Tunney said he intended to introduce legislation that would divert revenue from the Highway Trust Fund to help develop a smogless alternative to the internal combustion engine. ["Road Use for Fast Transit Forecast," *The Los Angeles Times*, February 16, 1973]

On February 20, the Los Angeles Environmental Quality Board met at Parker Center police headquarters to receive suggestions for alternatives to EPA's drastic plan. An article about the meeting said, "Most said the plan calling for an 80% reduction in vehicle use was too radical and posed a serious threat to the economy." Suggestions included improving the rapid transit system and increasing the use of bicycles. The article said that according to the Southern California RTD, "it would take about 8,000 to 10,000 buses to fill the void created by a reduction in vehicles called for by the EPA plan." ["Alternatives to Gas Rationing Proposed," *The Los Angeles Times*, February 21, 1973]

On the eve of 3 weeks of EPA hearings in the Los Angeles area, reporter Gladwin Hill, who specialized in environmental issues for *The New York Times*, explained:

> Officials of Los Angeles County, which covers the biggest portion of the basin, say that by rigorous regulations going back to 1947 they have reduced smog from stationary sources, such as factories, to only 10 per cent of total air pollution, and that 90 per cent of the smog now comes from automobiles, whose emissions are a Federal responsibility.
>
> Neither local officials nor state officials see any possibility—short of stopping auto traffic entirely—of meeting Federal standards even by 1977. But they foresee, with an ever-increasing ratio of fume-controlled cars, the problem being brought within bounds by 1980 or soon thereafter.
>
> William D. Ruckelshaus, the E.P.A. Administrator, has suggested that one solution for Los Angeles would be to seek a special dispensation from Congress extending the compliance deadline even beyond 1977.
> In a sense, the Los Angeles basin hearings will be an academic exercise, because the Federal antipollution agency has no power to enforce whatever transportation control plan it finally promulgates. The agency is dependent for this on state and local cooperation in adopting the legislative and administrative measures necessary to carry out any plan.
>
> But, in another sense, Mr. Ruckelshaus has said, Los Angeles is a national test case in the willingness of citizens to alter lifestyles to meet air quality standards they have already espoused through their Congressmen. [Hill, Gladwin, "Hearings to Open on Alternative Solutions to Smog Problem in Los Angeles," *The New York Times*, March 4, 1973]

According to Hill, the first day of EPA's hearings "did not evoke a high pitch of civic excitement." He said, "Fewer than 200 people attended the initial session, in the auditorium of the Parker Center police headquarters." State and local officials addressing the forum agreed the region could not meet the standards even by 1977. Hill summarized:

> The consensus of initial witnesses was that blame for one of the nation's worst air pollution problems rests with the automobile industry, and that the Federal Government should be centering its attentions on Detroit rather than Los Angeles.

He quoted Senator Tunney as calling the EPA proposals "a drastic and nonsensical" measure that "would lead to economic and social chaos and be impossible to enforce without putting a bayonet at the back of every motorist." Tunney added that, "Instead of turning to police-state solutions, we should mobilize our effort to develop mass transit and to mass produce an alternative to the internal combustion engine." He explained that, "Detroit, by sticking with the present internal combustion engine, has been trying to saddle a dinosaur." [Hill, Gladwin, "Plan to Cut Auto Travel in Los Angeles Basin Scored at Hearing," *The New York Times*, March 6, 1973]

The second day of hearings brought some optimistic comments. Harold Sullivan of the California Air Resources Board thought the area could reduce automobile travel by 10 to 15 percent by 1977 through extensive use of buses, carpools, and parking restrictions. Land use controls were also a potentially important measure. Larry Moss, the Sierra Club's southern California representative, recommended land use limitations (including zoning controls and embargoes on electricity, gas, and sewage hookups) and controls on shopping centers, sporting arenas, and other crowd-generating venues. Auto travel could be reduced 30 percent, he said, by such measures as increased bus service, exclusive bus lanes and low fares, priority treatment for high occupancy vehicles on freeways, and car-free zones in the city. He also advocated a car tax based on the individual emissions of each vehicle.

By contrast, Donald C. Tillman, the city engineer and president of the Los Angeles chapter of the American Society of Civil Engineers, recommended completing the area's freeway system, coupled with efforts to relieve bottlenecks. He also suggested the area encourage bicycling, implement 4-day work weeks, expand carpooling, and increase rapid transit.

With a mayoral election underway, candidates attempting to defeat Mayor Sam Yorty, who had been a strong backer of freeway construction, appeared before the forum. Jesse Unruh, a former Speaker of the California State Assembly who had lost his 1970 bid to defeat Governor Ronald Reagan, said that trying to attain the 80-percent reduction in auto travel through gasoline rationing as proposed by EPA would lead to "quite possibly a revolution." If implemented, the plan could lead to "armed raids on gasoline stations." He thought a 20-percent reduction might be possible through increased bus service and reduced parking fees for carpools.

Another candidate, City Councilman Thomas Bradley, an African-American former city police officer, commented that "obviously" automobile travel would have to be reduced. [Dreyfuss, John, "Public Will Sacrifice to Fight Smog, Panel Told," *The Los Angeles Times*, March 7, 1973]

On March 9, 1973, *The Los Angeles Times* reported discouraging news for those seeking to cut automobile traffic:

> Downtown Los Angeles is bulging with more people who use cars each day but fewer commuters and shoppers appear to be riding buses to get there, the city Traffic Department reported Thursday.
>
> By 1975, it will be worse. There will be about the same number of persons, but more vehicles will be entering and leaving the Central City, the researchers reported. They said

> the number of vehicular trips by then will equal the postwar peak set in 1957 when there was no freeway loop for motorists to bypass the downtown core.

The report, based on figures compiled in May 1972 from a count at cordon boundaries around a one-square-mile section of the Central City core, found an increase in carpooling "especially among the Civic Center's government workers," but a decrease in the number of people using the area's buses to enter the core (124,226 passengers, down from the previous year's 125,659):

> The cordon count showed that while automobiles account for about two-thirds of the persons entering the downtown area, buses carry 20.7%, down from 21.3% in the previous count. Significantly, however, automobiles account for nearly 89% of the traffic entering the Central City but buses only 1.5%.

The number of pedestrians also was declining, partly due to the loss of apartment houses and other multi-unit structures on the downtown fringe. [Hebert, Ray, "Auto Riders Up in Central City; Bus Use Drops," *The Los Angeles Times*, March 9, 1972]

At the same time, Governor Reagan signed a law creating the California Department of Transportation in the State Business and Transportation Agency, effective July 1. The new department would include divisions of transportation planning, mass transportation, and aeronautics, in addition to absorbing the Department of Public Works that was responsible for freeway development. In signing the bill, the Governor said, "This plan will provide balanced transportation systems consistent with our state's social, economic and environmental goals." He added:

> The new department will be responsible for developing a statewide transportation system based on regional plans submitted by local councils of government or transportation commissions. After public hearings and adoption, regional plans will be brought into the statewide plan with necessary adjustments for inter-regional systems. This will give California a coordinated transportation system that will serve all the people better now and in the future. ["Calif. Bill Sets up State Department of Transportation," *The Journal of Commerce*, March 9, 1973]

The Los Angeles Times observed on March 19 that plans for the area's freeways were slipping:

> Southern California's freeway development program is dying a slow death. Legislative deletions have decimated some routes. Others have been hit by court actions and a financial crunch is threatening still others.
>
> Clearly, the freewheeling, freeway-building days of the early 1960s, when every mile of freshly paved freeway was considered a blessing, are gone.

The article claimed that the "changing mood about Southern California's freeway program" was casting "serious doubt on the future of all routes not yet built." The area's 23 freeways, fully or partly completed, had cost more than $3 billion, but an additional 17 routes had seen "little planning and no construction" thus far. Highway officials were concerned because, as one unnamed State highway official pointed out, this remaining mileage was part of the 1,557-mile network adopted 15 years earlier. "When you start chopping up the system, you defeat its purpose." [Hebert, Ray, "California Freeway Plans Slip," *The Los Angeles Times*, reprinted in *The Washington Post*, March 18, 1973]

The Los Angeles City Council acknowledged on March 19 that the city did not have a satisfactory program to control auto emissions. The council voted 12 to 2 to grant the city's Department of Environmental Quality's (DEQ) request to present suggestions, during testimony before EPA's March 23 hearing, on alternatives to EPA's radical plan for gasoline rationing in the Southern Coast Air Basin. General Manager Jack Green told the council that DEQ had studied several options:

> They include improved public transportation, incentives to discourage auto use, auto-free zones, increasing parking costs, carpooling, exclusive bus and car pool lanes, limitation of second and third-car ownership, limitation of auto registration, exclusive bicycle lanes and "park-and-ride" facilities.
>
> Other studies have been carried out, he said, [of] on-ramp metering on freeways, reduction of speed limits to 55 m.p.h., staggered working hours and a four-day work week.
>
> "The general conclusion of these studies," the report said, "has been that the programs would have only a minimal effect on emission reduction."

The council directed DEQ to inform EPA that the council was awaiting a DEQ proposal for the conversion of city-owned cars to meet the 1975 standards; the city is encouraging improved public transportation, including freeway rampside parking, mini-buses, and incentives for bus use; the DEQ would soon report on the status of the city's 4-day week program and submit recommendations for staggered work hours and a split week; and that the council had instructed DEQ to recommend to the city's Public Health, Welfare and Environmental Committee any Federal, State, and local abatement programs for support by the city.

The plan, said Councilman Arthur K. Snyder, was weak, "but at least it will be better than the city standing mute." [Baker, Erwin, "City Council Approves 'Weak' Pollution Report, *The Los Angeles Times*, March 20, 1973]

Since 1938, the State constitution had limited revenue from the State gas tax to highway construction and maintenance. On March 20, James R. Mills, a Democrat representing San Diego in the State Senate, introduced a constitutional amendment to allow use of some of the $700 million collected annually from the State gas tax for rapid transit construction. Funds from motor vehicle taxes also could be used for control of smog caused by automobiles. Mills, Senate President Pro Tem, had been the author of a similar measure, known as Proposition 18, that voters had rejected in 1970 by a vote of 3,121,611 to 2,648,287. An article about the new measure said:

> Proponents argued in 1970 that rapid transit would reduce air pollution and speed up commuting in large metropolitan areas. Opponents claimed passage would mean a gas tax hike and lessen funds needed to complete the state freeway system.

In 1973, Mills said, the constitutional gas tax restriction "has outlived its usefulness and now threatens to stifle development of balanced transportation systems." Compared with proposition 18, chances for the new measure had improved because, "Californians are demanding that we do more to solve our transportation and air pollution crisis." He added, "We just can't continue to pour all of our gas tax money into more and more freeways. That makes absolutely no sense at all." [Gillam, Jerry, "Senate Gets Measure to Boost Rapid Transit," *The Los Angeles Times*, March 21, 1973]

Also on March 20, Vice President Spiro Agnew was in Los Angeles as the featured speaker during a luncheon at the Los Angeles Convention Center for an international seminar on rapid transit. The focus was on promoting a rapid transit system for Los Angeles, but attendees included representatives from Atlanta, Montreal, San Francisco, and Washington, D.C. The Vice President said the automobile was not a monster, but it could turn into one if cities such as Los Angeles became totally dependent on it:

> We can develop more rational and efficient ways to move around in our cities, and mass transit—whether it be bus, rail or an innovative new system—can free us from automobile servitude.
>
> A decision must be made. People are ready for a change. We see it in the lines of traffic jamming Los Angeles freeways.

The Federal Government was ready to help the Nation's cities, as reflected in Secretary Brinegar's highway and transit proposal to open the Highway Trust Fund to urban bus and rail use. Vice President Agnew also cited the proposal to allow State and local officials to withdraw controversial Interstate segments in favor of other highway or transit projects, a plan that "makes a great deal of sense." He explained:

> Highways are not an end in themselves. Their purpose is to solve the needs of a transportation corridor. If there is a more efficient and effective way, or a combination of ways . . . is it not wiser to give localities real flexibility?

Regarding the Los Angeles area, the Vice President praised bus and rail transit options. A bus could take the place of 30 automobiles, but a rail system was "even more impressive." Building a rail system would take time, but Los Angeles and other cities could take steps to solve some of their transportation and environmental problems in the meantime. Steps included "fringe benefits" for transit riders, such as fare reductions supported by private businesses, as well as auto-free zones and pedestrian malls that would create an incentive for walking.

He also referred to the Pacific Electric interurban rail network that had once served the area before being replaced by a bus system because "the tracks got in the way of the automobiles . . . ." He said:

> Paradoxically, you are now considering ways of re-creating the efficiency and environmental integrity of that system at a cost of several billions of dollars. Perhaps that is an unfair oversimplification, but we have come nearly 180 degrees since those tracks were removed to facilitate automobile traffic. [Hebert, Ray, "Auto May Turn Into a Monster, Agnew Cautions," *The Los Angeles Times*, March 21, 1973]

The EPA hearings ended March 22 after testimony from more than 200 witnesses in nine Los Angeles Basin cities. Ruckelshaus said EPA would review the 3,500 pages of testimony before releasing its own "transportation strategy" for Los Angeles by June 15. Overall, the witnesses generally did not challenge EPA projections, but they did not believe automobile traffic could be cut by the proposed amounts. Gladwin Hill summed up:

> Three weeks of public hearings have convinced Federal aid pollution officials that there is no possibility of imposing a big reduction in Los Angeles Basin auto traffic to clean up the air.
>
> Instead, the Environmental Protection Agency will recommend a combination of less harsh measures, such as improving mass transit, car pooling, "disincentives" to downtown driving and conversion of fleet vehicles to natural-gas fuel. [Hill, Gladwin, "Pollution Aides Doubt Traffic Cut," *The New York Times*, March 26, 1973]

While the hearings were underway in the Los Angeles area, EPA had been holding hearings required by the U.S. Court of Appeals on the auto industry's request to delay Federal emissions standards for 1975 cars. On April 11, Ruckelshaus announced that he had decided to suspend the requirements for the 1975 model year and approve two standards for the country. The stronger standard would apply in California where cars sold in 1975 would be required to have their exhaust systems purified to release no more than 0.9 grams of hydrocarbons and 9 grams of carbon monoxide per mile of travel. For the rest of the country, the second standard limited emissions to 1.5 grams of hydrocarbons and 15 grams of carbon monoxide. The stiffer standards envisioned by the Clean Air Amendments of 1970 would apply to 1976 models (0.41 grams of hydrocarbons and 3.4 grams of carbon monoxide).

Ruckelshaus explained that this two-phase approach would avoid the risk of "societal disruption." An article in *The Washington Post* about the decision stated:

> Ruckelshaus, in explaining his decision, said he had to weigh the symbolic rollback from the act's requirements against the risk of unleashing a political and consumer backlash by forcing Detroit into putting troublesome devices on 1975 automobiles. Such a backlash, he said, might "destroy the momentum" of the effort to clean up the air.

> He said the White House had accepted "with alacrity" his suggestion that it stay out of the decision on Detroit's request to suspend the 1975 clean air requirements for one year. "This is my decision," he said.

Ralph Nader immediately denounced the decision. He charged that "once again the concessionaires within the Nixon administration have sold out the environment to industry polluters."

The four Detroit-based auto manufacturers (General Motors Corporation, Ford Motor Company, Chrysler Corporation, and American Motors Corporation) expressed concern about the technology available for meeting the interim standards for 1975 and its cost. General Motors' chairman, Richard C. Gerstenberg, said "we are disappointed and dismayed by the decision of the EPA. While the 1975 standards, as originally established, have been delayed for a year, the interim standards will be most difficult to attain and may well require the use of costly catalytic converters nationally." Henry Ford II said that "on the basis of what we know now, the requirements for 49 states are so tough as to make it extremely doubtful that we can meet them across the full range of all production without the use of expensive, untried catalysts." Chrysler considered the standards "beyond our present non-catalytic capability," while American Motors called the ruling "regrettable." [Wilson, George C., "Auto Makers Win Delay on Clean Air," *The Washington Post*, April 12, 1973; and Salpukas, Agis, "Detroit Unhappy with E.P.A. Action," *The New York Times*, April 12, 1973]

(The original standards had been developed by Delbert Barth of the National Air Pollution Control Administration in the Department of Health, Education, and Welfare, but based on the state of technology, he proposed them for 1980 vehicles. The Senate Committee on Public Works, with strong encouragement from Senator Muskie, applied the standards to 1975, in effect legislating technology. [Train, Russell E., *Politics, Pollution, and Pandas: An Environmental Memoir*, Island Press/Shearwater Books, 2003, p. 167])

The media understood Ruckelshaus' position. "Rather than risk widespread economic disruption," a *New York Times* editorial stated, "by insisting that all the standards be met for 1975 models, he chose to postpone their full impact to 1976." Unfortunately, the editorial added, "the Administrator lacked the authority to require the car manufacturers to use their grace period for developing a better approach, for example, a counterpart of the Honda engine . . . ." *The Washington Post* called it a "realistic decision, the best choice that could have been made from among a number of unattractive alternatives." It said that Senator Muskie was threatening congressional action to impose engine design and efficiency standards on the auto industry. "It is not an idle threat" since foreign auto makers had met the standards. "What Muskie and others are demanding to know is why Detroit has failed to exploit that technology, to the coming detriment of car buyers and of air quality." ["Year's Grace," *The New York Times*, April 12, 1973; "Car Deadline: Reality and Discontent," *The Washington Post*, April 12, 1973]

Similarly, *The Wall Street Journal* applauded the EPA decision and criticized the automakers for "embarking on a campaign to persuade Congress to roll back those standards . . . ." Instead, they should "demonstrate good faith" instead of "swarming over Capitol Hill, taking full-page advertisements, and having vice presidents fan out over the countryside making speeches denouncing the standards." Admittedly, "environmental zealots" wanted to "punish Detroit for past sins even more than they would like clean air." They may make "the loudest, most irritating noises," but that was no reason for the auto industry to "react in kind." Americans would be willing to "make accommodations along the way as long as it feels in its bones that the manufacturers are trying." ["A Matter of Emphasis," *The Wall Street Journal*, April 13, 1973]

(Flippen, in his book about President Nixon's environmental actions, provided an historical viewpoint that was not available to reporters at the time:

> In the year since the original denial, science had developed adequate catalyst technology on prototype cars. Because the cost of expanding this technology to mass-produced models was extensive, the companies argued that the necessary technology was unavailable, a conclusion that environmentalists vigorously challenged. General Motors Corporation, anxious to curry favor with the administration and improve its image with the public, offered a solution: interim standards establishing a two-tier system. California, GM suggested, would have to meet the rigid EPA standards and thus require catalysts on all models. The rest of the nation would only have to meet 50 percent of the standards. This allowed more time for study while making the effort feasible for the companies. The proposal constituted a significant weakening of the law, but Nixon insisted that EPA accept. "Pull Ruckelshaus in when he goes too far," Nixon wrote an aide upon hearing of the offer. "I want sympathetic consideration of this request." Under pressure, Ruckelshaus announced in early April that EPA agreed. The issue was "terribly complex," Ruckelshaus tried to explain. It was inexcusable, the National Resources Defense Council replied. The administration had "sold out to big business" . . . .
>
> It was for the companies only a matter of the bottom line; had EPA not forced them to spend the necessary money, the nation would have paid the price in its air quality. It was indeed complex, but Nixon's order to compromise was more in the interest of the auto industry than the nation's air.
>
> It was also, the White House calculated, in its own political interest. The companies unleashed a furious public relations campaign to convince Americans that the rigid standards necessitated a dramatic increase in the price of a new car. Company engineers insisted that the cost would rise by an average of almost one thousand dollars, a figure outrageously high. They also maintained that fuel efficiency would suffer, that cars with catalysts would consume more gas and thus cost consumers an additional two hundred dollars annually. Environmentalists and their champions on Capitol Hill did their best to counter such claims . . . . It was, however, a tough argument to debunk, as the White House knew. [Flippen, p. 192-193])

Mayor Yorty, who had become Mayor on July 1, 1961, had defeated Councilman Bradley in the 1969 Democratic primary by claiming the former police officer was a Black Power-type radical. Now, in 1973, Bradley was again challenging Yorty, but with rapid transit a key issue. On April 18, Bradley met with the press about 90 minutes before Mayor Yorty's weekly news conference. This was part of Bradley's new strategy of taking the initiative from the Mayor, who had been using his news conferences to make charges against his opponent. On this day, Bradley said, "We've got to get on with the matter of rapid transit," adding:

> You know, Sam Yorty seems not to recognize that we have a rapid transit problem and perhaps that's true because he flies about this city from home to work or other places in a $150,000 helicopter, paid for by the taxpayers of this city. Now, while he's flying overhead, we're stuck on our overcrowded freeways, unable to move."

He cited his own actions in support of rapid transit. He led the fight to get the State Legislature to provide funds, $4 million a year, for the first leg of a rapid transit system (Yorty had tried to transfer the funds to nontransit needs). He supported setting aside freeway lanes for exclusive use by buses, known as "freeway flyers" (Yorty "hasn't opened his mouth or lifted his finger to do anything about it"). He had proposed a successful mini-bus plan ("not a word from" Yorty in support) and attempted to break the Yellow Cab monopoly ("Sam Yorty's commission has blocked that effort"). Bradley said he also had been involved in the fight in Congress to break open the Highway Trust Fund for mass transit ("not a word from Sam Yorty on that issue.").

Los Angeles, Bradley said, ranked 20th among the 21 major recipients of Federal transportation funds on a per capita basis. "It's time that this city had a mayor who would not simply fly above (the traffic problems), or fly away from them, but who would care about all the people of this city, who would begin to deal with the problems that face us."

Mayor Yorty, in his news conference, denied all the "wild charges" and said he was only addressing the point because, "I'm trying to clear up a little confusion based on demagoguery." He had backed rapid transit, and Bradley knows it, so "rapid transit is not an honest issue in the mayoralty race." As for the allegation about the helicopter, "Everybody knows that isn't true. He doesn't seem to care what he says." As he had in 1969, he accused Bradley of trying to become Mayor so he could "get control" of the police department. (*The Los Angeles Times* had looked into the helicopter issue some time ago. Based on a review of departmental records, the newspaper found that Mayor Yorty rarely used the helicopter to commute, but did use it to keep speaking engagements and reach other events around the State.) [Reich, Kenneth, and Bergholz, Richard, "Bradley Accuses Yorty of Failure on Rapid Transit," *The Los Angeles Times*, April 19, 1973]

Senate Concurrent Resolution No. 6

While completing work on S. 502, the Senate Committee on Public Works approved Senator Baker's Senate Concurrent Resolution No. 6 to allow Secretary Brinegar to apportion $1 billion of Interstate funding on the basis of the 1972 Interstate Cost Estimate. Senator Baker brought the resolution to the Senate floor on March 6.

It was, he said, "an emergency measure designed to assure that interstate highway funds continue to be available for obligation by the States without interruption." The failure of the Federal-Aid Highway Act of 1972 left many States without Interstate funds. Virginia had no funds left, while eight States had less than $5 million available. Seven States had between $5 million and $10 million available while five had between $10 million and $20 million. With the spring construction season about to get underway, "these States are in immediate need for fiscal year 1974 apportionments."

Senator Baker pointed out that the resolution enjoyed support from the Nixon Administration, but "will become effective immediately upon passage by the House without Presidential signature." Senator Bentsen said that S. 502 involved a number of controversial measures that would take time to resolve, but in 1972 and again in 1973, there was "no controversy" over continuing development of the Interstate System. Some controversy did exist about the appropriate funding level. While that issue was resolved, Senate Concurrent Resolution No. 6 involved only a portion of the funding:

> Although the full amount authorized for fiscal year 1974 is presently $4 billion, the committee chose to apportion only $1 billion at this time for several reasons. The availability of $1 billion would permit the States to award construction contracts this spring at the beginning of the construction season when activity of this type normally is greatest. Further, the committee did not believe it would be wise to apportion the full amount since we are now considering a reduction in the annual authorization for interstate construction.

He emphasized that adoption of the resolution would "in no way impair the ability of the Congress to enact a new general highway bill," adding:

> It has been considered by some that the urgent need for interstate funds would be an incentive for prompt action on the bill. The committee considered this situation in deciding to apportion only $1 billion at the present time. The continued nonavailability of the remainder of the fiscal year 1974 funds should remain as one of the encouragements for prompt action, but reduce the pressure sufficiently to prevent us from being rushed more than is necessary for the thoughtful deliberations that are required on the highway transportation issues we face this year.

Senator Randolph concurred:

> While the Congress works to produce a new general highway bill, there could be widespread unemployment in the highway construction industry and severe disruption of State construction schedules. At the same time, continuing inflation would push the ultimate cost of the system to new highs.

Without a recorded vote, the Senate approved Senate Concurrent Resolution No. 6. [*Congressional Record-Senate*, March 6, 1973, p. 6431-6433]

The Senate Committee on Public Works Bill

On February 28, Secretary Brinegar wrote to let Senator Randolph know the Department of Transportation's views on S. 502. The Secretary stated that the Federal-Aid Highway and Public Transportation Act of 1973, S. 967, introduced a week earlier, reflected the Administration's position. He believed that "its enactment would go a long way toward solving some of our Nation's major transportation problems." However, S. 502 included "a number of the constructive measures" that had been included in the 1972 legislation the Senate had approved.

The most important issue was whether "the bill will be amended to provide our State and local officials with a full range of options as they attempt to solve their transportation problems." He rejected the "arbitrary limitation" on the options for highway-related mass transit:

> In my testimony before your Committee, I made the point that the taxes which accrue to the Highway Trust Fund are quite general in their incidence and predate the establishment of the Trust Fund. To treat these taxes as specific user charges and to insist for that reason that their revenues cannot be invested in rail transit facilities or equipment is to sharply impair the ability of State and local officials to grapple with the complexities of today's urban transportation problems . . . . S. 967 goes much further and provides the flexibility we believe essential to the solution of our transportation problems.

Secretary Brinegar also had some concerns about modifications in the pass-through provision. The original version made Federal-aid urban system funds available to urbanized areas, but the present version earmarked the funds for incorporated municipalities with populations in excess of 400,000:

> Under such a provision, funds for an urbanized area that were attributable to suburban areas would be held at the State level while funds attributable to the major city would be first, earmarked for that city and second, made directly available to them if they were suitably equipped to carry out the program . . . . Such an action would constitute the severest setback to our efforts to encourage State and local officials to approach urban transportation problems on an areawide basis.

He strongly opposed the revised measure and urged the committee to return to the original version.

He recommended that Federal-aid urban system funds be limited to areas with populations of 50,000 or more, instead of 5,000 as in the bill. In addition, he suggested combining Federal-aid urban system funds with funding for the urban extensions of the Federal-aid primary system. Retaining the separate funding categories "will result in duplication and unnecessary administrative complexity."

The Secretary approved the committee's efforts to consolidate some categories, but opposed its retention of the Special Urban High Density Traffic Program at $50 million. "We believe that roads of this type can be constructed under existing programs and would recommend the deletion of the new grant program."

The provision allowing Federal-aid funds to be used for construction of parking facilities inside central business districts was a concern because it did not require that they be located and designed in conjunction with public transportation facilities. "We believe there is no justification for Federal funding unless such facilities are part of a public transportation program."

He also was concerned about the toll road reimbursement program, which would permit the States to commit future Federal-aid primary funds far in advance of Federal-aid authorizations and receipt of tax revenues. "The program has always operated on a pay-as-you-go basis and we recommend that this principle not now be abandoned."

The exemption for the North Expressway in San Antonio was "neither good government nor conducive to preservation of the environment that all have accepted as a primary national goal." [*The Federal-Aid Highway Act of 1973*, Report to Accompany S. 502, Committee on Public Works, United States Senate, 93rd Congress, 1st Session, S. Report 93-61, March 13, 1973, p. 45-47]

The Department's bill, however, had been introduced too late for any real committee consideration.

On March 1, the Senate Public Works Committee rejected, 6 to 8, the Muskie-Baker amendment to open Federal-aid urban system funds to rail transit. Senator Muskie was optimistic that the amendment would be approved on the Senate floor. Recalling the 48 to 26 vote approving the Cooper-Muskie Amendment in 1972, he said, "We had a good margin last year and I hope we do as well this time." ["Mass-Transit Backers in Senate Lose Bid to Tap Road Fund But See Eventual Win," *The Wall Street Journal*, March 2, 1973]

The committee also rejected Senator Muskie's amendment to modify the pass-through provision to allow funds to go to cities of 250,000 population, instead of 400,000. In addition, the committee rejected his motion to increase Federal-aid urban system funding from $650,000 to $1 billion, but accepted Senator Randolph's substitute to increase funding to $850 million.

In other committee votes, Senator Buckley moved to strike the provision dealing with the North Expressway in San Antonio, but the motion failed. The committee adopted a measure introduced by Senator Burdick that each State should receive a minimum of one-half of one percent of the Interstate apportionments for FYs 1974, 1975, 1976. This measure was intended to ensure that States such as Delaware, Nebraska, and Burdick's own North Dakota that would finish their Interstate mileage over the course of the bill would not be denied Interstate funding. [*The Federal-Aid Highway Act of 1973*, S. Report 93-61, p. 43]

The committee approved the bill on March 1 by unanimous voice vote. Aside from the usual funding provisions, the bill included:

- Funds for Forest Highways would come from the Highway Trust Fund as in the 1970 Act, as would funds for parkways and Indian Reservation Roads for the first time. Funds for forest development roads and trails, public lands development roads, and park roads and trails would come from the general Treasury.
- Continued the Federal share of 70 percent for non-Interstate projects.
- The Secretary was to administer the Federal-aid highway program to "encourage the minimization of paper and interagency decision procedures and the best use of available manpower and funds so as to prevent needless duplication and unnecessary delays at all levels of government.
- The Federal-aid systems would be realigned based on anticipated functional use in 1980. The Federal-aid primary system would consist of rural arterial routes and their extensions into or through urban areas; the Federal-aid secondary system would include rural major

collector routes; access roads to airports would be eligible to be included in the Federal-aid secondary system. The Federal-aid urban system would include urban arterial and collector routes, exclusive of extensions of rural arterial routes through urban areas; it also could include access roads to airports and other transportation terminals.

- At the request of a Governor and the local governments concerned, the Secretary could withdraw approval of any Interstate segment if the route is not essential to completing a unified and connected system within a State. Dollar-for-dollar substitution of an essential connection would be permitted without restriction on length. The existing 200-mile limit for substitute routes, known as Howard-Cramer mileage, would be repealed.
- If a substitute connection were not needed, or if the cost of the connection were less than the cost of the original route, the total amount of the difference would be available for use on the Federal-aid urban system or for local public transportation purposes under Section 142 of Title 23.
- States must notify the Secretary by July 1, 1974, of their intent to build remaining Interstate segments. By July 1, 1975, States must submit a schedule for completing their remaining segments (including alternate segments). Otherwise, segments would be removed from the System.
- States could employ Certification Acceptance for all non-Interstate projects.
- The existing authority of the States that issued bonds to construct projects on the Federal-aid primary system, including the Interstates, was extended to allow use of Federal-aid funds to retire not only the principal of such bonds, but the interest in the case of the Interstate System.
- Any toll road included in the Interstate System that becomes toll-free would be eligible for Interstate funds for construction, reconstruction, or improvement.
- The States would make Federal-aid urban system funds available for use in urbanized areas of 400,000 or more population, with the amount based on population. If the Secretary of Transportation finds that the municipality had sufficient authority to develop and implement a plan for expenditure of funds for the urban system and related highway public transportation purposes, the State must pass the funds through the funds to that municipality.
- Allowed construction of publicly owned parking facilities in the central business district and the imposition of parking fees to repay bonds or other obligations used for the local share.
- Federal-aid highway funds could be used for highway public transportation purposes within urban areas. Eligible activities included construction of exclusive bus lanes, traffic control devices, passenger loading areas and facilities, and the purchase of passenger equipment other than fixed rail for use within such areas. Interstate funds could not be used to purchase buses, but could be used for exclusive or preferential bus, truck, and emergency vehicle routes or lanes. Buses must meet emission standards prescribed by the EPA.
- Federal-aid funds could be used to develop and improve bicycle transportation, equestrian trails, and pedestrian walkways on or in conjunction with highway rights-of-way. Eligible activities included separate or preferential bicycle lanes or paths, bicycle traffic control devices, bicycle shelters and parking facilities, pedestrian walkways, and equestrian trails. Projects must be part of an overall plan providing for safety and for contiguous routes.

- The Secretary could reimburse States with Federal-aid primary funds after they have received their final Interstate apportionment for 70 percent of the construction cost for new toll roads and improvements to existing toll roads. All toll revenue would be devoted to retiring bonds while also covering operating and maintenance costs.
- Authorized $50 million for construction of special highways connected to the Interstate System in portions of urbanized areas with high traffic density. The Federal share of Special Urban High Density Traffic Program projects would not exceed 90 percent.
- Authorized $15 million for access highways to public recreation areas on Federal lakes.
- Provided for construction of the Highland Scenic Highway as a parkway from West Virginia State Route 39 to U.S. 250 near Barton Knob.
- Provided for relocation of U.S. 25E through a tunnel to be constructed in the Cumberland Gap National Historical Park.
- Authorized over $58 million for reconstruction of the Alaska Highway.
- Increased authorizations for construction of two bridges on Federal dams on the Arkansas and Tennessee Rivers in the vicinities of Fort Smith, Arkansas, and Chattanooga, Tennessee.
- Required feasibility and necessity studies for five specified routes proposed for inclusion in the Interstate System.
- Terminated the San Antonio North Expressway as a Federal-aid project upon the return of Federal-aid funds paid to the State of Texas for that purpose.
- Funded demonstration projects in Lincoln, Nebraska; Elko, Nevada; and Brownsville, Texas, for the relocation of railroad lines from the central city to eliminate rail-highway grade crossings.
- Funded a rural highway public transportation demonstration program to include traffic control devices, passenger loading facilities, fringe and corridor parking facilities to serve mass transportation passengers, and the purchase of passenger equipment other than railroad rolling stock.
- Directed the Secretary to complete by October 1, 1973, the draft environmental impact statement on I-66 in Virginia from the Capital Beltway to the Potomac River. By December 31, 1973, the Secretary must complete review of all public hearing comments and file the final environmental impact statement and make the final determination on whether the project may proceed. The Secretary's decision would be conclusive. [The Federal-Aid Highway Act of 1973, Report of the Committee on Public Works, United States Senate, 93d Congress, 1st Session, Report No. 93, 61, March 13, 1973]

On March 4, President Nixon gave a radio address to the Nation in advance of his State of the Union Message on Community Development:

> A few years ago we constantly heard that urban America was on the brink of collapse. It was one minute to midnight, we were told, and the bells of doom were beginning to toll. One history of America in the 1960's was even given the title "Coming Apart."

Many of the problems that prompted that concern had been addressed. "Today, America is no longer coming apart." Crime was down as were civil disorders and substandard housing. "The air is getting cleaner in most of our major cities." Cities were no longer on the brink of financial catastrophe, the business world was investing in downtowns, while, "The Nation's first new transit system in more than 20 years has just been opened in San Francisco. Another is under construction in Washington, D.C.; others are planned in Atlanta and Baltimore." He continued:

> What does all this mean for community life in America? Simply this: The hour of crisis has passed. The ship of state is back on an even keel, and we can put behind us the fear of capsizing.

One reason was that the Federal Government no longer thought it "should take the lead in developing local communities." America, the President told the Nation, "is still recovering from years of extravagant, hastily passed measures, designed by centralized planners and costing billions of dollars, but producing few results."

He discussed the General Revenue Sharing Act he had approved at Independence Hall in October 1972 and promoted the Better Communities Act, which would provide $2.3 billion in its first year of operation with no strings attached. He also cited the proposal to establish a Department of Community Development and pointed out that he had taken a first step by appointing Secretary Lynn as the Counsellor to the President for Community Development.

Turning to transportation, he said that over the past 20 years, "Federal money has helped build the world's best system of modern highways." But the time had come to "concentrate on moving people within cities as effectively as we move them between our cities." The focus must be on helping "communities develop urban mass transit systems of which America can truly be proud." He explained his plans:

> I propose that our States and communities be given the right to use a designated portion of the Highway Trust Fund for capital improvements in urban public transportation, including improvements in bus and rapid rail systems.
>
> Changing the way we use the Highway Trust Fund should be one of the top items on our national agenda. If we do not act now, our children will grow up in cities which are strangled by traffic, raked by noise, choked by pollution.
>
> By opening up the Highway Trust Fund today, we can open up great new vistas for our cities tomorrow.
>
> I have also asked that Federal funding authority for mass transit capital grants be doubled—from $3 billion to $6 billion. And I recommended that the Federal share of mass transit projects be raised to 70 percent.
>
> All of these steps will help us meet the challenge of mass transit.

He concluded his radio address:

> If the spirit of community means anything, it means a spirit of belonging, a spirit of responsibility, a spirit of participation. Restoring this "spirit of community" is the ultimate purpose of all the community development efforts of our Administration.
>
> "A great city," Walt Whitman wrote, "is that which has the greatest men and women." Only by appealing to the greatness that lies within our people can we build and sustain the kind of communities we want for America.

President Nixon would repeat his recommendations in his March 8 State of the Union Address on Community Development as discussed earlier.

On March 8, Secretary Brinegar addressed the National Newspaper Association. He emphasized that President Nixon "believes quite strongly that decision-making authority should be returned to the people—to the community—as much as possible, along with the funding to help those decisions to work." The enhanced prospect for moving decisions back to the communities to improve transportation was "the kinds of 'good news' that are so often hard to find in any newspaper."

Everyone, he said, agreed on the importance of transportation. "It's certainly no great discovery to observe that transportation changes the land around it and, in turn, is then changed by the changes." He illustrated with an example from American history:

> How many of our cities began as "Tank Towns" and "Whistle Stops"? Or "Portlands" or "River City Junctions"? And our way of living is still being shaped by transportation. Huge shopping centers appear because of beltways and bypasses, not vice versa. Thus, we see that transportation planning and policy making is a complicated interrelated affair.

Today, "the very popularity of the car, at least as we now know it, is threatening its utility." If, as the President says, "we must do a better job of community development," that translates "to a significant degree, to better transportation development." Transportation decisions affect, and are affected by, land use policies, the economy of the community, and its desirability as a place to live and work. The Department's 1973 Highway and Transit bill, he said, embodied the types of changes he was encouraging Congress to enact.

The country had done a good job with the Interstate System, but now was the time "to bring our urban mobility up to the standards we have come to expect in Interstate travel." The keys were "flexibility," not inflexibility, and "intelligent resource usage," not just using dollars on a "use it or lose it" basis:

> The era for the "sugar bowl" type financing that inflexibility encourages should be over. It's a luxury we can ill afford as we try to use the nation's resources as intelligibly [sic] as possible.

While summarizing the provisions of the Department's bill, he endorsed the Muskie-Baker amendment and said:

> This amendment is in no way a "raid" on the Trust Fund. It is a logical use of the monies to meet pressing transportation needs that are quite related to past uses. The amendment does not affect the amount of money going to any state, but only offers some new options on its use.

The Senate Takes Up The 1973 Act

The Senate began considering the Federal-Aid Highway Act of 1973 on March 14. Peter Braestrup of *The Washington Post* reported that the pro-highway and pro-transit forces predicted close votes on the controversial amendments that would permit the use of Highway Trust Fund revenue to build subways and buy buses. "Major issues and pet projects have made the three-year, $18 billion measure the focal point for considerable behind-the-scenes lobbying."

Senator Randolph planned to lead the opposition to the Muskie-Baker amendment with the backing of such groups as AASHO, HUFSAM, and American Trucking Associations. The Muskie-Baker amendment had the support of the Nixon Administration, Mayors, the public interest group Common Cause, unions such as United Auto Workers and the Teamsters, and "most actively," the Highway Action Coalition. Braestrup recalled the vote, 48 to 26, on the similar Cooper-Muskie amendment in 1972, but both sides expected the vote to be closer in 1973, perhaps with only a six-vote margin:

> John Kramer, chief lobbyist for the environmentalist coalition, said yesterday that most of those senators absent from last fall's vote were pro-Randolph men, so those results were somewhat misleading as to true Senate sentiment. "The outcome in the Senate," Kramer predicted, "will have an important psychological effect on the House side"—where the administration's "bust-the-trust" drive faces stronger opposition.

Randolph, Braestrup wrote, had endorsed Senator Williams' Emergency Commuter Relief Act, which was going to be offered as an amendment to the Federal-Aid Highway Act of 1973. It would authorize an additional $1 billion a year for UMTA programs and $400,000 a year for operating subsidies, with all the funds from the general Treasury. "Randolph has endorsed the Williams amendment—partly to offset arguments that, by defending the Highway Trust Fund, he is 'anti-transit.'"

The reporter also cited the Kennedy-Weicker amendment to open non-Interstate funds to bus and rail transit. This was, of course, a more radical proposition than the Muskie-Baker amendment. The prospects were not good since as Braestrup pointed out, the 1972 version of the amendment received only 18 votes.

Braestrup also mentioned another controversial amendment:

> Last but not least of the major amendments is Sen. Clifford Hansen's proposal to lift all federal weight and size curbs on trucks using the Interstate system. This proposal is favored by Randolph but not by Muskie, the American Automobile Association or the environmentalists. [Braestrup, Peter, "Narrow Vote Seen in Senate on Roads Bill," *The Washington Post*, March 14, 1973]

In an introductory statement, Senator Bentsen explained that the bill was in some ways similar to the 1972 bill that the Senate had passed. However, with additional time to consider the issues, the Public Works Committee had improved on that bill. "So, while some of the issues are the same as in 1972, our responses to them are, in several cases, different."
One major difference was that it covered 3 fiscal years instead of the traditional 2. "Had the committee reported a 2-year bill this year, it would have meant that highway legislation would have to be considered again in 1974, almost before the present legislation was fully implemented.
Given the importance of the Interstate System, Senator Bentsen explained why authorizations had been reduced from $4 billion authorized in recent years. The reduced amount "is adequate for orderly continuation of the program as its present stage and will not work an undue hardship on any state's highway activities." Because of impoundments, the amount was more than had actually been made available and more than the President's budget proposal of $2.6 billion a year.

Even with the $16 billion authorized by the new bill, the Interstate System would not be completed until about 1982. He pointed out that while construction time would have to be extended, "the cost of the system also has grown and today stands at more than $73 billion." Under current legislation, the next Interstate Cost Estimate was due in 1974, but the new bill would change that date to 1975 when "we will be in a better position to make a determination on the final cost and completion date of the system."

One reason the Interstate System was behind schedule was that it included many controversial segments that had been held up for several years. He described the Interstate transfer and substitution provisions:

> The bill revises the statute to permit interstate transfers on the basis of cost rather than mileage . . . . In this connection, the bill also provides that where State and local officials determine that an interstate link is no longer desirable, it can be removed from the system entirely so long as the removal does not leave a gap in the total nationwide Interstate System. In both cases—Interstate transfers or total removal of a segment—any funding remaining would be transferred to the urban system apportionment for the urban area concerned.

He stated that 56 urbanized areas with populations of 400,000 or more were eligible to receive Federal-aid urban system funds attributable to them on the basis of the relationship their population bears to the State population. Cities of 400,000 or more within those urbanized areas were eligible to receive pass-through funds:

> This means that the cities themselves rather than the State highway departments would carry out urban system programs if they quality as pass-through recipients. To qualify, the cities would have to have the legal authority under their State laws, and would have to demonstrate to the Secretary of Transportation their competence to carry out an urban highway program.

The committee, Senator Bentsen said, had spent more time on the urban funds than any other, but the most controversial element of the discussion involved the use of Federal-aid highway funds for public transportation:

> The committee is aware that there is a strong relationship between the highway program and public transportation. In recent years that relationship has been given emphasis by programs to construct preferential or exclusive bus lanes and such other facilities as fringe parking, first as demonstration programs, and later as permanently authorized activities.
>
> S. 502 proposes to broaden this relationship by authorizing the use of urban system and urban extension funds for public transportation purposes, including the purchase of equipment. The key issue in this section, and the one which has precipitated much controversy, is the limitation on equipment purchase to that which is highway-related. Rail transit equipment is specifically excluded.
>
> As it did last year, the subcommittee and the committee gave very careful consideration to the public transportation needs in American cities. Once again we concluded that the highway program could be used to help meet these needs by restricting its involvement to public transportation which is highway oriented.

He pointed out that rail transit was assisted through UMTA programs, which were far more effective than funding from the highway program:

> The limitations of apportionment formulas utilized by the highway program would prevent any city from receiving a significant amount of assistance for very expensive rail construction. On the other hand, the proposals of S. 502 would relieve some of the pressure on the urban mass transit program and consequently make more money available from this source [UMTA] for rail construction.

Regarding the provision on the North Expressway, he said, "This action was requested by the State and local governments so that they might complete the expressway with wholly local funds if the project meets local standards."

After summarizing other provisions of S. 502, he concluded:

> S. 502 continues the evolution of the program that began when it was first adopted in 1916. A great part of the success of the federal-aid program certainly is due to the continued vigilance of the Congress and to the adaptability that regular reviews of the program have fostered.
>
> Highway transportation is essential to the continued growth and prosperity of our country. It is a basic form of transportation and will continue to be such in the foreseeable future. [Federal Aid Highway Act of 1973, *Congressional Record-Senate*, March 14, 1973, p. 7890-7892]

Senator Randolph said of the bill:

> To say that this is a comprehensive bill is, of course, the truth. To say that it is an innovative bill is also the truth. To say that it is a bill that meets the challenge of our changing times is true.

He quickly began a defense of the Highway Trust Fund. Congress, he said, "did not approve an abstract concept" in 1956. It approved construction of the Interstate System "so that the mobility of America might continue to expand, so that the products of its factories could move to the cities, so that the products of its farms could move to the consumers, and that Americans generally would benefit." No one could deny that the Interstate System had benefited every State.

In his years in the House and now the Senate, he had been involved in the development of highway legislation and seen many changes that kept the Federal-aid highway program "abreast of the times." He continued:

> Seldom, however, had I been involved in the development of highway legislation that has stimulated both the public and congressional concern as has the bill before us. The success of the highway program in recent years has solidified the American public's preference for motor vehicles as its primary form of transportation. The highway program, as a result, has been subjected to careful scrutiny concerning the role it plays in American life.

The new bill was based on "our continuing experience in the Senate," and "addresses contemporary needs, and does so in a responsible manner." It "neither maintains the status-quo, nor makes changes intended to be permanent in the future."

After defending several special interest provisions, including the Highland Scenic Highway in his home State, he concluded:

> [The] Federal-Aid Highway Act of 1973 is the product of a careful evaluation of America's highway transportation needs. When the Federal-aid program was begun 57 years ago, these needs were relatively small. In 1973, they are vastly more complex and I am convinced this bill is the mechanism by which these needs can be met. [*Congressional Record-Senate*, March 14, 1973, p. 7893-7894]

After further introductory discussion, Senator Cranston was the first to address the key issue. He praised the bill for addressing the very critical needs of the cities "to some extent." The bill, however, "falls far short of meeting the critical transportation needs of our cities." He explained:

> Urban and intercity transit systems are faced today with crippling financial difficulties and their plight is worsening. Since the establishment of the highway trust fund in 1956, a total of 268 city transit systems have gone out of business, and 100 of these have folded since 1963. As freeways are built to accommodate the suburban commuter, those left behind in the cities—most often the very young and the very old, the handicapped and the poor—are left without a means of transportation and must absorb the increasing social costs associated

> with the inner city deterioration. Today, only 7.3 billion transit passengers are carried annually as opposed to the 23 billion carried in 1945.

UMTA funding was helpful, but he discussed the 30 to 1 disparity in funding for highways compared with transit:

> To begin to move toward the development of clean, efficient, nonpolluting, and energy conserving mass transit, we must recognize that our total surface transportation resources are finite and that we must, therefore, reallocate some of the funds currently allocated for highways to mass transit.
>
> Today, the Senate will have three opportunities to provide more adequate funds for public transportation.

They would be the Kennedy-Weicker and Muskie-Baker amendments and an amendment to be introduced by Senator Williams. These amendments were "critically important to California and to the Nation." He mentioned the public hearings that EPA was conducting in Los Angeles regarding the proposal to institute gasoline rationing and other severe measures. The EPA plan, in the absence of an adequate public transportation system, "would wreak economic and social havoc on the Los Angeles area." Some 66 metropolitan areas faced similar restrictions before they met EPA air quality standards.

He quoted the Highway Action Coalition's testimony to demonstrate the superiority of transit to the automobile ("Per passenger mile, a car consumes five times as much fuel as a train, and six times as much as a bus."). The air and noise pollution of the automobile "are reaching unbearable levels," with the brunt of these problems falling on those left behind by the suburban exodus, namely the old, the poor, and the handicapped. "The highway user and the city dweller alike will benefit from a vigorous Federal effort to develop viable transportation alternatives to the automobile." He urged his colleagues to support the three amendments. [*Congressional Record-Senate*, March 14, 1973, p. 7895-7896]

Senator Williams introduced the first amendment, his Emergency Commuter Relief Act amendments to the Urban Mass Transportation Act of 1964. After it was entered into the record, the Senator asked that Senator Kennedy and Weicker be added as cosponsors. When that was done, Senator Bentsen asked that he be included, and that was so ordered.

Senator Williams explained that the Senate had approved this amendment in 1972 on "several occasions." He yielded to Senator Javits, who recalled that he was a proponent in 1972 and cosponsor in 1973. "The time for responsible congressional action is now if the present picture of our mass transit systems is . . . one of rising fares, increasing deficits, and declining ridership to that of a financially sound and viable transportation operation." Senator Javits emphasized the key provisions, including $800 million over 2 years for operating subsidies and a $3 billion increase in contract authority for the UMTA capital grant program through FY 1977:

> It is now up to the Congress to seize the initiative before it. The more than 70 percent of the Nation's people suffer from crippling and decaying mass transit and commuter systems and cannot bear the continued delay over needed Federal assistance.
>
> Mr. President, we are subsidizing airlines, railroads, ships, housing, and numerous other programs, but I know of no subsidization more indispensable to the life and environment of the increasingly city dwelling American people than this kind of buttressing which is called for by this amendment.

Senator Williams added that, "three times the Senate has responded by overwhelmingly passing legislation which would not only provide for the future of mass transit, but which would also enable it to survive its present crisis." The 91st and 92nd Congresses had passed the bill as part of the housing bill and as an amendment to the Federal-Aid Highway Act of 1972. "But each time the legislation failed short of final enactment."

The Emergency Commuter Relief Act was designed to meet the overwhelming need:

> It is designed to halt the raising of fares to intolerable levels, and the curtailment of essential transit services.
>
> It recognizes that mass transit is the lifeblood of an urbanized society and that a program of capital grants meshed into one of operating assistance can go a long way toward alleviating the distress of both private transit operators and the increasing number of municipalities who own and operate systems.

He concluded:

> During the 4 year delay in enacting this legislation, costs have risen, fares have increased, and services have been curtailed and as a result, more and more transit riders have been forced to use automobiles.
>
> And while expenditures have been held in check, transit plans and projects that are urgently needed in urban areas have piled up and gathered dust . . . .
>
> By adopting the Emergency Commuter Relief Act, we in the Congress will by our deeds explicitly affirm the President's pledge to make mass transit our Nation's top transportation priority for the 1970's.

Senator Stafford said he supported the amendment, in part because the revenue it authorized did not come from the Highway Trust Fund. He supported mass transportation but "the highway trust fund is not large enough to meet the extensive needs of all rail systems." He was pleased to join the Administration in supporting the additional $3 billion for capital grants. Although the Administration opposed the $400 million a year for operating subsidies, his view was that "the subsidy provision is vital to the effort to reverse the trend that has seen the death of so many urban transit companies across our Nation in the last 15 years." He added that this bill did not "supplant" the Muskie-Baker or Kennedy-Weicker amendments that would be considered later.

Senators Randolph and Bentsen indicated their support for the Emergency Commuter Relief Act, but Senator Baker said that while he supported the $3 billion in additional UMTA funds, "I find myself not in agreement with providing operating subsidies in the amount of $800 million." Further, he was concerned that "our Committee on Public Works is stretching its jurisdiction to the extent that I believe we are intruding on the jurisdiction of another standing committee of the Senate in the authorization of funds to be appropriated other than from the trust fund for these purposes." When the discussion of the amendment ended, he would introduce a motion to table (not consider) the amendment.

Senator Williams, who knew the motion was coming, stated "my strong position in opposition." The Committee on Banking, Housing and Urban Affairs had jurisdiction over transit. Since a housing bill to attach the amendment to was unlikely, the committee concluded that "it would be proper for me to bring this measure to the Senate as an amendment to the highway bill which also deals in part with mass transit, insofar as bus systems are concerned."

Senator Weicker stated that he would vote against tabling the amendment. I do think it far better at this point of the entire debate to offensively anticipate what is going to take place here rather than be on the defensive":

> There are two situations involved here: No. 1, the direct funding of mass transit in this Nation; and, on the other hand, the situation as it relates to the Highway Trust Fund whereby those moneys will be available for all forms of transportation—rail, highway, bus, etcetera.
>
> So I want to make the situation quite clear that, in supporting the very fine amendment offered by the distinguished Senator from New Jersey, it will also be my intention to attack another problem or another aspect of the problem, which would specifically relate to uses of Highway Trust Fund moneys, because we are so far behind in the task of providing mass transit that the effort that will be required will be on both grounds, the use of money from both the Highway Trust Fund and those that are directly related to mass urban transportation. We will not have done our job in behalf of mass transit merely by passage of this particular amendment.

Senator Biden recalled Secretary Brinegar's testimony opposing subsidies but acknowledging that they could not be met from the farebox:

> I think it is unreasonable to expect all mass transit systems to be on a pay-as-you-go basis. Like the police and fire departments, mass transit systems provide a service essential to the vitality of our communities and like those departments such systems should be subsidized, if necessary. Unlike the police and fire departments, however, which are highly localized and serve a resident constituency, the mass transit systems often cross the jurisdictional lines of local governments and transport people from one constituency to another—and they should be encouraged to do so . . . . Because of the jurisdictional conflicts, such transit systems

> may require Federal initiatives for their construction and quite reasonable Federal subsidies for their operation.

As for concerns about abuse of the subsidy, Senator Biden pointed out that the Federal funds would require a grant from the State or local public body in the ratio of 2 to 1. "This local commitment would provide an incentive for limiting the size of the operating subsidies and thereby encourage efficiency." He contrasted that incentive with General Revenue Sharing, which he said did not have "the checks and safeguards available under the present legislation, and I think that would be throwing the money away."

Senator Domenici recalled the decision to change the name of the subcommittee from "Roads" to "Transportation." He said:

> It was expressed then by our chairman that the reason was that this committee should be involved in the whole matter of public transportation, so that it would not be a matter of merely roads, but also a matter of the financing program for transportation.

He noted, however, that the amendment, and specifically the operating subsidy provision, had never been considered by the Committee on Public Works. Therefore, he agreed with Senator Baker's proposal to table the amendment:

> If the Senate is going to be critical of priorities, then we should not bring to the Senate, without even going before the Transportation Subcommittee of the Public Works Committee of the Senate, a matter that is not included in the bill under discussion by the Senate.

When Senator Baker introduced his motion to table the amendment, it was rejected. Then, by a vote of 59 to 36, the Williams amendment was agreed to. [*Congressional Record-Senate*, March 14, 1973, p. 7896-7902]

The Kennedy-Weicker amendment was the next up for consideration. Senator Kennedy introduced the amendment by saying the Federal-Aid Highway Act of 1973 now before the Senate "contains a series of highly important and valuable reforms in the highway aid program." He cited six reforms. The bill:

- Would make funds previously earmarked only for urban highways available for mass transit systems, including the purchase of buses.
- Would increase Federal-aid urban system funds eightfold to $850 million. "I would note that if enacted, this would be the first time a highway aid bill recognized the high financing share borne by urban residents over the past 16 years."
- Allowed State and local officials to halt an Interstate route and use a portion of the funds for other urban transportation.
- Permits the Secretary of Transportation to allocate $350 million of "urban extension" funds to help areas comply with air quality standards under the 1970 Clean Air Amendment Act.

- Recognized rural mass transit needs by authorizing a small demonstration bus transit program.
- Finally, "the bill recognizes the desirability of enabling large urban areas to plan for themselves and to implement those plans by pass through urban funds to urban areas larger than 400,000."

Even so, "this bill still falls woefully shy of its own objective, the objective of an efficient, balanced, safe and environmentally sane national transportation system." This was because it "rejects the lesson of history by denying to cities and States full flexibility in how they use the great bulk of trust fund moneys, outside the Interstate System." He continued:

> Instead of seeking to remedy the past mistakes in the highway trust fund mechanism which have flawed the worthy objective of creating a national interstate highway system, this bill perpetuates those mistakes. For it says to cities and States, you may not build rail mass transit systems, even though they may be your most urgent need. And it says to rural States, you may not build bus transit systems, with any of your rural fund moneys, even though they may be high on your list of priorities.

The Kennedy-Weicker amendment tells State and local officials that they "are not imprisoned by an archaic concept of national transportation needs that sees highways as the only answer to the Nation's transportation needs."

After describing the provisions of the bill, he said:

> Passage of this amendment would shatter the practice of separate funding for separate modes of transportation. It would end a system in which the national interest has come in second best to special interests which see the highway trust fund as their private property. And it would call a halt to a Federal financing philosophy that has prevented a single city, State, or region from selecting the mix of road, bus, and rail services that it felt best to meet its transportation needs.

He restated many of the points he had made when he and Senator Weicker introduced the amendment. Cities paid 50 percent of the Highway Trust Fund revenue, but less than 10 percent of Federal-aid mileage was in urban areas. Over 50,000 people lose their homes to the highway bulldozer each year, while two-thirds "of urban America is dedicated to repairing, parking, selling, and carrying the auto," despite the fact that, "In cities across our land, the 16-year highway boom has left the worst possible debris—foul air that actually endangers the health of local citizens." He cited the Los Angeles problem:

> The failure to examine the concrete dream has produced federally financed highways that are so heavily laden with air pollution that health officials will not allow us to drive on them. EPA Director William Ruckelshaus' proposal for gasoline rationing to cut auto use in Los Angeles by 80 percent within the next 3 years demonstrates the extreme nature of the problem facing the country.

He cited the air quality improvement and energy savings of a shift of motorists to mass transit.

He referred to the hundreds of failed transit systems and the backlog of $4.4 billion in urban mass transit needs:

> Passage of this amendment would mean that the highway trust fund would no longer be merely a concrete conduit. It would mean that the trust fund would no longer take the form of a club over the heads of State and city decisionmakers with the slogan "use it or lose it." Instead, it would offer a new slogan, "use it the best way possible" to solve local transportation problems.

To those who argued that the Highway Trust Fund could not be used for rail mass transit, he pointed out the way Congress had broadened eligible activities in recent years to include replacement housing, training of highway officials, and archeological salvage. "If all of these various programs can be funded out of the trust fund, then surely bus and rail mass transit can be funded as well." Moreover, many of the taxes had been enacted for general revenue purposes until the Highway Trust Fund was established in 1956. "Legally, there is no question of our power to provide this option, and the GAO and the American Law Division of the Library of Congress, and the General Counsel's Office of the Department of Transportation all have indicated their agreement that Congress has the power to authorize these programs from the trust fund."

The issue, Senator Kennedy emphasized, was not highways versus mass transit "and it never has been." The amendment did not require one dollar to be spent on mass transit. The issue was flexibility:

> Passage of this amendment will place Federal transportation financing on an even keel for the first time and will enable cities and States the flexibility they have been denied in the past to meet local transportation problems. If we seek a balanced transportation system in this land, then this amendment should be approved . . . . I would hope, Mr. President, that the Senate would realize the importance of providing flexibility in this bill to permit those who come from States which are urbanized, as well as those which are rural, to decide for themselves how to develop their own transportation system. Because I believe their concern is how to move people and I do not believe they want to be required to lay down more concrete. [*Congressional Record-Senate*, March 14, 1973, p. 7903-7905]

Senator Weicker recalled that the Cooper-Muskie amendment that passed the Senate in 1972 "came to grief in the House." What this meant, "quite simply, is that the Congress will today shape one of the most important transportation policies of our time." As with Senator Kennedy, he restated many of the arguments he had used when they had introduced the amendment. He concluded:

> Highways alone are a mobility, environmental, and safety disaster—and we have now become a nation of automotive lemmings. There is no longer any reason for a Senator to advocate a particular form of transportation—transportation is not a question of States' rights. Mobility is a national concept.

Citing the example he had used of the wreck on the highway blocking traffic from State to State, he said, “Let us clear this highway trust fund off the highway and get America moving again.” [*Congressional Record-Senate*, March 14, 1973, p. 7905-7906]

Senator Biden spoke in support of the Kennedy-Weicker amendment:

> Having only recently been an elected local county officials, there are several misconceptions which I would like to attempt to clarify regarding the whole question of mass transportation. First, is the misconception that the automobile has been the friend of the suburbs. One of the most important tasks of any local official is to plan the growth and development of his community. Such planning requires controls over concentrations of development or lack of concentration.
>
> Unfortunately, the car, because of its mobility, permits people to spread at will and virtually forces the roads to follow it as the congestion develops. This fact makes coherent development practices more difficult. The automobile, unlike mass transit, removes investment decisions from local officials and gives them to each individual, so that the local government cannot use transportation to control growth in the same way that it can use sewer or water extensions where it controls the investment. The resultant sprawl has virtually eliminated the sense of community that so many Americans used to have and which I believe they still want.
>
> Without overdramatizing, it seems to me that many of our suburban problems, such as increased crime, greater drug use, and the dissatisfaction of our youth, can be traced in some measure to the kind of community or, really, lack of community that we have built.

Mass transit, he said, could “guide the development of these communities by focusing transportation services in certain areas while diminishing the ability to just settle anywhere.”

Senator Biden also disputed what he called the second misconception, namely, “that fixed rail transportation is not feasible for some of our smaller urban areas.” A fixed rail system could help the small town of today plan as it becomes tomorrow’s large urban area. “The development of mass transit facilities in currently rural areas may be the backbone of orderly development in the future.”

Without the ability to use Highway Trust Fund revenue for long-range mass transit planning, “good, solid, local planning cannot take place.” He concluded:

> Transportation can and should be a good social program that will enhance the life of all our citizens. But there are many other arguments for the Federal Government to make the highway trust fund available, at the option of the local government, for mass transit purposes. [*Congressional Record-Senate*, March 14, 1973, p. 7906-7907]

Senator Stafford was the first to speak in opposition to the Kennedy-Weicker amendment. He was concerned that it would “take us too far afield and into areas where there are few demonstrated needs and fewer demonstrated solutions." He thought that the Muskie-Baker amendment would address urban mass transit problems. As for rural areas such as much of his home State of Vermont, the Federal-Aid Highway Act of 1973 "contains what I believe is the most orderly and most effective way to attack the problems of rural transportation." Everyone wanted to spend Federal dollars wisely, but the pending amendment "carries the potential for spreading these dollars too far and too thin at this time."

Senator Bentsen also found the amendment to be unacceptable, saying it "places before the Senate some new issues not even presented to the committee during its hearings." He commented on the use of rural Federal-aid highway funds, which were now to be opened to rural mass transit. "I believe it is legitimate to ask if there presently exists any ongoing rural transportation program which would give the States or any level of government responsible for spending these funds an idea of the kinds of programs that will produce results." Since he considered the answer to his question to be "no," the rural transportation demonstration program in S. 502 would help determine what works.

He also was concerned that the amendment would open one-half of the funds credited to the Highway Trust Fund for possible use for mass transit:

> I would remind my colleagues that we still have considerable highway needs for upgrading and construction in this country, particularly in the rural areas. To dilute the funds by this much, as this amendment suggests, would be very unwise.

In view of the government's need for fiscal restraint, the Public Works Committee had held down expenditures in the bill. "But it is quite another thing to take this reduced authorization and then to open it up as broadly as this amendment suggests to the funding of mass transit." To do so would "cripple a highway program that we have already cut back."

Senator Kennedy responded by reiterating his point that about 50 percent of Highway Trust Fund revenue came from urban areas, while less than one-third of non-Interstate funds were spent there. "At least let us spend it for mass transit, buses and highways if we want."

Senator Weicker said the Kennedy-Weicker amendment raised the same issue as the Cooper-Muskie amendment in 1972 and the Muskie-Baker amendment in 1973. "The issue is clear. Is there to be a matter of choice or are the State and local officials going to be told how their money is to be spent?" He said all the Nation's "energy, thoughts, and money" had been directed solely to highways. Now the time had come to find other modes that "will unsnarl us from the traffic jams."

He continued:

> Consider the arrogance of this lobby called the Highway Trust Fund Lobby. Who are they? They are the ones who sell the ingredients for a highway system. Our job is not to sell anything but mobility on the floor of the Senate. That is our job. They have the arrogance to suggest that when we pay our gasoline taxes we expect them to use it for highways. I dare say that there is not one person in 10 who knows what the gasoline tax is going to be

> used for. I dare say that there is not one in 10 who wants it to be used for highways only, rather than for other modes of transportation. Americans want to be able to move, and our legislative work here in the U.S. Senate ought to be geared toward that end. [*Congressional Record-Senate*, March 14, 1973, p. 7907-7909]

Senator Mike Gravel (D-Ak.) was concerned that "we have this desire to crash down the trust fund" to satisfy mass transit needs:

> So the committee tried to respond to the needs of this country rather than adopt a policy which would result in crashing down and distorting and destroying a program that has served this Nation well . . . . In fact, the trust fund has worked so well that certain people want to invade the trust fund for other uses.

This attempt to "piggyback the program" would be "an unfortunate development as a policy of this country."

Senator Tower, responding to Senator Weicker's comments about the highway lobby, asked, "I wonder if it could not be charged that there is a lobby behind this mass transit movement from the people who sell rolling stock on railroads, who sell the rails or the ties, or what have you." The highway user tax is "probably one of the fairest taxes in this country, because the proceeds from that tax go to benefit those who pay the tax." The Kennedy-Weicker amendment would be "totally inequitable." In fact, it was "immoral."

He regretted the vote to incorporate the Emergency Commuter Relief Act:

> We have just provided an operating subsidy for mass transit, and we will regret the day we did it, because we are encouraging poor management and inefficiency, and discouraging applying the cost of mass transit or passing it on to the people who use mass transit. Why cannot the people who use mass transit pay for it, instead of making the people who use the highways pay for mass transit?

Senator Kennedy again stated that 95 percent of the tax revenue going into the Highway Trust Fund had previously been part of the general Treasury:

> Yet, "we are robbing Peter to pay Paul" the opponents say. Just because the highway trust fund has been able to earmark their own boondoggle . . . does not give them a right to say that they have a right in perpetuity to use those funds for building highways. Congress authorized the program and Congress can change that authorization.

He emphasized that he and Senator Weicker were "merely trying to give the kind of discretion to those in the States, the governors and the mayors, so that they might be able to enter into the development of transportation systems." whether in rural or urban areas,

As the debate wound down, Senator Weicker wanted to respond to Senator Tower's point about the existence of a mass transit lobby:

> The highway trust lobby is a very well defined group. On our side, it is the people's lobby. It is not anyone who wants to sell railroad cars or buses. It is a people's lobby and they have had it.

He also disagreed with Senator Gravel that the purpose of the Highway Trust Fund was to build highways:

> I would point out that this is not the objective. The objective is to have transportation systems to move people.

He said that he and Senator Kennedy thought the time had come to learn from experience, "which has been a bad one."

Senator Tower replied that much of the marketplace moves by highway, not on mass transit systems. That is why the Interstate System should be the concern. "The fact of the matter is that the urban mass transit benefits only those who live in those localities." Further, "these systems cannot now maintain themselves based on their current methods of operations and their current revenues." By approving Senator Williams' amendment, the Senate had voted that everyone in the United States would subsidize the urban mass transit systems in the Northeast corridor. "However, a case cannot be made that urban mass transit systems—and particularly those in communities—are a greater national asset than the Interstate Highway System which moves not only people but almost everything else of importance in this country." [*Congressional Record-Senate*, March 14, 1973, p. 7909-7910]

Senator Randolph took up much of the remaining time before the Senate voted on the Kennedy-Weicker amendment. He began by addressing the issue of lobbying:

> Mr. President, there was not a vote, last year, of 60 against this amendment and 18 for it because Senators were voting as a part of a lobby, either for a rapid rail transit lobby or a highway lobby. The Members of the Senate were thinking these problems through and expressing themselves, just as they will today.

He pointed out that despite Senator Kennedy's and Senator Weicker's antihighway comments, Massachusetts had 256 highway projects underway and Connecticut had 228 highway projects under construction:

> What I am saying is that rapid rail transit would be an adjunct, moving people into a city, either Hartford or Boston. Remember, my fellow Senators, that the persons who work in the buildings, the persons who provide the services in the complex of structures throughout a great metropolitan area, will never receive those items on which they work and which they use by rail transit. Those items will be brought to the front door, to the alleyway, or to the back door, and if there are those who ride by rail into the city, remember that the products and the items used in servicing the people of a great city will move by road, by highway. It cannot be any other way.

If, as the two Senators and their cosponsors proposed, the mode of travel were reversed, the cost would be "astronomical" for the movement of people and products.

Improved rail transportation could not be accomplished via the State's highway allotment:

> For example, how much in primary and secondary funds could Rhode Island use? . . . [It would receive] $4 million. How much can Connecticut use? $6.5 million. How much can Massachusetts use? $9 million.
>
> What would this buy in the way of rail service, and still meet the highway needs of the States I have mentioned?

Senator Kennedy interrupted to ask "why not let the people of Massachusetts decide how they are going to expend that $6 million" [sic]?

> Mr. Randolph. Is the Senator saying that there is not a need in this country for a highway trust fund? Is he saying there is not a need in this country for an airports and airways trust fund? Why does not the Senator from Massachusetts advocate an urban mass transit trust fund?
> Mr. Kennedy. If the Senator will yield further, he asked me that question before his committee, and I indicated that I think there ought to be a single national transportation trust fund with this kind of flexibility, so that we could develop balanced transportation for communities, for States, for regions, and for the country. So we have answered that particular question.
> Mr. Randolph. No, the question has not been answered, because earlier today I indicated that the trust fund will die in 1977, and then is the time to evaluate its future.
> Mr. Kennedy. The Senator indicated that Massachusetts would get $6 million. All our amendment would do would be to permit the people of Massachusetts to decide how that money would be spent rather than depend on an arbitrary restriction devised in 1956—for conditions then.
> Mr. Randolph. Well, remember, the Senator has referred to the people. The people in those States, we know, pay user taxes. They have had highway programs, and those moneys come from bond issues on which they vote directly. Today if we adopt this amendment or another amendment, we begin to put a stop to a program which is not completed but must be completed. I wish the Senator could realize that fact . . . .
> Mr. Kennedy. Mr. President, as far as completion of the Interstate System is concerned, there is no change. Our amendment does nothing that would threaten the completion of the Interstate System. Second, if these States had gone ahead and had various bond issues or made long-term commitments or had obligations, then the States themselves can make that determination, and decide, as far as they are concerned, that they are going ahead and build more highways. But if other States have a different view and if Massachusetts does not desire to make highways its number one priority, then, I still ask the Senator why he wants to mandate a formula that would require us to do so.

He asked unanimous consent to include supportive material in the record, including a March 13 telegram from Kramer of the Highway Action Coalition wholeheartedly endorsing the Kennedy-Weicker amendment on behalf of 19 national environmental, consumer, civil rights, and trade union organizations:

> We believe that granting cities and States the option of selecting whatever nix [sic] of ground transportation modes that will best meet their particular needs is an essential and vital step.

Other items included letters from Dr. Ronan of the Institute for Rapid Transit, Stanley H. Gates, Jr., of the American Transit Association, and Stephen Bossi of the National Catholic Rural Life Conference.

Senator Randolph had the final word as time to debate the amendment expired. He pointed out that, "The funds are distributed, of course, on the basis of highway needs. There is no formula by which we make distribution based on rail needs. One is clearly defined. The other does not exist."

The Senate rejected the Kennedy-Weicker amendment by a vote of 23 in support, 70 against. The amendment had gained some support since securing only 18 votes in favor in 1972, but still was not close to adoption. [*Congressional Record-Senate*, March 14, 1973, p. 7910-7913]

Next, the Senate considered the Muskie-Baker amendment opening Federal-aid urban system funds for rapid rail systems. Senator Muskie emphasized that this amendment was "a sensible proposal" that would affect only Federal-aid urban funding. It would not affect rural areas. It would not force cities to substitute mass transit facilities for highways, but would merely make that option available for the first time. "The amendment would not divert trust funds from highways that ought to be built; it would allow cities to substitute alternatives for highways that should not be built.

He also pointed out that the amendment was not supported by only narrow interest groups. It was supported by the Nixon Administration and a broad coalition that included the Nation's Governors, the National League of Cities/U.S. Conference of Mayors, the United Auto Workers, and Common Cause. "It has become clear to these and many other Americans that our current national transportation policies are badly out of step with our needs." In addition to the problems of congestion, "highways and the cars that use them pollute the air of our cities and menace the health of the people who live there." In passing the Clean Air Amendments of 1970, the Senate resolved to protect public health:

> We explicitly excluded considerations of economic and technological feasibility in setting ambient air quality standards under the act. And for the same reasons we set a statutory deadline for the development of a clean car.

He cited the Public Works Committee's report on the Clean Air Amendments of 1970:

> As much as seventy-five percent of the traffic may have to be restricted in certain large metropolitan areas if health standards are to be achieved within the time required by this bill . . . .
>
> Construction of urban highways and freeways may be required to take second place to rapid and mass transit and other public transportation systems. Central city use of motor vehicles may have to be restricted.

Senator Muskie said that a switch from auto to rail would vastly improve air quality:

> On one hand, Mr. President, we have told the cities they must make changes to their transportation systems to protect the public health. But on the other hand we have withheld the funding flexibility that would make those changes possible. This is not consistent policy on our part, and it is a disservice to the cities and to the national policies we ourselves established. By finally granting that long-sought flexibility, this amendment would make it possible for the cities to fulfill both their responsibilities . . . .

He was concerned, too, about the destructive impact of highways and automobiles on cities. “The heedless construction of urban freeways has run roughshod over the real transportation needs of city residents, displacing literally hundreds of thousands of people and businesses in the process.” He continued:

> On one hand, Mr. President, we have expressed our concern over the fate of our cities as places where people can live and work, and we have created programs and spent money to restore the urban environment. But, on the other hand, we have forced those same cities to build highways which defeat that objective.

The Muskie-Baker amendment would “restore good faith and good sense to our efforts to save our cities.”

Then there was the waste of fuel at a time when the country was facing “an energy crisis from which there may be no road back.” He pointed out that the Highway Action Coalition predicted that cutting automobile use in urban areas by merely 25 percent would save 1 million barrels of petroleum a day. He said that “our present extravagance is unacceptable,” continuing, again using the one-hand/other hand image:

> On one hand, Mr. President, we have rung the alarm concerning the energy crisis, and we are seeking ways to reduce our fuels’ consumption and to increase our reserves. But on the other hand, our policies have the effect of pressing upon our cities the most wasteful and inefficient form of transportation that exists.

The Muskie-Baker amendment would “bring our transportation policies in line with our energy concerns.

The amendment also would address the problems of households that did not own a car. Many Americans pay “a price for urban highways that we cannot afford” while getting “nothing in return." For these citizens, in short, "the highway trust fund and the transportation systems it creates rob Peter to pay Paul." The Muskie-Baker amendment would "correct these inequities" by making the Highway Trust Fund "more sensible, to bring it up to date, and to revitalize it as a useful funding mechanism to meet our transportation needs."

Senator Muskie reminded his colleagues that the funds now credited to the Highway Trust Fund once were credited to the general Treasury. "The question now before us is whether—the original purpose being nearly completed—those General Treasury revenues presently in the trust fund should be applied to a broader purpose." He pointed out that Congress had never "made that trust fund irrevocable, nor has the Congress ever waived the right to modify its purposes." In fact, the purpose had been modified, for example by extending Highway Trust Fund revenues to billboard removal and relocation of junkyards. "And this year, S. 502 would authorize trust funds for the relocation of railroad lines . . ." in Lincoln and Brownsville. "The argument that the trust fund is sacrosanct falls in light of these precedents."

One option was to build only more roads, "regardless of whether they are wanted or needed." A second option would be to return some of the funds to the general Treasury to create a public transit trust fund. The problem with this option was that competition for general Treasury revenue was fierce, and instead of giving State and local officials flexibility, it would restrict them to using the funds for public transportation.

Therefore, the best option was to amend the Highway Trust Fund to allow some of its dedicated funds, that were not subject to the competitive forces of general Treasury revenue, to be used in a flexible way for the transportation mix State and local officials think best.

In summary, Senator Muskie said that in 1956, when the priority was to build the Interstate System, but the Senate was faced now with "another transportation problem that is national in scope." In approving the Muskie-Baker amendment to address this new problem, he said that no trust will be violated, no money wasted, and no transportation project built "that does not make sense from the point of view of the people who must live with it." The amendment would not "provide automatically the ingenious new transportation systems we need for our cities, nor quick public acceptance of mass transportation as a substitute for the luxury and convenience of the private automobile." However, it represented a "starting point, both to signify our willingness to change and to make it financially possible to do so." [*Congressional Record-Senate*, March 14, 1973, p. 7914-7916]

Senator Muskie then engaged in a brief colloquy, probably arranged, with Senator Frank F. Church (D-Id.) in which Senator Church asked about the impact of the amendment on a rural State such as his own Idaho. Would the amendment diminish funding for Idaho? "Not in any way." Idaho would not lose a penny? "The Senator is absolutely correct." The principle is that people at the local level should decide for themselves how best to address their transportation problems? "The Senator has cited it with precision." [*Congressional Record-Senate*, March 14, 1973, p. 7937]

Senator Baker took a few minutes to explain why he believed the Muskie-Baker amendment "completes what we set out to accomplish in S. 502; that is, to allow urban areas the freedom they need to plan effectively for transportation" without diverting resources from rural areas that have different needs. Some might ask about the provisions in S. 502 that open Highway Trust Funds for buses, "Isn't this far enough?" That question misses the point, Senator Baker said, which is "to remove artificial barriers to rational transportation planning."

He was convinced that the majority of urban areas would continue to spend most, if not all, of their Federal-aid highway funds on highways and highway-related projects. If the amendment is adopted, those cities will be able to spend their funding for roads because they decide that "roads are the best answer to their problems and not because the only funds available must be used to construct highways."

He did not dispute the historical justification for past policies or "the tremendous impact of the Federal-State highway partnership in developing the Nation," but today, especially in urban areas, "highways are no longer the single answer to transportation needs."

He believed that public transportation systems could, some day, be profitable. He planned to introduce an amendment that would direct the Secretary of Transportation to report to Congress within a year "on means by which those mass transit systems which benefit from highway trust funds can contribute to the trust fund." If such a means can be found, it would help maintain "the integrity of the trust fund as a user fund."

Finally, he emphasized that neither he nor any of the other cosponsors of the Muskie-Baker amendment intended the Highway Trust Fund to be "the major source for massive investment in urban mass transit." Continued investment through UMTA was essential. "The significance of the amendment lies less in the amount of urban system highway funds finally expended on rail projects than on the provision's recognition of the need to encourage truly comprehensive transportation planning and rational consideration of a range of alternatives to the use of private automobiles in congested urban areas." [*Congressional Record-Senate*, March 14, 1973, p. 7938-]

When Senator Bentsen took the floor, he recalled that S. 502 increased Federal-aid urban system funds ($100 million to $850 million), which he said was "a recognition by this committee that the transportation problems of our urbanized areas have become increasingly severe in recent years, and that the Federal Government has a responsibility to meet them." For cities with a population over 400,000, S. 502 provided a pass-through of Federal-aid urban system funds "because we believed that incorporated municipalities of that size were in a better position to judge their local needs" and "have considered some State highway departments insensitive to their local needs." Local officials could use the urban system funds for highway-oriented mass transit or traditional highway projects.

Why not, he asked rhetorically, allow the use of Highway Trust Fund revenues for rail mass transit? He understood the great need for all forms of mass transit, including rail. For that reason, he supported the Emergency Commuter Relief Act that added $3 billion to UMTA funding for capital grants and $800,000 for operating subsidies. Further, he rejected the idea that if you were pro-highway or pro-transit, you had to be anti- the other option. "If you are pro mass transit, as I am, it does not necessarily follow that you are anti highway or that you believe that the Highway Trust Fund is necessarily the proper vehicle for directing funds into mass transit."

His argument, he said, was practical, not philosophical. If the Muskie-Baker amendment passed, each State would receive a relatively small amount of Federal-aid urban system funding that could be used to address large amounts of needs. He pointed out that the District of Columbia, which was building its Metro system at an estimated cost of $2.9 billion, would receive $5 million. San Francisco was building the BART at an estimated cost of $1.45 billion, but the State of California would receive only $98 million in urban system funds that, under the Muskie-Baker amendment, could be used for mass transit. Georgia, with its $1.3 billion subway system under development in Atlanta, would receive $14 million for its urban areas, some of which would not go to Atlanta. New York's share would be $84.4 million:

> With needs that vast, it is obvious to me that a move now to open the Highway Trust Fund to rail mass transit would be interpreted as little more than a symbolic gesture, which would tend to offer only token support to both highways and mass transit. In other words, we could very well harm the highway program without offering more than very minimal support for mass transit.

Senator Bentsen said he was ready to study "any alternative which would provide realistic funding for these purposes." He planned to look into the issue as a member of the Senate Finance Committee. Senators Muskie and Baker knew that he was sympathetic to their general goals. "At this time, however, I believe that the Highway Trust Fund is neither an adequate or realistic vehicle to achieve their objectives."

Senator Weicker responded to Senator Bentsen by asking Senator Muskie a question. "Is there any directive in the language of this amendment . . . that directs that any portion of the money be used for mass transit?" Senator Muskie replied, "Not at all." Therefore, Senator Weicker stated, the issue was not one of highways versus mass transit but rather highways versus a balance in transportation policies. He fully supported the Muskie-Baker amendment, which he thought would "set a new direction for transportation policies in this country." He added:

> Then the only persons that I feel sorry for are those in the House of Representatives who will have to be subjected to the last-ditch effort of those who feel that the answer to the problem is more highways. And, to that extent, they will be pressured by the lobbys [sic].

Senator James A. McClure (R-Id.), who was serving in the House of Representatives when he won election to the Senate in November 1972, agreed with the point that transit needs far exceeded the resources of the Highway Trust Fund. He quoted Robert Coultas of the Institute for Rapid Transit who said:

> We believe that the highway system should be built and completed, and we believe that there has to be much more Federal support of urban transit systems. Now there is not enough money in the Highway Trust Fund for both.

Senator McClure stated that the end result of adopting the Muskie-Baker amendment would be "to deprive us of a safe, efficient road system, to meet our future needs, while simultaneously failing to meet the mass transit needs of the urban areas." In fairness, he contended that the "basic beneficiaries of future transit systems should pay the costs of building and operating those systems."

Senator Domenici also cited the high cost of transit systems, pointing out the section of the Public Works Committee's report that stated:

> Costs of rail systems are so high that the highway trust fund would not be able to bear any substantial share without seriously impairing its ability to meet the highway needs of the Nation.

Some people, he recognized, preferred to "do something, even something marginally effective" rather than "do nothing." Of course, S. 502 did something by allowing the use of Highway Trust Fund revenue for highway-oriented mass transit. "These changes were made because the committee felt that buses can be made available quickly to utilize existing urban highways, whereas rail transit, in addition to being costly, has a long development time." To allocate funds that are insufficient to have a "significant beneficial impact from the highway trust fund simply because it is a convenient source, will have the unintended and undesirable effect of delaying the development of a comprehensive resolution to the dilemma of urban transportation . . . ."

Senator Domenici said that human nature being what it is, he anticipated that approving the Muskie-Baker amendment would encourage people to think "these initial modest diversions from the highway trust fund" could accomplish "more than is possible." The unfortunate result would be a loss of momentum in finding a real solution to the funding problem.

He concluded with a defense of highway transportation. Without roads and motor vehicles, people would be living in "skyscrapers and cubicles," unable to see the out-of-doors because they could not get around:

> I do not think it is fair to attack the automobile and the highways of America because this country has not seen fit to take care of another and completely different problem, the problem of the central city and the need for a transit system. [*Congressional Record-Senate*, March 14, 1973, p. 7938-7942]

Senator Buckley of New York was fully supportive of the amendment, as he had been in 1972. "We have heard official after official complain of the compartmentalized thinking which has resulted too often from certain programs." The highway program was an example because it prompted State and local officials to think in terms of highways rather than transportation solutions. "We have reached a point of diminished returns as we try to conceive of our transportation needs as a whole . . . ." He continued:

> I believe that what is contained in the Muskie-Baker amendment will serve, if nothing else, to psychologically liberate our planners, to liberate their thinking so that they can see the pool of resources available and determine in the most intelligent manner possible how best to deploy those funds towards the completion of a system which has as its objective not rail, not highway, not one form of transportation nor the other, but the most effective way of

> allowing individuals to move where they need to move and allowing goods to be shipped where they need to be shipped.

As for "the so-called sanctity of the trust fund," he used the oft-stated point that 50 percent of the revenue comes from urban residents who "favor the kind of flexibility which we speak of, and . . . recognize their own convenience as motorists is best served by relieving the congestion that too often frustrates them." He concluded:

> I do not believe that we should allow a fixation on this narrow issue of "sanctity" of the fund to preclude us from advancing in the direction which this country so vitally needs. [*Congressional Record-Senate*, March 14, 1973, p. 7942]

Senator Percy agreed that S. 502 was a step forward in opening the Highway Trust Fund to highway-oriented mass transit. "Unfortunately, however, the committee bill forbids cities like Chicago from using their allotment for rapid rail improvement." He discussed Chicago's experience:

> The city of Chicago now has a public transportation system with both rail and bus elements. The rapid rail routes complement and supplement service provided by buses. Both elements are in serious disrepair, and yet the committee bill would prevent Chicago from improving its rail service.

He introduced into the record an article he had written for the *Chicago Sun-Times*, March 11, 1973, that began, "Chicago today faces the unhappy prospect of losing a public transportation system it desperately needs, and of possibly gaining a superfluous superhighway." (He was referring to the controversial Crosstown Expressway, designated I-494.) While Federal-aid matching ratios favored highways, congestion was growing. Meanwhile, the CTA was threatening a fare increase (to 50 cents from 45 cents) and a cutback in service unless the State provided immediate relief. "Without this aid," the article said, "the CTA cannot pay its employes [sic], buy supplies or meet other day-to-day operating expenses."

Senator Percy's article traced the problem to 1956 when President Eisenhower was in office and Mayor Daley was serving the first year of his first term. In that year, the Nation embarked on construction of the Interstate System and established the Highway Trust Fund to finance it. "Compared with the Highway Trust Fund, the machinery designed to provide funding for mass transit resembles an anemic step-brother." Aid began, he said, only 3 years earlier under the Urban Mass Transportation Act. "Unlike highways, whose financing comes from a sacrosanct trust fund that can be used only for highways, mass transit gets its money from general revenue" and must compete with other priorities.

The article concluded:

> We have seen enough of bulldozers razing homes and paving over parklands to make room for more roads which quickly become so congested no one can move.

> Neighborhoods threatened by the proposed Crosstown Expressway must be preserved, as must the CTA.
>
> It is hard to overstate the mindless callousness of a system which permits a four- six- or even eight-lane superhighway [sic] to rip through the heart of a city, tearing up entire neighborhoods and wiping out public parks and irreplaceable historical sites, all so that thousands of additional cars can crawl along at the grand speed of 15 m.p.h., causing intolerable pollution and consuming more of our increasingly limited supply of gas and oil resources. [*Congressional Record-Senate*, March 14, 1973, p. 7942-7944]

Senator Muskie responded to some of the amendment's opponents. The Muskie-Baker amendment gave officials the option of using rail transit to solve their transportation problems, but does not change in any way the highway option for States that wish to go that route. He pointed out, again, that 98 percent of the revenue credited to the Highway Trust Fund once went into the general Treasury:

> Congress decided to divert those funds from the General Treasury into the highway trust fund for the specific purpose of building the Interstate Highway System. It is now time to consider whether to make those funds available in part to serve another national transportation need, having to do with the need for mass transportation in our cities.

As for Senator Bentsen and others who opposed the amendment because it involved relatively small amounts of funding, Senator Muskie said:

> I make two points in response. First, the highway trust fund when this bill is enacted will have undertaken to finance $87 billion of highway construction in this country since 1956. Resources of this magnitude surely, if applied to our needs in the next 21 years, are sufficient to build us a balanced transportation system.
>
> I am not proposing that at this point we divert these funds entirely to mass transit. We are not ready for it . . . . The Muskie amendment is a first step, a beginning step, not a total step in giving the people of our cities a choice as to the transportation system that makes the most sense to them, the people that delivered it.

Really, he added, those who thought the Muskie-Baker amendment was too small should have voted for the Kennedy-Weicker amendment. [*Congressional Record-Senate*, March 14, 1973, p. 7946]

Senator Randolph said the issue was not diverting funds but whether enough funds were available to meet highway needs. He fully supported mass transit and would support an urban Mass Transit Trust Fund. He asked Senator Long, chairman of the Finance Committee, how he would feel about setting up such a trust fund. Senator Long said that if the Senate wanted to earmark funds, even highway user tax revenue, for that purpose, "I personally would be happy to vote for such a proposal." Congress could earmark any tax because "there is nothing sacred about any particular source of revenue." He suggested consulting Administration officials about their support for such a trust fund and the sources of revenue.

After thanking Senator Long, Senator Randolph explained that he did not oppose the Muskie-Baker amendment because he opposed its objectives. To the contrary, he supported urban mass transit:

> My argument with the proposed amendment . . . is based on the fact that it will not accomplish their objective, if their objective is to improve our ability to respond to demonstrated need . . . . The proposal is a charade. It is not being offered as an effort to meet urban transit needs, but as a means to "bust the trust," it is without genuine purpose, for it is ill-timed and arises in the wrong context.

The funds involved, he pointed out, did not come close to meeting needs as documented in the Department of Transportation's 1972 needs report. If all the Federal-aid urban funds were used for rail mass transit, it would still not be "a serious gesture." It was, instead, "the offering of a false promise."

The areas that required substantial transportation control measures to meet air quality standards by mid-1977 will not be able to build rail transit systems by then. That was why EPA Administrator Ruckelshaus told the Subcommittee on Transportation that bus service was the best option within the timeframe.

He disagreed with the concept that "we are letting the dead hand of the past control our ability to respond to the problems of the present." The Highway Trust Fund had been created in 1956, but Congress had reviewed and extended it in 1961 and again in 1970. "The issue of the use of the fund has thus been before the Senate twice since the highway trust fund was established" and would be again in the 94th Congress. "The issue of extending the fund, modifying it, or letting it pass from existence will be squarely met then." Creation of a Mass Transit Trust Fund also could be considered in the next Congress.

After other Senators expressed their views, the Senate voted to approve the Muskie-Baker amendment, 49 to 44. [*Congressional Record-Senate*, March 14, 1973, p. 7946-7950]

The final vote of the day was on an amendment offered by Senator Henry L. Bellmon (R-Ok.) to prohibit impoundment of authorized Federal-aid highway funds unless necessary to "defray expenditures which will be required to be made from" the Highway Trust Fund. Before Senator Bellmon commented on the amendment, the Majority Leader, Senator Mansfield apologized for bringing the measure to the floor after having promised that the Muskie-Baker amendment would be the final vote of the day. "However, circumstances make it almost mandatory—if I may use the word advisedly—to consider this amendment at this time." Debate would be limited.

Senator Bellmon explained the purpose of his amendment:

> My information is that at the present time there are $2.5 billion of highway trust funds impounded, and this measure would have the effect of releasing those funds and starting the

> orderly flow of this fund back to the States, so the States could build the system in an orderly fashion.

Impoundment of Federal-aid highway funds, he said, began in FY 1967. Since then, "this executive intrusion has had a devastating impact." It affected construction schedules, completion of the Interstate System, and construction industry jobs. He did not believe the Constitution allowed such a practice:

> The Congress has gone on record on several different occasions to express the sense of this body that this practice be stopped. Up to now the executive branch has ignored the will of the Senate and continues to impound the funds.

He cited Missouri's lawsuit and Judge Becker's ruling. The U.S. Court of Appeals had heard the case on January 10, 1973, and a ruling was pending. To those who argued Congress should await the ruling, he pointed out that the ruling could involve "many possible variables," and would likely be appealed to the Supreme Court. That could take many more months. "Let the Senate act now to finally set the record straight, upon the enactment of this new highway program."

Senator Bentsen explained that he had to reluctantly oppose the amendment. He was deeply concerned about impoundment, but with the courts considering the matter, "I think any action which we take today would cloud the clarity of our legal position in opposition to impounding." His concern was that the court could find that "Congress was so unsure of the President's lack of authority to impound in the past that it has for the future removed any question . . . ." Alternatively, if the Senate rejected the Bellmon amendment, "it could be argued that . . . the Senate was upholding the President's authority to impound." He asked that the amendment be withdrawn. Senator Baker said he was reluctant to vote for the amendment, but would do so. He pointed out that one of the first colloquies he had engaged in after coming to the Senate in 1967 was in opposition to President Johnson's impoundment of Highway Trust Fund authorizations. He was concerned that a vote against the amendment would appear to be, as Senator Bentsen had said, support for the President's authority to impound. "I want to keep intact the cash-and-carry nature of the highway trust fund" so reluctantly, he would vote for the amendment.

Senator Bentsen requested a vote on tabling the amendment (neither approving nor disapproving it), but the vote was 29 to 59 against doing so. The Senate then voted, 64 to 21, to approve the Bellmon amendment as part of S. 502. [*Congressional Record-Senate*, March 14, 1973, p. 7950-7953]

On March 15, *The New York Times* reported that the Administration had "lobbied hard" for the Muskie-Baker amendment, but had "vigorously opposed" Senator Williams' amendment, primarily because of its funding for operating subsidies, and Senator Bellmon's amendment. In addition:

> The bill has been the subject of intense lobbying over the last week. Even this morning [March 14], representatives of road builders and truckers were visiting Senate offices to argue against the Muskie-Baker plan.

> And lobbyists from the White House, including John D. Ehrlichman, President Nixon's chief advisor on domestic matters, were also in touch with Senators, working for the transit proposal.

Senator Weicker said approval of the Muskie-Baker amendment was "a shattering victory over the highway lobby, which has for years held the Highway Trust Fund in a grip of concrete." Senator Randolph objected to the reference to lobbies. "The equities are with those of us who oppose the amendment." [Rosenhaum, David E., "Senate Approves the Use of Road Funds for Transit," *The New York Times*, March 15, 1973]

A spokesman for HUFSAM said, "We're heartened by the closeness of the vote on the Muskie amendment. It will give us a better chance in conference this time around." Despite Representative Kluczynski's change of heart, the House Committee on Public Works was not expected to include a version of the Muskie-Baker amendment in its bill. However, transit advocates were not worried. John Kramer predicted, "We're going to win on the floor," citing a more "urban-oriented" House membership than in 1972. He predicted that "the floor vote is going to be very close."

An additional concern was the threat of a presidential veto. Inclusion of funding for operating subsidies and the prohibition on impoundment raised the concern. ["Senate Again Votes for Highway Trust Fund Diversion," *Engineering News-Record*, March 22, 1973, p. 54]

The Senate Finishes Its Bill

On March 15, the Senate took up numerous amendments, some of which involved State interests. Senator Byrd began by introducing an amendment cosponsored with Senator Randolph to add Wheeling, West Virginia, to the railroad relocation demonstration project. No one objected to this amendment, but before the Senate voted, Senator Randolph wanted to address a point Senator Muskie had made:

> The Senator from Maine pointed out we are doing something in reference to railroads. I think it is important to have the Record reflect that the relocations are made so that the highways near these railroads can better serve the people. This is the reason for the relocations.
>
> We are not in the business of relocating a railroad; we are attempting to make the highway program more meaningful to the people involved and the community where the relocation takes place.

The Senate approved the amendment. [*Congressional Record-Senate*, March 15, 1973, p. 8182]

Senator Buckley revived the amendment he had introduced in 1972 to delete the provision, now Section 148 of S. 502, allowing Texas to return Federal-aid funds used on the North Expressway and build it as a State project. The future of the North Expressway, he said, was in the courts. After Secretary Volpe had approved the two end segments, the U.S. Court of Appeals had found that the action did not satisfy NEPA or Section 4(f) because he had not considered feasible and prudent alternatives to the middle section that would require the taking of parklands. The Department of Transportation had since issued a report on the middle section, including alternatives, but had not decided on the preferred routing. "Thus the status of this dispute is that construction of the North Expressway is enjoined by order of the court until the State and the Secretary make the required study."

The Senator objected to the provision because it would be "the first step in an unending process of undermining on a case-by-case basis the environmental protection statutes which we now recognize as essential to safeguard the country's environment." Congress would become involved in "an endless round of specific adjudications over whether this highway or that dam or this canal should be exempted," thereby thrusting Congress "into the realm of the courts in the adjudication of sharply contested specific disputes." He introduced a letter from Russell E. Train, chairman of the Council on Environmental Quality, stating that Section 148 "represents an extremely bad precedent and a retreat from the Federal Government's commitment to important national environmental concerns . . . ."

Senator Buckley said, "I do not believe we should take that first step."

Senator Bentsen began by observing that Senator Buckley did not object to the project, but only to the precedent he believed Section 148 would set. "I am sure that is a great comfort to the people of San Antonio who have been trying to build this project since 1959." He explained that Section 148 did not set a precedent. "It simply approves the action already taken by the State of Texas in returning the Federal funds designated for this project and removes any Federal involvement." He continued:

> Senator Buckley speaks of all these interstate projects waiting back here in the hills and in the wings which will be seeking relief. This is not an interstate project. I have not heard any State offering to build a 90 percent federally financed interstate system with local funds. Just name me one. Even if a State wanted to build one, Congress could not wash its hands of such a project. Interstate highways have been designated as part of a national system. What we have in San Antonio is local people wanting to build a local road with local funds. According to testimony received by the Transportation Subcommittee, this is the only instance in which such local action has not been allowed.

He also recalled Senator Buckley's support for the Muskie-Baker amendment, saying "how he wanted local options and local decisions to be made. That is what I am asking for the people of Texas."

Senator Tower pointed out that 6 months ago this week, the Senate had debated this identical question before the amendment was "soundly defeated." The House had approved the amendment, but of course, the bill failed for unrelated reasons.

He wanted to address the two primary objections to Section 148. First, he cited the unique circumstances, already explained, that would prevent the provision from setting a "dangerous precedent." The second objection was that the expressway "would be detrimental to the environment of San Antonio." He said that "it has become apparent that oft times false claims have unfortunately overshadowed the facts." He pointed out that only 9 acres of the park, located at the extreme southwest corner of the Brackenridge golf course, would be affected. "In fact, the golf course has been rebuilt to accommodate the expressway and has been back in play in its realined configuration for some 4 years."

He concluded:

> I would hope that we in this body never reach the point that we feel ourselves so restrained by statute that we refuse to examine the merits of an individual case which reaches us for consideration. The San Antonio north expressway represents just such a case, boasting facts which, when balanced, find the equities in favor of its completion.

Senator Buckley responded that he was for local determination, but "when one seeks Federal money it comes with Federal conditions attached. This is a fact of life." He insisted that section 148 would set "a very large precedent and one which will be cited time and time again." He knew of "over 30 cases, certainly not on all four's with this one, where equivalent arguments could be made for elimination of Federal protection." He noted the provision in S. 502 on I-66 in Virginia, but pointed out that it did not exempt the project from NEPA or other Federal requirements, but only gave the review process priority.

He pointed out that Senator Cotton planned to introduce an amendment later in the day that would waive certain Federal-aid requirements for I-93 through Franconia Notch in New Hampshire:

> No; we will be opening a Pandora's box if we isolate a specific case where matters affecting sensitive areas in a Senator's State are concerned . . . . I do not believe we here should be arguing whether or not this is desirable or not desirable. This is precisely the determination that is to be made by competent transportation authorities on the basis of a comprehensive study.

His chief regret was that few Senators were on the floor to hear the debate so they would understand the essentials of the issue. In fact, Senator Buckley was convinced that his amendment had been defeated in 1972 by nearly 2 to 1 because the Senators had "an insufficient understanding of the importance of this matter."

Senator Domenici said he reluctantly disagreed with Senator Buckley:

> The theme of his argument is that it is wrong to commit a present injustice in the name of avoiding a future misapplication of this section . . . . [It] seems to me there is no question but that to agree with the Senator from New York is to agree that the present injustice of a serious nature must be permitted to stand because we are concerned that we will not be able in the future to distinguish similar injustices that come before us or other tribunals charged with environmental protection for the citizens of this country.

As a member of the Subcommittee on Transportation, he had read the statements of experts from San Antonio indicating that "no harm would come, and they would like to complete it for themselves."

The Buckley amendment was "an anomaly" because the trend was to turn over to local officials the flexibility to make their own decisions. All Texas was saying is, "Let us finish this ourselves." In this case, "this action is infinitesimal even if it were to cause some little harm to the environment."

Senator Baker said he would support the Buckley amendment. He did not want to interfere in the affairs of the State of Texas:

> I cannot help but express my concern for the precedent being set here. I have a somewhat dissimilar, but not entirely dissimilar, situation in my own State of Tennessee with respect to the Overton Park project, which is now involved in litigation . . . . I have never contended that it should be removed from the Federal system, or that the law of the United States should not be complied with. Rather, I believe, that we should get about the business, as fast as possible, of resolving this dispute so we can build the highway, not remove it from the Federal system.

The Buckley amendment may cause some hardship to the people of Texas, but Senator Baker thought the issue was "important in principle."

Senator Tower wanted to underscore Senator Domenici's observations. The route for the North Expressway had been approved and the right-of-way acquired years ago, and a great deal of money had been spent before enactment of NEPA:

> The matter became fouled up in a faceless bureaucracy here and was subjected to the whims of some arbitrary civil servant who treated the people of San Antonio with the arrogance of a maharajah. I do not think our cities should be subjected to that kind of treatment.

The spirit of environmentalism, he said, dictated opposition to the Buckley amendment:

> [If] you want to foul up the environment in San Antonio, [then] force the people to buy the right-of-way for another route, leave this structure a useless eyesore, force them to buy another route and use up other valuable land.

Senator Randolph pointed out that in 1972, the Senate undertook "a very thorough debate" on the Buckley amendment and then chose to vote 49 to 24 to reject it. Referring to Senator Bentsen, Senator Randolph said, "I believe that today he has again made a case for the rejection" of the amendment.

Senator Buckley said this was a new Congress with new members who had not participated in the debate in 1972. The Congress was "not, in my judgment, bound by such precedent as we may have established last year" on the amendment.

He also wanted to reply to the argument of injustice based on timing:

> The fact is they did not first apply for Federal funds until 1968, or 2 years after the enactment of section 4(f). Federal approval did not come until August 13, 1970, 8 months after the enactment of NEPA. There was nothing to stop the city of San Antonio from proceeding, however it wanted, without Federal funds, as its willingness to return those funds confirmed.

He acknowledged the popular votes in favor of the North Expressway. "I suggest that they did not necessarily vote for this precise route, given the number of alternatives that are available . . . ."

Senator Gaylord Nelson concluded the debate on the Buckley amendment. He began generally by recalling that in 1970 he had said that a national environmental agenda for the 1970s must begin, as he phrased it then, "to utilize the billions of dollars a year that could be made available on completion of the Interstate Highway System to provide new transportation alternatives, including mass transit, in our polluted, congested, highway-choked urban areas."

He said that S. 502 "responds to our changing transportation needs in this country." One way it did so was by addressing a unique situation in Wisconsin involving delays in construction of I-57 south of the Saukville interchange leading into Milwaukee. At the State's request, FHWA had designated I-57 (Milwaukee to Green Bay) in December 1968 as part of the 1,500-mile Interstate extension authorized by the Federal-Aid Highway Act of 1968. For the section of I-57 into Milwaukee, the State would not be able to meet the deadline of July 1, 1973, for submitting a schedule for completing construction within the period of availability of Interstate funds. The Secretary of Transportation was to remove the designation of all segments that failed to meet the deadline.

Senator Nelson explained that at his request, Section 112 of the Senate's Federal-Aid Highway Act of 1972 provided that for projects added under the 1,500-mile extension, the first qualifying deadline would be changed to July 1, 1974. The House had not included the deadline switch and it did not survive into the conference bill. However, after the legislation failed on the last day of the 92nd Congress, Senator Nelson secured an assurance from Senator Randolph that the issue would be addressed in 1973.

The routing of I-57 in Milwaukee via the proposed Stadium Freeway was still under debate, but whatever the routing, the State could not set the schedule for construction. The Governor and local officials had reached an agreement "which conditions this project as well as some others on a show of substantial progress in off-setting the housing deficit in Milwaukee resulting from past construction of all kinds." State legislation had been enacted to establish a Wisconsin Housing Authority that would address the problem, but the legislation faced a court challenge claiming that it conflicted with the State constitution. Section 112 of S. 502 would, like its predecessor in 1972, address the deadline problem for Wisconsin.

Following the discussion of I-57, Senator Nelson addressed post-Interstate needs:

> In order to turn the focus of attention on creating a truly balanced transportation system in this Nation, however, we must also have a greater degree of flexibility to meet the specific and varying needs of each State, urban and rural. Now is the time to allow a wider degree of

> discretion and alternatives to State and local governments in the allocation of Federal transportation funds to essentially local transportation needs.

For that reason, he had supported the Williams and Muskie-Baker amendments the day before:

> If our focus is to be on the best possible transportation for the maximum number of people, we cannot limit our flexibility or dictate our transportation financing options. A singular choice is really no option at all. Allowing the steadily available dollars of the highway trust fund to be applied to mass transit in our urban areas, if local government wishes to use their share of funds in such a manner, provides a real alternative.

He did not say so, but his concern about the deadline approaching for I-57 was not an attempt to exempt the segment from environmental or right-of-way requirements; he wanted to give the State more time to do so. The provision exempting San Antonio's North Expressway from Federal oversight was another matter. He concluded his floor presentation by supporting the Buckley amendment:

> The National Environmental Policy Act established in law and principle that Federal and federally aided projects should be carefully reviewed for their environmental impact before they are undertaken. If we begin now, under whatever guise, to excuse projects from such requirements, Congress will simply be writing the beginning of the end of this vitally important environmental protection law . . . . While this particular exemption would appear to have a very limited narrow application, we can be sure others who might wish to avoid environmental studies will be tempted to view it as a possible precedent . . . .
> I express my strong opposition to the San Antonio exemption and urge Congress to require that this project comply with the law. While this particular exemption would appear to have a very limited narrow application, we can be sure others who might wish to avoid environmental studies will be tempted to view it as a possible precedent.

The Senate vote was closer than in 1972, but still went against the amendment, 50 to 43. [*Congressional Record-Senate*, March 15, 1973, p. 8184-8193]

(Wisconsin officials wanted to use the number 57 for the new Interstate between Milwaukee and Green Bay because they planned to route the Interstate along State Trunk Highway 57 north of Saukville. The number was approved in 1969. However, a routing controversy resulted in a shift of the route to the U.S. 141 corridor along Lake Michigan. In 1974, the route was renumbered I-43 to avoid confusion with I-57 between Sikeston, Missouri, and Chicago, Illinois.)

The next amendment was considerably easier. Senator Hugh Scott introduced an amendment to designate a transcontinental route the "Dwight D. Eisenhower Highway" as initially suggested by Secretary Volpe. It specified the routing via I-70 from Washington, I-25 from Denver, and I-80 from Cheyenne, Wyoming, and indicated that all references to these segments should designate them by this new name. Senator Scott did not need to take much time on this amendment. He said:

> President Eisenhower was a forceful advocate and initiator of our present Interstate Highway System, which was created during his administration. The adoption of my amendment would be a fitting tribute to the man who made so many contributions to develop the outstanding highway system we now have across the country.

Senator Randolph pointed out the importance of designating public facilities "to call attention to certain men in public and private life who have been instrumental in moving the country forward." President Eisenhower provided "the leadership from the executive branch of Government, in bringing to being this program, which has been of great importance to the strengthening of America, the servicing of our people."

Senator Bentsen and Senator Stafford briefly indicated their support and then the amendment passed on a voice vote. It passed. [*Congressional Record-Senate*, March 15, 1973, p. 8193-8194]

Senator Hansen introduced his amendment to repeal the weight limit restrictions in Section 127 of Title 23, United States Code. Section 127 imposed a weight limit of 18,000 pounds on a single axle and 32,000 pounds on a tandem axle for trucks using the Interstate System. The restrictions had not been changed since they were included in the Federal-Aid Highway Act of 1956. "In adopting Section 127, the Congress relied upon the size and weight recommendations of the American Association of State Highway Officials—AASHO—a recommendation which in 1956 was 10 years old." His amendment would return regulation of size and weight to the States:

> I have no fear whatsoever of the States abusing that jurisdiction, because money for highway maintenance is provided exclusively by the States. There is no Federal-aid whatsoever for highway maintenance costs. Furthermore, there is no evidence that Interstate highway maintenance costs have been excessive or unusual in those States who were grandfathered in 1956 and whose limits exceed 18,000 pounds for a single axle and 32,000 pounds for a tandem axle.
>
> It is significant in my judgment that eight western States have enacted legislation permitting axle limits for non-interstate highways that exceed the limit for interstate highways . . . . My purpose in offering this amendment is solely to give an opportunity to the Western States to increase their ceilings to the standards recommended by the Bureau of Public Roads in 1964 [as a result of the AASHO Road Test].

Earlier in the week, AAA spokesman Chuck Brady had said, "This is one of those sleepers. Nobody's paid any attention except us and the truckers." Both sides agreed that the provision in the 1956 Act was a bar to bigger trucks; they disagreed only on whether this was a good thing. The resulting State-by-State limits were "a crazy quilt," according to a Hansen aide. AAA was concerned that if the ban were dropped, "we'll soon see trains of wide trucks and trailers on the highway," resulting in higher maintenance costs and increased safety hazards. "The law has helped to hold the line," said Brady. [Braestrup, Peter, "Sleeper in Bill Would End Curb on Interstate Trucks," *The Washington Post*, March 13, 1973]

On the Senate floor, Senator Henry M. "Scoop" Jackson (D-Wa.) said that if weight limits were left to the States, "the State that raised it the highest would set the standard" because the other States would be pressured to accommodate the heavier vehicles. Senator Hansen replied that "a person might assume" that to be the case, but he did not think so, primarily because the States are responsible for 100 percent of maintenance costs:

> I cannot envision that any State would be so irresponsible as to assume it would abandon all caution and throw good judgment to the winds and say that while we legally can go higher than we should go, that is what we will do, rather than working at keeping the Interstate System in repair and making such changes as would conform to the standards in the system now.

Senator Jackson responded that "it seems to me to be logical for the Federal Government to insist on uniformity . . . in connection with usage by the trucking industry on those roads." Senator Hansen pointed out that because of the grandfather provision, the States were not uniform at this time. "All we are asking is that the States may have control over policies and actions in those areas where it is not inappropriate."

Senator Jackson, with support from Senator Buckley, argued that instead of eliminating all limits, perhaps the legislation should establish a national level comparable to the prevailing limits. Senator Hansen pointed out that in 1968, the Senate had approved a measure to increase the limits to 20,000 pounds for a single-axle and 34,000 pounds for the tandem axle based on a BPR recommendation, but the House did not consider the provision.

Senator Stafford referred to "the long and controversial history of legislation dealing with the subject of larger buses and trucks and of the inability of the Congress to reach any agreement on the matter after prolonged study and debate." He did not think it would be appropriate "to attempt to legislate this issue on the floor without the benefit of committee deliberations." He was particularly concerned about the safety implications of larger trucks and buses:

> There are too many unanswered questions of safety—of survival on our highways—to act on this sweeping proposal at this time on the floor of the Senate. Our highway death toll is a national disgrace as it is. We should not take any action here today that may hinder our efforts to reduce that highway death toll.

Senator Hansen did not consider the safety issue to be "germane to the amendment." He pointed out that Senator Stafford's State of Vermont is one of those with higher, grandfathered limits:

> So it seems somewhat inappropriate to me that the question of safety should be raised by my good friend from Vermont, because I think that the action taken by the Bureau of Public Roads in urging that the width be increased and the action taken by the Senator from Vermont pretty well speak for themselves.

Senator Stafford conceded that his State had higher limits, but said:

> It comes right down to this. That the operators of trucking concerns, as long as we have some reasonable limits on the Interstate System, are not generally going to buy trucking equipment which is larger than they can operate on the Interstate System. So, in Vermont and many States like it, while axle weights are larger than on the Interstate, the truck operators, in fact, buy equipment which complies with the Interstate requirements, rather than the State law.

Senator Hansen agreed, but added:

> We can continue as we now do and it will take far greater numbers of trucks on the American highways today to move the same amount of material. I think that in itself endorses this amendment.

Senator Kennedy said that he opposed this effort "to sidestep normal Senate procedures . . . ." The amendment "denies the Senate and the Congress the opportunity to judge the safety impact of this action," let alone the financial impact on the States. "Every time in the past, when this has been attempted, we at least have had the benefit of hearings."

The Hansen amendment was soon defeated, with 23 votes in support and 67 opposed. [*Congressional Record-Senate*, March 15, 1973, p. 8194-8200]

When Senator Cotton's time came to introduce his amendment on I-93 through Franconia Notch, Senator Bentsen first introduced remarks submitted by Senator Nelson for the record because he could not be on the Senate floor at the time. "I would like to express my opposition to any amendment which would exempt this proposal in any way from full consideration of its environmental impact and of requirements in Federal law to protect park land wherever possible from any highway development."

Senator Nelson included an analysis by the Highway Action Coalition of the controversy. The four-lane I-93 had been routed through Franconia Notch State Park, which included the rock formation known as the "Old Man of the Mountain," the iconic symbol of the State of New Hampshire. Conservationists were concerned that traffic vibrations would cause landslides and rock damage that might harm the Old Man of the Mountain, "and would create an unwelcome intrusion of noise, air pollution and concrete into the Park environment." The Interstate also would "consume a large part of the usable land on the floor of the narrow valley."

On March 2, 1970, Secretary Volpe had informed the State that construction was to be indefinitely postponed in view of his responsibilities under Section 4(f) and NEPA. Further, he did not believe that projected traffic volumes warranted a full-scale Interstate. He suggested the State consider alternatives, possibly involving parallel U.S. 3, and reiterated his opposition to the planned Interstate in the fall of 1972. However, a reduced-scale highway would not satisfy the design requirements for an Interstate route.

Senator Cotton explained that his amendment expressed the sense of the Senate that the Secretary of Transportation should reconsider a request from any State to build a parkway instead of an

Interstate if the request were approved by the Governor, the State Legislature, the Department of Public Works and Highways, and the State's congressional delegation. He added that he had written the amendment in general terms, instead of specifying I-93 in New Hampshire, but that facility was the only one covered by the amendment.

He said that he and other State officials had visited Secretary Volpe shortly after he took office to make their case:

> We all went down and had a hearing to express the desire of New Hampshire. All precautions had been taken. No hazard to the natural objects up there from blasting or otherwise would have to be faced, because the new lane would be on the opposite side of the Notch—from the side of the Old Man in the Mountain [sic].
>
> Now, Mr. Volpe sought to be fair. But the Secretary of Transportation rejected the request of our delegation . . . and the highway was not able to be constructed through the Notch.

He acknowledged that under current law, the Interstate would have to be open to multipurpose traffic, including trucks, and could not be limited to noncommercial traffic as his amendment would accomplish. The amendment would express the sense of Congress that the Secretary should consider the State's proposal for a parkway design and exempt it from the design requirements for an Interstate highway. The resulting project also would send trucks and other heavy traffic by an alternative route. "As a result, you would not have the situation we now have of people driving through the Notch, trying to see the Old Man in the Mountain [sic], and running into other cars."

Senator Stafford asked Senator Cotton "whether or not there is any intent in his amendment to seek exemption on meeting environmental requirements, so far as the amendment is concerned?" Senator Cotton replied:

> There is absolutely nothing in the amendment that denies to any person, any environmentalist, or any ecologist the full appeal to the courts. All we seek is reconsideration. Then, before we proceed all persons will have all their rights protected by the court.

Senator Bentsen said he had opposed the original version of the amendment, but he wanted to confirm that the revised amendment did not mandate construction of the highway and that it was merely expressing the sense of the Congress that the Secretary should reconsider the State's proposal. When Senator Cotton confirmed this understanding, Senator Bentsen offered his support.

After Senator Randolph offered his support, Senator Cotton said that "having tried cases for many years, I know that when the court is with you, it is time to stop arguing your case." He requested a vote. The Cotton amendment was agreed to by voice vote. [*Congressional Record-Senate*, March 15, 1973, p. 8204-8206]

By this time in the debate, Senator Byrd asked if future amendments could be subject to limited time in order to get through all of them. That having been agreed to, the Senate turned to an amendment from Senator Abraham A. Ribicoff (D-Ct.) concerning New York's plan to build a 16½-mile bridge across Long Island Sound from Rye in Westchester County to Oyster Bay in Nassau County. Although the bridge would be in New York, it would affect Connecticut:

> The proposed structure will have an immense impact not only on New York, but on the entire Long Island Sound region. Because its northern end is located only a few miles from the Connecticut border, this bridge will funnel millions of cars and trucks onto the already overcrowded Connecticut Turnpike and Merritt Parkway.

New York's MTA estimated that the bridge would carry 33 million cars a year, "half of which would be overflow traffic from other New York bridges and half of which would be newly created." Because the authority "has kept important information from the public, it is difficult to predict what impact the bridge will have on the local ecology." However, Senator Ribicoff predicted that it would create chaos for shipping on the sound and that "noise will increase, the sound's water quality will deteriorate, the air will grow dirtier, and valuable wetlands at both ends will disappear."

Connecticut did not want this bridge to be built. His amendment provided that the Secretary of Transportation could not approve any project that would significantly affect a contiguous State's highway system without the concurrence of that State.

Senator Bentsen indicated he concurred (signaling that the Committee on Public Works recommended approval) and the amendment was approved by voice vote. [*Congressional Record-Senate*, March 15, 1973, p. 8214-8216]

Senator Scott took a few moments to discuss Section 152 of S. 502, the provision concerning I-66 in Virginia. He said that he had requested a seat on the Committee on Public Works primarily because of his interest in the completion of I-66 from the Capital Beltway into Washington. At the committee's organization meeting on January 18, 1973, he had expressed this interest, and had repeated his interest during the hearings on S. 502.

He explained that I-66 "is an integral part of our overall balanced transportation system in the area, and an important link in moving the suburban commuter and the visitor in and out of our Nation's Capital." Section 152 set a precise schedule for considering the issues and completing all determinations necessary for construction. "When a matter has been under construction [sic] for 17 years and the road still is not built, then it seems reasonable to me that some dates for administrative action should be taken . . . ." He was pleased that the committee had included his amendment in S. 502 and he hoped the House of Representatives would do the same. [*Congressional Record-Senate*, March 15, 1973, p.8216-8217]

Senator Weicker, with support from Senator Kennedy, introduced an amendment that modified Section 105 ("Programs") of Title 23, United States Code. Section 105 provided that as soon as practicable following apportionment of Federal-aid highway funds for a fiscal year, the State highway agency shall submit a program or programs of proposed projects for approval by the Secretary. The Secretary may approve the program except for any projects not on the Federal-aid systems.

Among other things, Senator Weicker's amendment replaced references in Section 105 to the State highway department with the Governor. He explained that under his amendment, "any highway construction project funded with Federal money must be part of an overall transportation plan rather than simply a highway plan. It also says that the Governor has ultimate responsibility for such planning and not just State highway officials. He added:

> This amendment is important because it recognizes that highways, while a vitally important part of any balanced transportation system should not be planned in isolation from mass, inter-city rail or air transportation facilities. All should tie in with each other. All should recognize the varying environmental, social, and economic impact of alternate modes of transportation in all areas—rural as well as urban.

Senator Kennedy added that under the amendment, "any highway project funded with Federal money must be part of a comprehensive transportation plan rather than merely be covered by a highway construction design. And it says that the final authority should be with the official who is elected by all of the people of the State, the Governor, rather than the State highway departments." Under the present system, a Governor can "rightfully claim that his hands are tied" if people disliked the State highway department's choice. This amendment would ensure accountability "by pinning the final decisionmaking responsibility on the Governor."

Senator Bentsen indicated his support, saying "this amendment complements the bill and is a good addition to the bill. The Senate agreed to the amendment by voice vote. [*Congressional Record-Senate*, March 15, 1973, p. 8217-8218]

Senator Robert Dole (R-Ks.) introduced an amendment to add two routes to those identified in Section 146 of S. 502 to determine the "feasibility and necessity for constructing to appropriate standards proposed highways . . . ." One route was from Wichita, Kansas, to Tucumcari, New Mexico. The other was from Kansas City, Missouri, to Baton Rouge, Louisiana. Both, he said, were important to his State of Kansas. After Senator Bentsen said he supported the amendment, the Senate adopted it by voice vote. [*Congressional Record-Senate*, March 15, 1973, p. 8218-8219]

Senator Domenici introduced an amendment eliminating the provision of S. 502 apportioning one-half of 1 percent of Interstate construction funding to any State that completed its designated mileage:

> My concern, Mr. President, and Members of the Senate, centers on what I believe is a very bad precedent. It seems to me that what the committee language . . . does is say to the States, "When you complete the Interstate System we are going to give you a bonus. We do not really know why. We do not know whether you finished because you did a better job than others." We are going to say to the other States that they did not finish, and we are not going to give them that bonus. We do not know why. We have just decided that those States that have finished will get additional revenues to complete other highway programs in those States.

Senator Burdick, representing North Dakota, one of the three States that would benefit from the one-half of 1 percent apportionment at that time, objected. From the start of the program in 1956, the State highway departments had been told to make the Interstate System their top priority:

> The mandate was clear—to move swiftly toward early completion of the Interstate System. It seems now that three States may have completed [their Interstate segments] too fast for their own good . . . . Ironically, if the proposed amendment passes, it would have been more advantageous for the three States to prolong Interstate completion even though this would have cost the Federal Government more money in terms of rising construction costs now estimated to be about 10 percent a year.

He explained that Congress originally anticipated that the States would complete their segments simultaneously. That would have resulted in a smooth transition from Interstates to non-Interstates. In part because Congress added 1,500 miles to the Interstate System in 1968, simultaneous completion was no longer practical. He offered a substitute amendment making clear that the one-half of 1 percent is "an interim provision to be reconsidered at the expiration of this authorization."

With support from Senator Bentsen, the Senate agreed to Senator Burdick's substitute amendment, again by voice vote, after the measure was limited to the 3-year authorization period covered by the 1973 Act. [*Congressional Record-Senate*, March 15, 1973, p. 8219-8221]

Senator Paul J. Fannin (R-Az.) introduced an amendment that would increase the width of buses allowed on the Interstate System from 96 inches to 102 inches. He mentioned that hearings had been held on the issue in December 1971 and February 1972, but that the issue was deferred until the Department of Transportation completed a report on the issue. On January 22, 1973, Secretary Volpe sent the report to Senator Randolph. The study by FHWA and NHTSA concluded:

> In summary, the 102-inch wide bus is safe. The research did not indicate any properties of 102-inch wide buses which would suggest that they pose an increased hazard to cars, despite the fact that lateral maneuvering space is reduced by 3 inches or half the additional bus width. On the Interstate Highway System, lanes are at least 12 feet wide and the 3-inch width increase still allows car maneuver space of at least 53 inches, which is adequate for all operating conditions.

He pointed out that his amendment was wholly permissive, leaving each State to decide whether to permit wider buses on its Interstate highways.

Senator Bentsen said the Fannin amendment was more narrowly drafted than the Hansen amendment that had been rejected earlier "in that it pertains only to increasing the width of buses to a specified size rather than lifting all limits on the size of buses and trucks." He did not say he supported the amendment but he did say he would not oppose it.

Senator Stafford was concerned that the limited increase "may be a foot in the door which will result in additional amendments which can be offered or may be offered to increase the size of trucks and buses, as well. He opposed the amendment.

After Senator Baker briefly indicated he opposed the amendment, Senator Harold Hughes (R-Ia.) asked Senator Fannin several questions:

- Was the decision on bus width purely optional? "That is correct."
- Could a wide bus from Chicago ride through Iowa if State had not authorized that width? "It is my understanding that this is permissive legislation."
- What would happen when these buses leave the Interstate to get to their destination? "I think he [Senator Hughes] realizes that city ordinances and State laws would be effective in this respect."
- Is it the intention of the bus companies to use this extra width to increase passenger comfort. "That is correct. I think there is a safety factor, too, as far as bus construction is concerned."
- What is the width of a two-lane Interstate highway? "On the Interstate Highway System the lanes are at least 12 feet wide."
- If two wider buses were passing each other, they would have 208 inches? "There would be a clearance of 53 inches."
- Does the Senator have the engineering dynamic studies on these buses? "I can answer . . . that there is a negligible difference in aerodynamic disturbance effects between 96-inch and 102-inch buses."
- Would a wider bus passing an automobile in a high wind have a dangerous effect? "I do not think there would be."

Senator Hughes stated that he asked these questions because of his concern about "putting wider vehicles on highways that are already glutted with traffic, particularly on holiday weekends and summer vacations." Senator Fannin said he thought the amendment would have the opposite effect because the more comfortable buses would encourage more drivers to take the bus instead. Senator Hughes was unconvinced, concerned that as Senator Domenici had said, this amendment was a "foot in the door."

The Fannin amendment was defeated, 14 to 68, with Senator Hughes among those opposed. [*Congressional Record-Senate*, March 15, 1973, p. 8221-8223]

Senator Baker introduced an amendment that modified the pass-through provision of S. 502. It would allow the municipalities or combination of agencies to undertake any Federal-aid urban system project "which shall be planned in accordance with the planning process required by section 134 of this title*, and which shall not be in conflict with any State Transportation Plan approved by the Governor*." (Amendment in italics.) "While the amendment does not endanger the powers given to urban areas meeting the criteria of the pass-through provision of the bill, it assures that projects undertaken under that section will not impede the efficiency of statewide transportation programs." He said he was mainly concerned that urban plans not conflict with the hard work of the Tennessee Department of Transportation in developed "a forward-looking plan." With Senator Bentsen's concurrence, the Senate approved the amendment. [*Congressional Record-Senate*, March 15, 1973, p. 8223]

Senator Baker also introduced an amendment that called on the Secretary of Transportation to study revenue mechanisms, such as a fuel tax, that could be used to finance transportation activities receiving assistance from the Highway Trust Fund, with a report due by July 1, 1974. His goal was "to explore revenue mechanisms relative to mass transportation systems which would afford the basis for preserving the 'pay-as-you-go' feature of the trust fund." He added that he did not believe that "a concept so basic to the trust fund should be discarded." He continued:

> The study will disclose among other things the amounts which public transportation systems already contribute to the fund or would contribute under the existing tax setup, and how any additional tax burden should be distributed in order not to penalize those systems which do not share in the trust fund.

He did not expect the added amounts to be substantial initially. "But it is my belief that in time as the concept of urban mass transit becomes more popular these systems may become major contributors to the fund."

Senator Bentsen raised no objection and the Senate approved the Baker amendment by voice vote. [*Congressional Record-Senate*, March 15, 1973, p. 8223-8224]

Senator Baker's amendment was the last one considered.

Senator Bentsen began the concluding remarks:

> Mr. President, we have had a long and vigorous debate on this measure, and I believe we have aired many of the difficult and controversial matters associated with the highway program.

After committee leadership complimented each other and their staff and several Senators engaged in colloquies on specific measures, including amendments they had intended to introduce but did not, the Senate voted 77 to 5 in favor of the $18 billion, 3-year Federal-Aid Highway Act of 1973. Senators Kennedy and Weicker voted "Yea," while Senator Muskie was among the 18 Senators who did not vote. [*Congressional Record-Senate*, March 15, 1973, p. 8224-8232]

Reporting on the vote, *The New York Times* considered the Senate's rejection of Senator Hansen's amendment on size and weight limits to be the major story on March 15. "Because most truck and bus routes include mileage on Interstate highways, the law has the effect of restricting the size of vehicles on nearly all roads." The article pointed out that:

> Trucking interests have lobbied in Congress for years for increasing or eliminating the limits. But environmentalists and organizations of motorists have opposed any change, and the truckers have never succeeded.

The article described the Ribicoff and Muskie-Baker amendments and Senator Williams' Emergency Commuter Relief Act, each of which had been included in the bill:

> The Nixon Administration supports diverting trust fund money into mass transit, but it opposes operating subsidies. An Administration spokesman said today that President Nixon

> would veto the bill if the final version contained the operating grants. [Rosenbaum, David E., "Senators Retain Truck, Bus Limits," *The New York Times*, March 16, 1973]

Engineering News-Record reported that transit advocates "were jubilant after the Senate action, while pro highway forces in Washington were regrouping for the crucial showdown on the House floor." The article continued:

> A spokesman for the Highway Users Federation said, "We're heartened by the closeness of the vote on the Muskie amendment (it carried 48-26 last year). It will give us a better chance in conference this time around."

The House's recently renamed Subcommittee on Transportation was opening hearings on its bill the following week. "Despite the fact that its chairman, Rep. John Kluczynski (D-Ill.), recently reversed his long standing opposition to diversion . . . the full committee is expected to retain its previous stance."

The Highway Action Coalition was not worried. "Says its director John Kramer, 'We're going to win on the floor.'" By contrast, a HUFSAM spokesman acknowledged that the House makeup in 1973 was more "urban-oriented" than in 1972 and predicted that "the floor vote is going to be very close."

The Senate version, the article stated, contained two provisions—funding for transit operating subsidies and the Bellmon amendment prohibiting impoundment of Federal-aid highway funds—that could attract a presidential veto. "The Administration has staunchly opposed operating subsidies for public transit. And Nixon contends that the executive has the power to impound appropriated funds." ["Senate Again Votes for Highway Trust Fund Diversion," *Engineering News-Record*, March 22, 1973]

The Los Angeles Times commended the Senate for approving the Muskie-Baker amendment. "For the second straight year, there is a question of whether the House will show a similar sense of responsibility to the transportation needs of the cities and concur in the Senate's action." Concurrence was "imperative" if urban areas were to relieve "the terrible congestion" they faced. The House was the "big hurdle because it is there that the influence over key committees by the highway lobby—a coalition of interests that profit from the building and use of roads—is most powerfully felt."

The editorial acknowledged that the Interstate System was "a good system that allows rapid travel from one state to another," but "what the nation now needs are good systems to allow rapid travel from one side of a city to another." It added:

> Breaking open the trust fund makes sense not only because most cities desperately need efficient mass transit systems as a supplement or alternative to increasingly inefficient reliance on autos, but because the federal highway program no longer can usefully absorb all of the money earmarked for it. ["Breaking Open the Highway Fund," *The Los Angeles Times*, March 16, 1973]

The Baltimore Sun, in another city wrestling with highway controversies while trying to boost mass transit, also commended the Senate action. "If the House of Representatives goes along, then a real turning point in the development of American transportation policies will have been taken." It continued:

> "Busting the trust," as it has come to be called, has been the goal of those who favor balanced transportation development. They argue, and we agree, that the idea of an exclusive trust fund for highways only is shortsighted and illogical. If there has to be a trust fund in this field, it ought to be a general transportation fund (as in Maryland), since the needs of motorists and transit passengers are so related.

The editorial explained that "the idea of a sacrosanct trust fund is not all that traditional," having been created only in 1956 to include revenue mainly from longstanding excise taxes. "This fund has been successful. It did what it was created to do—built an interstate system and greatly improved other federal aid roads. But times change." ["Busting the Trust," *The Baltimore Sun*, March 16, 1973]

Sun columnist Ernest B. Furgurson was not optimistic that "common sense" would prevail in the House where "a powerful bloc" wanted to restrict 100 percent of the Highway Trust Fund revenue "to the exclusive task of paving over the rest of the country." He explained:

> The bloc of legislators is in league with such selfless lobbying outfits as the American Trucking Association [sic], the Highway Users Association (another cover name for the truckers and their friends) and with various state highway officials whose bureaucratic empires are founded on continued restriction of the money to highway building.

They were upset about the Muskie-Baker amendment "as if it heralded the end of the free enterprise system." Furgurson pointed out that the $850 million in Federal-aid urban system funding represented less than 5 percent of the total authorized funds. "And it is not as if the urban areas would be ordered to use it for buses, subways or trains; they would merely be allowed to, and be just as free to use it for more freeways if they wished." He added:

> It is not the money, it is the principle of the thing. The principle is that the highway "trust" fund, because it comes from federal taxes on gasoline, tires and trucking tonnage, should not be used for anything that would not benefit buyers of gasoline and tires and operators of trucking lines—only more highways.

The concept "is bogged down way back in the Nineteen-teens, in the days when young Lt. Dwight Eisenhower drove across the continent [in the 1919 Army convoy] and wisely concluded from that experience that we could use a better road system." Four decades later, he had signed the Federal-Aid Highway Act of 1956 and now, in the 1973 Senate bill, a transcontinental route was to be named after him:

> But as Eisenhower himself might appreciate by now, things have changed. The automobile had metamorphosed from servant to master. The highway has passed the point of merely

> linking towns and cities, until now it functions mainly to channel congestion and pollution back and forth from cities to suburbs.

Furgurson concluded that "to continue to ram roads into our cities without making a major effort to develop parallel systems is to assure our strangulation . . . ." [Furgurson, Ernest B., "Common Sense and Highway Money," *The Baltimore Sun*, March 18, 1973]

A *Washington Post* editorial said the vote on the Muskie-Baker amendment gave "a big boost" to the "campaign for saner urban transportation policies." It was "an important victory for the crucial principle of flexibility in metropolitan transportation planning." This flexibility was also reflected in the provision allowing a Governor to cancel controversial Interstate projects.
Overall, the bill was "generally sound," although it included several "special-interest" provisions, such as the provision allowing Texas to build the North Expressway through a park in San Antonio. The amendment to kill this provision failed in the Senate, but "by the surprisingly small margin of seven votes." The editorial explained, "This outcome suggests a rising impatience with efforts to build highways by circumventing environmental laws."

The prospects in the House were "more encouraging than in the past, thanks to President Nixon's strong support for reforms in transportation policies, and the recent conversion of Rep. John C. Kluczynski." His conversion, "spurred by the financial woes of Chicago's mass transit system, symbolizes a growing recognition that federal policies must be reformed to deal with the mass congestion and pollution which afflict the cities." Continued hard work "by the broad coalition which prevailed in the Senate" meant that "there is a real chance to achieve such reforms this year." ["Roads, Rails and Realities," *The Washington Post*, March 21, 1973]

Washington's *Star-News* considered the Senate vote "a dress rehearsal" for the "real show" that was beginning with the start of hearings by the House Committee on Public Works. A similar bill, the editorial reminded readers, had passed the Senate in 1972 but died in the House, "where opposition was strongest to further encroachments on the highway trust fund for non-highway uses."

The editorial asked, "Can the wall be breached this time?" It answered, "We fervently hope so." It explained, "The case for viewing urban transportation as a multi-faceted problem, in which roads are only a part, is indisputable—and the Senate bill merely nibbles at that approach."

Citing Senator Muskie's comments about the highway user taxes prior to 1956, the editorial declared the idea of a "sacrosanct" Highway Trust Fund to be "a myth that has grown with age."

The diversity of transit-related provisions in the Senate bill was "an encouraging change in congressional sentiment that clearly was absent only a few years." The Nixon Administration's "enlightened support has been most helpful and should be exerted anew in the House." ["Transit's Big Chance," *Washington Star-News*, March 20, 1973]

Ramifications

Officials were looking at the legislation from the perspective of their own transportation issues. In Maryland, for example, Secretary Hughes had announced on February 22 that the State would not build I-95 through Prince George's County into Northwest Branch Park. In Washington, the route was to connect with the I-70S North Central Freeway, a segment that faced intense opposition by residents. Short of killing the project outright, he recommended considering an alignment along a Potomac Electric Power Company (Pepco) transmission line paralleling New Hampshire Avenue.

Addressing a meeting of the steering committee of the Western Prince George's Transportation Alternatives Study at Parkdale High School, Secretary Hughes said:

> I am in no way convinced that this option is feasible or desirable in terms of the ultimate outcome of the study. There are several compelling reasons, including legal considerations, for its inclusion . . . ."

The Secretary had previously killed a spur of the North Central Expressway from the Capital Beltway near Silver Spring south into Washington. [Eisen, Jack, "Official Kills I-95 Route Into D.C.," *The Washington Post*, February 23, 1973]

Now, with approval of the Senate's bill, States such as Maryland and Massachusetts potentially had an option to replace unwanted Interstate segments, not with other Interstate segments, but with other highway or transit projects. *The Baltimore Sun* pointed out that the "sleeper provision" could mean "a whale of a lot of money if the House of Representatives sees fit to retain" the Interstate transfer provision. Although Maryland had built 326 miles of its 358-mile Interstate network, "the most expensive—and most controversial sections" in the Washington and Baltimore areas remained only lines on the map.

The newspaper pointed out that Maryland was due over $1.1 billion, which was "more than the total $975 million cost of the first 28-mile phase of the rapid rail transit system proposed in Baltimore." The unbuilt Maryland sections of I-95 and I-70S in the Washington area accounted for part of the money, but Baltimore's controversial "3-A system" was responsible for the larger share. The 3-A system consisted of "extending I-70N through Leakin Park to intersect with I-95 near Washington Boulevard, building a boulevard through the Franklin-Mulberry corridor, and building the Eastern portion of I-95 under Fort McHenry to Canton and out through the Northeast area to link with the Kennedy expressway." Mayor Schaefer, according to a spokesman, was "committed to a 3-A system and that's the way he wants it to stand."

In the wake of Senate action on the 1973 Act, Secretary Hughes and Governor Marvin Mandel "were noncommittal on the possibility of using expressway money for buses or rail transit." The Secretary was "on record as preferring to use any unspent urban interstate funds on improving primary and secondary roads in the state." He would allow the use of the funds for mass transit, according to a spokesman, only "if and when it's demonstrated that currently planned highways can't be built."

John Kramer had lobbied Maryland's Senators to support the transfer provision:

> Mr. Kramer also said Mayor Schaefer, Governor Mandel and Mr. Hughes are "very key figures" in the national bill, due to their leading roles in national political and transportation groups. He said Governor Mandel had been "very helpful" in pushing for use of the highway trust for urban transit, and could be very influential in swinging needed votes in the House, where the Maryland delegation, for instance, is split down the middle. [Hill, Frederic B., "Funds for 3-A Road Could Go to Mass Transit," *The Baltimore Sun*, March 19, 1973]

In New York, the Ribicoff amendment on the Long Island Sound bridge was of special interest. The *Times* reported that the amendment passed by "voice vote and with little discussion" to give Connecticut "veto power over Federal funds for the bridge's access roads." The article explained:

> Initially, Mr. Ribicoff planned to offer an amendment specifically barring Federal funds for the Long Island Sound bridge's access roads unless the New York and Connecticut legislatures gave their approval. After discussions during the afternoon with the staffs of Senator James L. Buckley, Conservative-Republican, and others, the language was rewritten to omit any specific reference to the Long Island Sound bridge and to the legislatures of the two States. The Ribicoff aide said that the revised language "has the same immediate effect" of the Senator's original proposal.

Many residents and officials in Long Island, Westchester County, and Connecticut opposed the bridge. The State legislature had twice tried to rescind its earlier approval of the bridge, but Governor Rockefeller had vetoed the bills. A similar battle was expected in the current legislative session. [Madden, Richard L., "L.I. Bridge Faces a New Obstacle," *The New York Times*, March 19, 1973]

In February, Judge Lloyd F. MacMahon of the U.S. District Court had ordered the State to solicit additional information on social, economic and planning factors before holding public hearings. On March 16, the Department of the Interior indicated it would not grant easements for the access routes because they would harm a wildlife refuge that Oyster Bay Town had deeded to the Interior Department in 1968 to protect the area from the bridge. State Transportation Commissioner Schuler hoped Federal transportation officials could convince the Interior Department to change its position, but an FHWA spokesman pointed out that the Secretary of Transportation could not overrule the Secretary of the Interior. Governor Rockefeller was thinking of appealing to the White House. [Bender, Judith, "There's Hope for Bridge Yet: NY Aide," *The New York Times*, March 21, 1973]

Robert Cahn, a Pulitzer Prize winning staff writer for *The Christian Science Monitor* who specialized in environmental and parks issues and was a founding member of the Council on Environmental Quality, wrote about how the Senate came to include the San Antonio North Expressway provision in the bill. "Congress is being maneuvered to turn its back on its own environmental protection laws in the case of a controversial Texas highway," namely NEPA and Section 4(f). Senators Tower and Bentsen had "buttonholed colleagues seeking support, making deals for their votes on other legislation," with Senator Bentsen taking advantage of his post as chairman of the Subcommittee on Transportation.

Cahn, who had written about the San Antonio controversy periodically, disputed the claims the two Senators had made while talking with their colleagues–that NEPA was applied after the route had been set ("a point refuted by the court decision"), that the area where the highway would be built was not a park but a "flood retention facility" ("It includes 13 baseball diamonds, a golf course, a wilderness trail, and many other recreational facilities"), that "the" alternative route outside the park would displace many poor people ("Actually a number of alternative routes are available, one of which would take only a few homes of wealthy people in the City of Olmos Park"), and that city residents had twice approved the route ("a 1961 'approval' was on a bond issue that did not specify an expressway route" while a recent county petition in support of the expressway had secured 100,000 signatures but "wasn't checked for name and address validity").

Pro-park citizens had worked with national environmental groups to oppose the provision and enlisted Senator Buckley to lead the Senate battle. Secretary Brinegar and Chairman Train of the Council on Environmental Quality had expressed their opposition to the provision:

> On the day of the vote, the environmentalists were confident of victory. Surprisingly, six members of the Public Works Committee voted against Chairman Bentsen. But Sen. Henry M. Jackson (D) of Washington, principal author of NEPA, and Sen. Hubert H. Humphrey (D) of Minnesota, who had written letters to citizens saying he would vote against the San Antonio expressway, both voted against the Buckley amendment. This encouraged other senators who may have been hesitating.
>
> As a final blow, some Republicans received word on the day of the vote that the White House did not support Messrs. Brinegar and Train, that it was all right to back Senator Tower. When the roll call ended, Senators Bentsen and Tower had won by seven votes.
>
> Special Assistant to the President Tom C. Korologos was in the Senate reception room before the vote passing on the White House position to Senate Republicans. Had he urged support for the Buckley amendment, four more Republican votes could easily have been obtained, and the decision reversed.
>
> I asked Senator Jackson to explain his vote. He said the San Antonio case was unique, that no other exceptions would be allowed. So he felt the environmental laws would survive. Also, Senator Bentsen had assured him that the San Antonio provision was necessary, that the alternate route would take the homes of a thousand poor people.

If the environmentalists prevailed in keeping the San Antonio provision out of the House bill, Cahn wrote, "the issue will go to a House-Senate conference dominated by Public Works Committee members favorable to the Bentsen-Tower position." Cahn concluded:

> What has happened to date in the Senate is a blatant example of elected representatives acting for "special interest" and neglecting the national interest. [Cahn, Robert, "Texas

> Highway: Will Congress Ignore Own Rules?" *The Christian Science Monitor*, April 4, 1973]

(Cahn won a Pulitzer Prize in 1969 for a series of articles on the future of National Parks and ways of preserving them. On January 29, 1970, President Nixon announced his nominees to serve on the Council on Environmental Quality established under NEPA: Russell E. Train, then serving as Under Secretary of the Interior; Gordon MacDonald, a geophysicist on the faculty of the University of California at Santa Barbara; and Cahn, a Washington State native living in the District of Columbia. The President joked:

> And incidentally, I asked the three gentlemen, "Now, which one of you shall I call a doctor?" Of course, Dr. MacDonald is from the University of California at Santa Barbara. Russell Train said, no, don't call him a doctor, although I do think he has an honorary degree, and Mr. Cahn said, "No, I am just a journalist."

In September 1972, just a few weeks before the presidential election, MacDonald and Cahn resigned. In his book about Nixon's environmental record, J. Brooks Flippen said that, "While Cahn avoided direct criticism of Nixon, his disappointment was obvious. 'The bureaucracy has grown slow in giving weight to environmental factors in decision-making,' he explained. 'Correspondence with the White House was less than ideal.'" [Brooks, p. 131])

With the House about to take up the Federal-Aid Highway Act, newspapers looked to their State's congressional delegation to get a sense of their position on key issues. The *Sun* found that, "Maryland's eight members of the House of Representatives still are divided sharply on use of Highway Trust Fund money for urban mass transit." As in 1972, they were split 4-to-4.

In 1972, Representatives Edward A. Garmatz (D), Goodloe E. Byron (D), Lawrence J. Hogan (R), and William O. Mills (R) had voted against using the funds for transit projects. Representative Sarbanes, who had defeated Representative Fallon, had voted in favor of the measure along with Representatives Gilbert Gude (R), Clarence D. Long (D), and Parren J. Mitchell (D).

In 1973, Representative Margaret S. Holt (R), who had taken retiring Representative Garmatz' seat in the 1972 election, planned to vote against diversion. "I believe strongly in a balanced transportation system, but at this time, I don't feel we should go into the highway fund." Representatives Hogan and Mills confirmed that they were still opposed to diversion. ["Road Fund Splits Delegates," *The Baltimore Sun*, March 18, 1973]

In California, where compliance with the 1970 Clean Air Amendments was a critical issue, a canvass of the House congressional delegation found that it was "sharply divided as the issue heads for House action." The survey found that 13 of the Representatives supported diversion of Federal-aid highway funds for mass transit systems, including bus and rail. Four were leaning in favor of tapping the Highway Trust Fund. Four were "solidly against" the idea, while three were leaning in that direction.

The Los Angeles Times reported that Representative Glenn Anderson would be "leading the 'bust-trust' effort in the House," as he had in 1972. "We are giving local officials an effective tool to help solve the energy crisis, clean up our air, use our land more effectively and transport people in a safe, efficient and economical manner." He had lined up six cosponsors from the delegation for his version of the Muskie-Baker amendment, H.R. 101, but Representative Alphonzo Bell, a Republican representing a Los Angeles district, had introduced his own bill. He said:

> The trust fund is a logical source of funds for mass transportation projects, since highway users will benefit from the decrease in congestion and traffic which mass transit provides.

Some of the opponents were concerned about "breaking faith" with highway users who paid the taxes that went into the Highway Trust Fund. They were particularly opposed to using the funds for rail transit, and more supportive of highway-oriented transit. They favored general Treasury funding for rail systems.

The Highway Action Coalition was lobbying those leaning toward opposing diversion, with special attention being paid to Representative Delwin M. Clawson, a Republican from Downey in the heart of Los Angeles, who was leaning toward opposing diversion. [Houston, Paul, "Californians in House Divided on Using Highway Funds for Transit," *The Los Angeles Times*, March 19, 1973]

With the fate of the issue now in the House, reporter Mary Russell of *The Washington Post* published a profile of Senator Randolph because he might be the key voice in the conference committee that would likely be needed to reconcile differences in the House and Senate versions of the Federal-Aid Highway Act of 1973. It began with a quote from the Senator:

> "When I first came to the Hill in 1933 I became a member of the House Committee on Roads. Even before that I had envisioned a need for a superhighway system. I was so bold as to draw lines on a map outlining where it would go. Then I introduced legislation. I didn't see it as a process of machines laying concrete and asphalt. I saw it as a process of one part of America getting to know another part of America."

Back then, in the 1940s and 1950s, Russell pointed out, no one challenged the slogan "America on the move" and Randolph "was considered progressive and liberal for his dedication to superhighways." Times had changed:

> Today, in an America beleaguered by air pollution, crowded in cities already congested by traffic and facing the prospect of possible gas rationing this summer, Randolph's views sound a little outdated. He sounds, in fact, like the New Deal liberal he is—a liberal who believes social change can be accomplished by outlays of money for material goods and nonmaterial programs, as opposed to the new breed liberal, who wants to attack institutions he feels are preventing social change.

Randolph may have been "losing ground" but he was "far from fading." If, as expected, the House rejected the use of Federal-aid urban system funds for rail transit as permitted by the Muskie-Baker amendment, Senator Randolph would be "the key to the form the country's transportation policy will take—at least for a while." The expectation ("not much doubt") was that he would concede the House's position on the issue, leaving mass transit to wait until 1976 "for another shot at a slice of the lucrative pie." If so, "Randolph will deserve much of the credit for preserving the trust fund intact."

He was, clearly, a friend of the powerful highway lobbyists. Indeed, Russell pointed out, he had worked for ARBA after leaving the House in 1947 until he joined the Senate immediately after a special election in 1958. A Senate aide pointed out, however, that saying the Senator was "selling out" to the lobby was pointless. "Randolph's past the point where the highway lobby can influence him much more." Being from West Virginia, Randolph understood that roads "don't just mean going from place to place. They mean jobs, and that's the point from which Randolph looks at it."

The Highway Action Coalition's Kramer acknowledged that Senator Randolph was "very good at clubby Senate politics" and using his position on the Public Works Committee to "trade off votes on the highway act." For example, the coalition had expected Senator Magnuson to vote for the Muskie-Baker amendment but instead he agreed to a "live pair" with Senator John C. Stennis (D-Ms.).

(When a member expects to be absent for a vote, he may arrange in advance to be recorded as in favor of, or opposed to, the measure by being "paired" with another member who holds a contrary view but also will be absent. As the 1974 guide to Congress explained, "A specific pair of this kind shows how he would have voted if he had been present." It also ensures that his absence will not be the deciding factor in the outcome of the vote. If one of them unexpectedly is present, he "votes as he would have voted if he had not been paired, and subsequently withdraws his vote and asks to be marked 'present' to protect his colleague." This arrangement is known as a "live pair." [*How Our Laws Are Made*, p. 33])

Russell quoted Kramer as saying:

> Randolph used two tacks. First, he reminded Magnuson he had given him everything he wanted—a dam, fish hatcheries, some roads. Then he said the real issue is "whether I'm chairman of the committee or Muskie is." That got to Magnuson as a fellow chairman.
>
> With (Sen. Howard) Cannon [who voted against the Muskie-Baker amendment], Randolph played the trust fund bit. Cannon's interested in airports, and Randolph told him if they break this trust fund they'll break the airport trust fund. With (Sen. Mike) Gravel, he just gave him the Alaska highway and (Sen. Russell) Long got the toll road he wanted.
>
> Randolph came close, but he failed on this vote because trading off pork just doesn't pay at the ballot box the way it used to. And when an issue gets a lot of coverage and members know their vote is going to be watched, Randolph's kind of politics just doesn't work.

Senator Randolph denied calling in "chits" (favors). "I just never do it. I don't believe in it." Instead, a Republican Senator's anonymous aide said, Senator Randolph was "a courtly Southern mogul of another era, a gentle courtier even when he's pushing you around, and a very hard working sob [sic] who knows his stuff." The aide explained that the Senator's attitude was, "Does anybody want anything? Just let me know." In return, he assumed they would give him what he wanted.

Senator Randolph's politeness had its limits, as Kramer explained:

> "Every time Lowell Weicker comes within 20 feet of Randolph, his jowls start quivering. When Weicker starts in about children dying in school bus accidents and highways for the rich and paving the country with asphalt, Randolph nearly goes into cardiac arrest."

The Senator recognized that times were changing. "I know it is not enough just to think anew; we must act anew." Citing under-utilization of BART as an example, he was convinced that the country, including its urban areas, would need roads for many more years. The cost of rapid rail transit was well beyond the revenue in the Highway Trust Fund. Russell wrote, "He feels the mass transit people should 'get their own trust fund, like the airport people did.'" He added, "I only want the interstate system completed so I can dedicate myself to work in the front ranks of mass transit." As for how long completion of the Interstate System would take, his reply "holds scant comfort for the transit backers: 'About 10 years, maybe longer.'" [Russell, Mary, "Sen. Randolph: Key to Highway Trust Fight," *The Washington Post*, April 16, 1973]

Frank C. Herringer

On December 19, 1972, the White House announced that Alexander P. Butterfield would be nominated to be FAA Administrator. Butterfield, a former Air Force pilot and Deputy Assistant to the President, had served most of the past 4 years in the White House as a deputy to H. R. Haldeman. Butterfield's confirmation would be delayed in February when Senator Magnuson, chairman of the Commerce Committee, explained that the White House had acted "naively" by forwarding the nomination to Congress before Butterfield resigned his "retired" commission as a Colonel in the Air Force. The law establishing the FAA said that the Administrator "at the time of his nomination shall be a civilian." The White House would have to withdraw the nomination and resubmit it.

In two earlier cases, Congress had passed legislation to waive the FAA requirement, most recently President Johnson's nomination of Air Force General William F. McKee in 1965, the only four-star General in the history of the Air Force without a pilot's license. In 1973, the Congress would not consider such a bill, as a Senate aide told the Newhouse News Service. "LBJ was enjoying the zenith of his power in Congress then. The climate in 1973 is vastly different." Further, an aide told *The New York Times*, "Nobody here likes the White House much, and Butterfield is a rather routine career officer who never amounted to much until he latched onto Haldeman. So why make it easier for them to stuff another crony into another agency?" [Newhouse News Service, "Hitch Delays FAA Nominee," *Washington Star-News*, February 16, 1973; Apple, R. W., Jr., "Nominee to F.A.A. Quits Air Force, *The New York Times*, February 27, 1973]

After Butterfield resigned from the Air Force (at a cost of $10,000 a year), the White House resubmitted the nomination. The Senate confirmed Butterfield who served as FAA Administrator from March 14, 1973 to March 31, 1975.

Also on December 19, 1972, the White House announced the appointment of Frank C. Herringer to be UMTA Administrator. Herringer was born in 1942 in New York City and raised in Seaford on Long Island. He graduated Phi Beta Kappa from Dartmouth College, having majored in mathematics and economics. He joined the international management consulting firm of Cresap, McCormick and Paget, Inc., in 1965 and remained there until joining the White House in November 1971 as a deputy to Frederick V. Malek, the President's advisor on personnel matters. As Professor Lee noted, Malek was "the White House staffer in charge of appointing loyalists to positions in the departments and agencies for the second term . . . ." before moving to OMB as Deputy Director. [Lee, p. 99]

The Senate Committee on Banking, Housing and Urban Affairs held a confirmation hearing for Herringer on January 26, 1973, with Chairman Sparkman presiding. The nominee did not make an opening statement. Senator Proxmire began the questioning by pointing out that Herringer's biographical sketch did not include any experience in the field of transportation or mass transportation or work related to mass transportation. "Were there other opportunities you had to develop any understanding or experience in the area of transportation?" Herringer had to admit, "No, sir; there were not."

Senator Proximire explained that, "I am concerned about the administration's tendency to appoint very bright people—you are extraordinarily young—who have no experience at all in the field in which they are moving . . . ." Although the Senator was certain Herringer was "a very quick learner," he wondered "if it is logical to appoint nonexperts in all these areas." He mentioned the appointment of James Lynn to be Secretary of Housing and Urban Development as another example.

Herringer responded that UMTA had many experts who knew the technical details of the field. "I think what I bring to the task are management skills, as my record attests."

Nevertheless, Senator Proxmire was concerned that someone with so little expertise would head a billion dollar agency when the Administration may be thinking about making sharp reductions. "If the man in charge doesn't have a feeling in his heart and in his stomach about the need for the program, it seems the program could be crushed, before you get to develop that kind of sensitivity and understanding of what is needed."

Herringer said "it is my understanding that this is not an area in which there are great cuts to be made." Further, in his review of the field since the nomination, he had come to very few conclusions but one "I can state without a shred of doubt: this has to be one of the most exciting, the most challenging fields in or out of Government." He planned to thoroughly review UMTA's demonstration programs and its research and development activities "to insure that the money is being spent on projects which have a real benefit, that appeal to the needs of the consumer, and that somehow advance the technology of urban mass transportation." He also planned to address the long-range objective for the major cities. "It seems that much of the work has been ad hoc, such as in response to a grant request. I hope to push out in that direction."

Senator Proxmire pointed out that "the heart of this problem is that our highway trust fund has resulted in providing a steady growing source of funds for building highways." He asked Herringer how he felt about transferring Highway Trust Fund revenue to mass transit. He called Administrator Villarreal "a champion" of diversion. Herringer said he would have supported the Cooper-Muskie amendment had he been in office in 1972, but "beyond that, I really do not know the answer . . . ." Given the need to complete the Interstate System and improve other highways, "that decision would have to involve people far beyond the Urban Mass Transportation Administration."

Seeing Senator Weicker on the panel, Senator Proxmire asked about the Kennedy-Weicker amendment from 1972. (At this point, Senators Kennedy and Weicker had not yet introduced their 1973 amendment.) Herringer was hesitant to take a position because of the broad scope of the amendment. "I do not think from that perspective I can by myself make a determination of whether those dollars should be transferred around." The FHWA Administrator, the Secretary of Transportation and others "with a perspective that encompasses all of the aspects of the problem" would have to be involved. He would say only that he would determine how much money should be spent on urban mass transportation and then "work with the Secretary and with others to develop the funding, especially where it concerns transferring money from one program to another."

Senator Proxmire concluded by saying:

> One way of holding down very expensive programs is to divert money from the highway trust fund into mass transit. Very painful to the highway people, but very logical from the standpoint of some of us who want to get as much as we can out of a very limited budget . . . . The best way to make a priority is the way the highway program became a priority, and that is to give it a funding [source] that is protected, insured, and growing. [*Nomination of Frank C. Herringer*, Hearing, Committee on Banking, Housing and Urban Affairs, United States Senate, 93rd Congress, 1st Session, 90-185, January 26, 1973, p. 1-6]

Senator Weicker asked if Herringer supported the concept of diversion. He did. Senator Weicker also wanted to confirm that aside from diverted Highway Trust Fund revenue, Herringer supported separate funding for mass transit. He did. If funds were diverted, would that reduce funding from other sources? Herringer said he had no way to answer the question.

Senator Biden had not been in the Senate in 1972, but said he understood that Secretary Volpe had been a strong advocate for opening up the Highway Trust Fund. Would Herringer be as strong an advocate? "Well, Senator, people who know me would be very quick to say that I am not a passive individual." Advocacy would be needed. [*Nomination of Frank C. Herringer*, p. 7-9]

On a second round of questions, Senator Biden asked if Herringer would support Federal funds for operating subsidies. Herringer had studied the issue, but still had some questions, such as:

> [How] do you do this without throwing money down this tunnel forever? How do you motivate management to hold down labor costs, how do you insure equitable treatment from one city to another, particularly since transit systems do not have common accounting systems, fares are at different levels vis-à-vis expenses; and some cites, like Atlanta, have a sales tax to subsidize their mass transit, while someplace else does not. [sic]

He worried that once started, subsidies would become a long-term commitment. He wanted to study the issue further. As an alternative, local subsidies were an option. "Hopefully through the capital grants program and through improved management of the transit operating companies, we can also reduce the problem from the serious level where it is now, I believe about $450 million a year."

Senator Biden, having just come from local government, mentioned their financial straits. He added, "I would hope that you would not rely too much on the local municipalities and State governments to begin to solve the problem." He agreed that a long-term plan was vital, but "the Congress has been so reluctant to formulate such a plan that if we wait until the plan is formulated, everything else may come to a screeching halt in terms of mass transportation." [*Nomination of Frank C. Herringer*, p. 10-14]

The committee approved his nomination on January 26 and the Senate confirmed him without debate on January 31 along with other nominees, including James T. Lynn as Secretary of Housing and Urban Development.

Shortly after 31-year old Herringer took office, *Business Week* told its readers that his nomination had "startled many Washington observers." The article explained:

> Other than the fact that his father is a signal maintenance man on the New York City subway, Herringer has virtually no transportation experience. As part of the Administration team that must race to fashion legislation allowing cities to use highway funds for mass transit, Herringer will step from obscurity into the Capitol Hill equivalent of a barroom brawl.
>
> Last year, an Administration-backed proposal to tap $800-million of the heretofore inviolate $5-billion Highway Trust Fund for urban mass tranit sparked a bitter battle, pitting environmentalists and urban-oriented rapid transit forces against the powerful coalition of roadbuilders, oil companies, and motor carriers that make up the highway lobby.

Now, even with the States running out of highway funds, "neither mass-transit nor highway forces [are] showing any willingness to compromise." It would be a stern test for the new Administrator:

> Characteristically, Herringer dismisses the problem with the insouciance of a young man accustomed to victories. The highway battle will be a tough fight, he concedes. "But I'll have some help," Herringer smiles. "Last year, we just ran out of time."

That battle aside, Herringer will find "problems aplenty" at UMTA, not least being "surrounded by the outstretched hands of big-city mayors, who must combat increasing congestion and air pollution problems with crumbling, debt-ridden transit systems." In addition, he wanted to examine UMTA's priorities:

> One of the first tasks ahead of Herringer will be establishing a clear order of priorities for UMTA, which has been dispensing its grants both to bus systems and to the more expensive rail systems. "My principal responsibility will be to determine how much money we should be spending on urban mass transit," he says. "I [also] want to take a hard look at all our R&D, to make sure it is wanted and needed by our consumers. My training and whole outlook say, 'Let's get a sense of the long-range plan, then make sure everything we do is compatible with it.' And I get the feeling that everything that is going on at UMTA is a response to events of the day."

Herringer's White House boss, Malek, had a reputation as a strong partisan ("a hard-nosed hatchet man") not only for the reelection of the President but the plan to disperse Nixon loyalists to Federal agencies to thwart independent agency heads and bureaucratic obstruction. Herringer denied having any role in Malek's partisan activities. His job had been "placing people in slots." He told *Business Week*, "I've never gone to an Under Secretary's office and told him to clear out by 5 o'clock. And I wouldn't characterize myself as a housecleaner or hatchet man." He planned to be more concerned with, as the article put it, "seeing that commuter trains—rather than heads—manage to roll." Herringer said, "I plan to be very accessible, especially now that I'm trying to get the total picture at UMTA. I want to get to the cities and see mass transit first-hand, and I plan to meet with industry."

The article concluded:

> Herringer, who lives with his wife in Fairfax, Va., is embarrassingly forced to reflect on the urban dilemma every morning from behind the wheel of his car. "Yes, I drive to work," he admits. "I hate it, but it's indicative of our transit situation." ["His Job: To Push Urban Transit," *Business Week*, February 17, 1973]

Urban Mass Transportation Act Hearing

On March 21 and 22, the House Subcommittee on Urban Mass Transportation, Committee on Banking and Currency, held a hearing to consider the Urban Mass Transportation Assistance Act of 1973. Representative Joseph G. Minish (D-NJ), a former labor organizer and long time resident of West Orange in northeastern New Jersey, was the chairman. He explained that the committee had established this subcommittee "to highlight the importance with which we as members of the Banking and Currency Committee view the whole matter of urban mass transportation."

The hearing, the new subcommittee's first, was being held to consider several mass transportation bills. Representative Minish had introduced the Urban Mass Transportation Assistance Act of 1973 (H.R. 5424) containing the transit provisions from "last year's housing bill which the House never had an opportunity to consider." The act included $400,000 a year for operating subsidies, a $3-

billion increase in UMTA grant funds, and a prohibition on grants for school buses. The hearing also would consider the Administration's proposals to amend the Urban Mass Transportation Act of 1964. The Administration bill (H.R. 5919) included the $3-billion increase, changed the Federal share to 70 percent, funded a training program "to provide fellowships for training of personnel employed in managerial, technical, and professional positions in the urban mass transportation field," and several technical amendments. [*Urban Mass Transportation Assistance Act of 1973*, Hearings on H.R. 5424 and H.R. 5919, Subcommittee on Urban Mass Transportation, Committee on Banking and Currency, House of Representatives, Committee Print 93-384, March 21 and 22, 1973, p. 1-5)

The first witness on March 21 was Dr. Ronan. He complimented the committee on the creation of the new subcommittee, which he was sure would result in "a greater congressional commitment to the proposition that improving the health of our metropolitan regions and their urban public transportation systems is indispensable to the national interest." He supported the Administration's proposed increase in UMTA funds for capital grants and recommended increasing the Federal share to at least 80 percent, rather than 70 percent as Secretary Brinegar had proposed. He supported S. 502, the Federal-Aid Highway Act of 1973, with its transit provisions.

Transit systems across the country were making "heroic efforts" to help urban public transportation systems pay their operating and maintenance expenses. "The day is past for expecting local transit systems to be able to operate out of the farebox." The Federal Government "can and must play a role in helping to stabilize transit finances." He supported the Minish bill and S. 502 and said he was "greatly encouraged by the widespread support which these bills have garnered for this is indicative of a national awareness that the Federal interest is well served by their intent."

He acknowledged that "roughly one-third" of the funds from the Minish bill for operating subsidies would go to the tri-State area surrounding New York City, including Minish's New Jersey, but said:

> If we look at it, realistically, I think a more modern approach as meeting a regional need wherever that may be is indicated. In some parts of the country, a metropolitan region is totally within one State and in other areas it may be an interstate region. In the New York area and some other areas, we have tristate metropolitan regions. We really ought to look at it in this way.
>
> Now, I would also observe that many other areas of Federal assistance do not have a limitation based on State boundaries. In other words, the aid to agriculture is not limited to a certain percentage of people within the State or farm communities within the State.

Dr. Ronan also endorsed the Muskie-Baker amendment in S. 502 because it made "meaningful sums of moneys" available that State and local communities could use for "projects involving rail transit, buses, new technology, or highways—which best suits local needs at local option." *Urban Mass Transportation Assistance Act of 1973*, p. 7-9]

Carmack Cochran addressed the committee on behalf of the American Transit Association. He appreciated the important steps taken since passage of the Urban Mass Transportation Assistance

Act of 1970, but now, he said, "is the time to reassess, to reevaluate, and to reorder priorities." The foremost goal "must be the guaranteed financial stability of urban transportation." The debate over operating subsidies was now in its third year, with the delay signifying "that there is an unlimited capacity [on] the part of the money spenders to think up new reasons for not making good on a broad commitment to transit." The industry should be thought of as a "public service" since anyone thinking of investing in it "would be better advised to speculate elsewhere." Only the Federal Government had the resources to provide the needed assistance.

He addressed some of the arguments against Federal operating subsidies, including the idea that it would to be "a case of pouring public funds down a rathole." He argued that subsidies "can indeed breed incentives, improve service, lower fares, reduce the number of automobiles congesting our streets and polluting the air." Atlanta, he said, was an example of how subsidies can increase ridership.

To those who say that localities can use General Revenue Sharing for operating subsidies, he replied that a survey of 1,000 transit systems revealed that only five cities had used the funds for this purpose (Detroit, Little Rock, New York, Terre Haute, and Wichita). A major reason was that "only 25 percent of all the publicly owned transit systems are within city departments supported by funds from the regular city budget, and are thereby the beneficiaries of General Revenue Sharing payments." Further, many localities simply choose to use the funds on other activities.

"A Federal program, then, is needed to assist the cities in continuing present service innovations and to provide the incentive to other cities to institute public transit programs." Time was of the essence. "Fares across the country are breaking the 50-cent barrier and the reaction of the riding public is predictable. Those that can, will ride, one to a car, and jam our downtown parking and highways even more." [*Urban Mass Transportation Assistance Act of 1973*, p. 26-29]

ARBA's Daniel J. Hanson also testified. Although ARBA was primarily an association of road contractors, its constitution cited "other forms of transportation facilities, including urban mass transportation vehicles." He said that Federal grants were more effective when "directed toward clearly defined objectives." Federal-aid highway funds met this goal by being restricted to capital improvements, not for maintenance or operation. Given the needs in this area, ARBA supported increasing the Federal share from the traditional 50 percent to 70 percent for Federal-aid highway projects and supported the increase to 80 percent for mass transit projects under Chairman Minish's bill.

He strongly supported Federal-aid highway funding for highway-oriented transit activities, but "we are opposed to the use of highway funds for the purchase of equipment, either buses or rail transit vehicles, and for the construction of such facilities." He explained:

> We believe that there is a principle involved and that the Federal aid program should be clearly defined in structure and in meaning and [that] overlapping and duplication of programs should be avoided. Under the terms of the Senate bill, local transportation authorities would, I am sure, go shopping around for the best buy in Federal urban mass transportation grants.

> The advantages of using the so-called title II urban mass transit funds [the Emergency Commuter Relief Act] would be considered against other provisions for financing from the Federal level. I think this is the precise kind of problem that has confronted us in the past in regard to overlapping and receipt of complaints from local officials.

He encouraged consideration of a trust fund for transit to put it on the same footing as highways and airports. [*Urban Mass Transportation Assistance Act of 1973*, p. 74-76]

Baltimore's Mayor Schaefer appeared on behalf of the National League of Cities and the U.S. Conference of Mayors. "It is our position that the preservation of public transportation in our cities cannot be met solely by State and local financial resources, but requires a substantial commitment from the Federal Government." The additional assistance for capital grants was vitally needed. The proposed Federal-State matching ratio of 80-20 should be mandatory instead of discretionary.

He also stressed the importance of the proposed operating subsidy of $800 million over 2 years. "At present, transit fares have reached that point in a geometric progression where each new mandated rise and concurrent service cut will drive away more and more riders." His own city of Baltimore had been operating its transit system in the black but was about to slip into the red. Cities had many needs and limited budgets. "We are being innovative and creative, but our resources are clearly limited. Moreover, we cannot stretch revenue sharing to cover everything."

Baltimore, he said, was a rebuilding city with a strong commitment to mass transit. It must be adequately financed. "To partially finance it places us in a position where we accomplish little." An analysis of ridership around the country made clear that:

> If we do not have the subsidy, the rate continues to increase to a point where it is impossible for people . . . they can't pay the fare, then we are defeating our purpose. So in addition to having adequate funding for capital programs we must have the operating assistance to keep the fare within reason. [*Urban Mass Transportation Assistance Act of 1973*, p. 132-134]

Commissioner Schuler of the New York testified that "there is almost universal agreement [that] operating assistance is an absolute requirement for the continuation of what public transit we have." What was at issue was the role of the Federal Government, which traditionally shied away from operating subsidies "which may turn into 'rat holes.'" He argued in favor of Federal assistance:

> If, indeed, it was proposed to simply make up transit operating losses, the "rat hole" argument would be valid. But if ridership is the key, if the program builds in incentives for better service, increased ridership, and equitable fares we can have a positive program . . . . I believe a case can be made for Federal operating assistance for urban public transportation on the basis of its role in helping urban centers maintain economic health, which in turn affect [sic] the health of the Nation. If price-support programs to maintain the well-being of farmers are in the national interest, operating support for urban transit is also in the national interest. [*Urban Mass Transportation Assistance Act of 1973*, p. 147]

On March 22, UMTA Administrator Herringer was the first witness. He began by summarizing the mass transit provisions of the bill Secretary Brinegar had released on February 21:

> First, to increase the authorization to incur obligations from $3.1 billion to $6.1 billion . . . . Second, the administration recommends increasing the maximum Federal share of capital grants and technical studies from two-thirds of the project's cost to 70 percent of project costs . . . .
>
> In addition to increasing the authorization and the Federal share, the administration's proposed bill would clarify the scope of technical study activities and eliminate restrictions on the number and type of managerial training grants, making the program a much more effective tool for improving the management and operation of mass transportation.

He also commented on the bill Representative Minish had introduced. Under H.R. 5424, the Secretary would be able to make grants or loans of $400 million a year for 2 years for operating costs provided the applicant submitted and the Secretary approved a comprehensive mass transportation capital and service improvement plan. Herringer did not question the seriousness of the struggle to cope with rising costs but could not "accept that the proper Federal role is to provide operating subsidies." He explained:

> The dilemma we are faced with is that on the one hand for the Federal Government to allocate operating subsidies without setting standards and controls would provide absolutely no assurance that the moneys were being used effectively—while on the other hand to establish controls and standards at the Federal level would require that we involve ourselves in making local decisions that we are not competent to make.

For example, H.R. 5424 would require the Secretary to determine whether a local plan would provide efficient, economical, and convenient mass transportation service and would place operations on a sound financial basis. Such a determination "would immerse the Federal Government in myriad local issues relating to such matters as fare levels and fare structures, maintenance standards, management practices, labor work rules and practices, and the like." Even with an expanded bureaucracy, UMTA "would not be in a position to make these local tradeoffs for each and every system," which he estimated totaled between 500 and 1,000. "Who are we," he asked, "to tell New York City or Boston or any other city what fare it should charge?"

Adding the Federal Government to the determination of fares, routes, wages, and other characteristics "will not provide answers." Instead, he said:

> In fact, it may allow local authorities to avoid taking the tough, non-monetary steps, such as traffic regulations, pricing of parking facilities, and the like, which are absolutely essential. Instead, what we will probably be faced with is a continually accelerating demand for greater and greater subsidies, without producing real improvements. [*Urban Mass Transportation Assistance Act of 1973*, p. 89-91]

The questions for Herringer covered many aspects of UMTA's programs but some focused on the key issues raised during consideration of the highway legislation. Representative Koch said he was "really sorry" that Herringer had opposed operating subsidies. "It is hard for me to really understand that." He asked if Herringer agreed that "you simply cannot pay the cost of operating the subways and the commuter lines out of the fare box." Herringer could not say that. "I would say that many cities have decided that the priority is to lower fares and, therefore, incur an operating deficit for the purpose of getting more people on mass transit."

Regarding the concern about having to establish a bureaucracy, Koch said that would not be needed, at least under the bill passed in 1972: "That bill provided in its formula that a mass transit facility would receive a subsidy based on the number of fare passengers carried." This would establish a competition among the systems. "Isn't the competitive aspect there something you want to encourage to upgrade mass transit?"

Herringer explained that the bill provided for a formula allocation of funds, but only after the local body had submitted a plan and the Secretary approved it as putting the system "on a sound financial basis, whatever that means." He continued:

> We would have to get in and evaluate this plan. How are we going to decide whether New York and Atlanta will be on a sound financial basis? What does that mean? Does that mean because New York's labor costs may be 80 percent and Atlanta's may be 60 percent, that one is and one is not on a sound financial basis? There are many problems.

Representative Koch said that "with all of the talent" in UMTA, he was confident it could make such evaluations. Herringer replied, "I appreciate your confidence in the Urban Mass Transportation Administration, but I don't think we are competent to do that." [*Urban Mass Transportation Assistance Act of 1973*, p. 103-104]

Representative Steward B. McKinney (R-Ct.) also wanted to talk about operating subsidies. He encouraged Herringer to read a book called *Is Your Volkswagen a Sex Symbol?* (Jean Rosenbaum, M.D., Hawthorn Books, 1972). He summarized the book as saying:

> The American people are in love with the automobile. The love affair is beginning to cool quickly. They don't run, they don't get any gas mileage, gasoline is going to increase in cost dramatically, probably double or triple over the next 10 years, people are going to find out it costs more to drive their car to work than it does to get there by any other means.

The alternative is just as bad. "We have insulted the America people with public transportation over the last 30 years that anyone with an ounce of dignity finds it very difficult to find an excuse to ride on it." To get people out of their cars, "you have got to have a system that is running and sustaining its cost and educate people slowly to the fact that, gee it is going to run on time, my goodness the air conditioning does work. Gee, it doesn't take any longer now than it did in 1947." He asked how Herringer would feel about a subsidy limited to 3 years "to educate your people to let them know that, yes, you do have a system that works."

As a daily commuter for 3 years on the New Haven Railroad, Herringer said he understood the problems Representative McKinney was describing in Connecticut. He could not, however, support a temporary subsidy. One problem was that he did not believe the subsidy would be temporary. "I think the pressures would be such it would be very hard to limit it to 2 years or 3 years because everyone would be back asking for more in 2 or 3 years." Further, what guarantee was there that during the temporary period, urban mass transportation would improve to the extent that it would convince people to use it instead of their automobiles? He pointed out that some localities had put a surtax on gasoline to pay for mass transportation, citing Atlanta and California.

(A few years earlier, journalist Anthony Bailey had offered this faint praise for the New Haven Railroad:

> [The] poor railroad's passenger traffic problems are so tediously familiar that one is liable to forget that even the New Haven Railroad in its present bankrupt state, carries passengers to the towns on its tracks as fast as a car. Moreover, despite its extravagantly over- or underheated cars; its dry, overpriced sandwiches; its wet, overpriced omelettes; its dusty, collapsing seats; and thermopane windows turned into seasick-inducing chambers by a rock that has been thrown by a vandal and a railroad-carwashing machine which half filled the window with water—despite all this it sometimes allows one to read, eat, or sleep en route. [Bailey, Anthony, *Through the Great City*, The Macmillan Company, 1967, p. 13-14])

Representative McKinney pointed out that such a tax might work for a city, but in a megalopolis such as Washington, with its ties to Maryland and Virginia, or Connecticut with its links to New York City, "we have a tough time just deciding on what color upholstery is going to go in the cars," yet alone how to increase revenue. Herringer pointed out that:

> The institutional problems are great and are a whole different set of problems from the operating subsidy problem. You would still have the institutional problems with an operating subsidy. [*Urban Mass Transportation Assistance Act of 1973*, p. 105-106]

(Dr. Rosenbaum's book explored the psychological forces that cause people to select a car, pet, home, and other items. The chapter on the automobile began:

> Instead of the eagle, the national symbol of the United States should be the automobile, for the nation has become the land of pistons and the home of horsepower.

(She attributed the success of the automobile to several factors. For example:

> The automobile is the number-one answer for the lazy man who lives within nearly all of us. This lazy man, who has little or no regard for the muscular or motor functions of the body, is the reason we continually look for easier ways of doing things. The automobile not only has catered to that laziness but in some ways has strengthened it.

(The automobile also is a symbol. "Owning and driving a car are a sign of adulthood, though not necessarily a sign of mature and responsible adulthood."

(Dr. Rosenbaum assigned "the biggest psychological basis and compensation for owning an automobile" to the fact that "the automobile has become an extension of the individual personality." She continued, "It has become the means by which man is able to actively express his wishes for power and mastery over nature." Beyond those factors, she called the automobile "the most common sex symbol in our modern society. It is identified with sexual ability and physical sexual characteristics."

(These forces played out in our choice of automobile. "There are psychological reasons for choosing the automobile you do, and your choice of car may reflect exhibitionism, inferiority, family loyalty, delusions of grandeur, and other personality traits." Gender and marital status also affected selection. Women, Dr. Rosenbaum said, are more interested in style, color, consumer ratings, and convenience of handling than men:

> They also make inquiries about the performance of an automobile from relatives, friends, and the salesman. They are more willing to be guided in their selection. Women are probably shrewder buyers because they are less swayed by horsepower and nonessential accessories. They are accustomed to bargain hunting and are interested in getting the most for their money.

(As for the Volkswagen cited in the title, Dr. Rosenbaum says that its buyers were a special group:

> When you buy a Volkswagen, you don't just get a car; you also acquire a lot of friends—other Volkswagen owners. The Volkswagen is a way of life. More than that, it is a declaration of a certain attitude toward life and society. The Volkswagen owner is saying that he is concerned about economics, air pollution, and good craftsmanship. Volkswagen owners include students, professional people, and executives as well as a large number of older retired persons who appreciate economy and ease of handling. Creativity marks the Volkswagen owners. They usually take an intellectual and rational view of life. They are individualists. A Volkswagen owner is almost fiercely loyal to his "bug" and does not harbor secret wishes to own a Cadillac, a Thunderbird, or a Continental.

(She acknowledged another personality trait:

> Although it is difficult to ignore the automobile, some people try to and do, to an extent, succeed in organizing their life-style in at least a semi-nonautomotive pattern . . . . Because of the psychological and sociological implications surrounding them, automobiles have become particular objects of disdain.
>
> It has even become the "in" thing among some intellectuals to adopt a pseudoprimitivism and denigrate the place of automobiles in modern life. There is a big scrap heap in these people's minds to which they consign automobiles, television sets, and elaborate and (to them) unnecessary household appliances and gadgets.

(These people aside, "no subculture has been so strong or exerted so much influence as the automobile subculture." As she explained in the chapter's conclusion:

> Air pollution problems may cause technical and mechanical modifications to be made in automobiles, and restrictions may be placed on when and where they may be driven, but the automobile as a symbol of aggression and sexual power will only be challenged when our society itself and our social structure are changed. [Rosenbaum, p. 1-26])

Representative Andrew Young (D-Ga.), an African-American who had emerged from the civil rights movement and was serving his first term in the House, began by saying, "I am so glad to see that there is at least something that comes from this administration that I can wholeheartedly say amen to and I was very pleased with your presentation . . . ." He continued:

> [I] would just like to say that our experience in Atlanta has been that not only does mass transit provide transportation but it really has provided an economical boom for the entire metropolitan area. When UMTA committed itself to a billion, when we together committed ourselves to $1,400,000,000 for a transportation system, what we found in the first year after that commitment was that there was almost $4 billion of private sector money committed to the central city area, and I can see this program as the basis of saving metropolitan America . . . . I think the viability of our cities pretty nearly revolves around our ability to solve the transportation problems.

He asked, "let me understand that you don't have any problem with Atlanta, say, subsidizing, providing an operating subsidy as part of its local share?" He explained that a sales tax was the basis for the subsidy. Herringer clarified that:

> No, the operating subsidy is separate, we require right now one-third local share on our capital grants. That is a straight local contribution to the capital cost of the project. Operating subsidy provided locally is separate and in addition to that.

Representative Young said he had not realized the distinction. He pointed out that he and his Atlanta constituents were concerned "that the opening of the trust fund might mean that there would be a tendency not to fund the UMTA Act to the full extent . . . ." Herringer reassured him by saying "that is one of the reasons why we are strongly pushing the extra $3 billion in contract authority to assume [sic] the cities that we are not considering this flexibility in the urban system fund as a substitute for the UMTA capital grant program." [*Urban Mass Transportation Assistance Act of 1973*, p. 107]

(The Metropolitan Atlanta Rapid Transportation Authority (MARTA) was developing a 48-mile rail transit system financed by a 1-percent sales tax. The referendum approving the sales tax increase was accepted by African-Americans in the city in return for a pledge to operate the system as a subsidized public service, like a police or fire department, and to keep fares low rather than on a pay-as-you-go basis. In February 1972, MARTA purchased the area's primary bus company, which served mostly African-Americans, and promptly reduced fares from 40 cents to 15 cents a ride. Ridership increased by 21 percent in the first year, during which the buses carried 11.5 million more passengers than in the previous year. This immediate impact of the decrease in fare caught the attention of transit supporters around the country. Construction of the MARTA rail system began in 1975, with the first segment opening on June 30, 1979. ["MARTA's Past and

Future," Metropolitan Atlanta Rapid Transportation Authority, http://www.itsmarta.com/marta-past-and-future.aspx]

(Voters in Fulton County, which includes Atlanta, and DeKalb County approved the referendum, but voters in Clayton and Gwinnett Counties turned it down in an apparent attempt to preserve their suburbs for white residents in an era when open housing laws were still controversial and school busing demands had helped fuel "white flight" out of Atlanta. The failure to extend MARTA into these suburban areas reduced its effectiveness as a solution to regional transportation problems. [Allen, Frederick, *Atlanta Rising: The Invention of an International City 1946-1996*, Longstreet Press, Inc., 1996, p. 224-226])

Representative John Joseph Moakley (D-Ma.), who was a lawyer, former State legislator, and member of the Boston City Council serving his first term in the House, said that Herringer's opposition to subsidies "bothers me just a little bit," as it had Representative Koch. Providing capital grants to build and improve urban mass transportation but not operating subsidies was "like putting a person in business and saying we are not going to give you any capital to operate with." He wondered if Herringer opposed operating subsidies because a bill authorizing them could not be approved. Herringer assured him that the practical political consideration was not a factor. The Nixon Administration opposed operating subsidies "because we just do not feel that that is a proper Federal role." He emphasized that he did not quarrel with State or local governments that decide to operate the systems with a deficit to keep fares low enough to attract more riders. "But what we are saying is the Federal Government is not the proper subsidizing organization for all of the reasons that I have mentioned."

As for the analogy offered by Representative Moakley, Herringer responded "that we don't give people the buses or the trains without being assured by them, as part of our capital grant guidelines system, that the funding is there to support the operations of that system for a 5- or 10-year period." The systems have assured UMTA that if a deficit occurs, they will be covered. [*Urban Mass Transportation Assistance Act of 1973*, p. 108-109]

Representative Tom S. Gettys (R-SC) asked Herringer if diverting Highway Trust Fund revenue to mass transportation was a "violation" of trust? Herringer replied, "I certainly support the administration position of flexibility in the urban systems portion of the highway trust fund." But, Representative Gettys asked, was there "any moral obligation for us to abide by what appears to be sort of a contract with the American people in the highway trust fund?" Herringer pointed out that highway user taxes existed prior to 1956 when the decision was made to dedicate them to the highway program. In recent years, "we have seen the fund gradually being expanded, the use of funds being expanded to include parking lots, exclusive bus lanes, and even one ferryboat has been purchased under the fund." He concluded that diversion would be seen "not as a violation of the fund, but as a natural extension of the evolution of the fund to meet the needs of today."

> Mr. Gettys. You feel that that is a proper approach to obtaining money for the mass transit conception rather than getting a new source of funds.
> Mr. Herringer. Well—
> Mr. Gettys. Just out of the general treasury, maybe.

> Mr. Herringer. Mr. Gettys, we are not, as I understand the provision, we are not getting additional funds for mass transportation. All we are doing is allowing the cities to decide whether they wish to use that portion, that 20 percent of the highway trust fund which is apportioned for use in urbanized areas for mass transportation or for highways.
> Mr. Gettys. Then, in other words, you are not giving more money or less money, it is going to be a local determination as to the use of the money.
> Mr. Herringer. That is correct. [*Urban Mass Transportation Assistance Act of 1973*, p. 110]

Representative Minish asked Herringer about a statement by Secretary Volpe in the 1972 National Transportation Needs report saying that the Department supported making revenue available to State and local governments "for general public purposes or for the general transportation purposes, including operating subsidies . . . ." Herringer pointed out that the statement was in reference to General Revenue Sharing, which could be used for operating subsidies or any other purpose at the discretion of State or local officials. He thought perhaps it also was referring to Special Revenue Sharing for Transportation, but that bill had not "progressed very far in Congress." Representative Minish was not satisfied with the answer, but said:

> It is kind of stretching it a little but I can't argued [sic] with what you want to say. Let me say this. You are the only one of 11 witnesses that appeared here yesterday who opposed it and you probably will be the last. [*Urban Mass Transportation Assistance Act of 1973*, p. 111]

Representative Garry Brown (R-Mi.) asked if the revenue from the Highway Trust Fund went entirely for capital improvements, not operating subsidies. Herringer agreed. Did the Federal Government once subsidize operational expenses of the airlines and still subsidized commuter airlines? Herringer confessed he was not an expert on all operating subsidies, but he believed that Representative Brown was correct. Was funding under the Urban Mass Transportation Act restricted to capital projects? "That I do know."

Admitting that he was "jumping around," Representative Brown turned to Special Revenue Sharing for Transportation:

> Mr. Brown. If you fold those all together, which are all capital moneys, how do you come out under special transportation revenue sharing with operating expenses?
> Mr. Herringer. I am not familiar with the specific provisions of the special transportation revenue sharing proposal.
> Mr. Brown. Let me ask you. Is the administration still considering the special revenue transportation package?
> Mr. Herringer. I don't think so. As I understand it, after we proposed it, it didn't really get very far in Congress and we have pursued other avenues since then.

After once again asking Herringer to confirm that he opposed Federal funds for operating subsidies, Representative Brown concluded his questioning. [*Urban Mass Transportation Assistance Act of 1973*, p. 111-112]

Representative Koch used his next turn to ask about the philosophy of whether the Federal Government should be involved in operating subsidies. He asked if that philosophy applied only to transit or was it a "general philosophical approach that you draw distinctions that operating subsidies are evil and capital subsidies are angelic?" Herringer would not phrase it that way, but said "that as a general philosophical tenet of this administration we believe in a minimum of interference by the Federal Government in local matters and operating subsidies of transit would require us to get involved in local matters therefore, we oppose operating subsidies."

Koch pointed out that the Federal Government provides subsidies to farms not to operate and for low-income housing. "Do you find a problem with that?" Herringer replied that sometimes, "perhaps subsidies are the only way to handle the problem."

Koch pursued this line of argument:

> It seems to me that the automobile owner gets a double subsidy, that is, the subsidy from the highway trust fund and the subsidy he receives at the end of the year by deducting the gasoline tax from his tax return and the interest paid on his automobile loan. Isn't that a subsidy that I as a nonautomobile-owning citizen of this country am in fact paying? Do you object to that?

Herringer replied that, "I certainly don't want to be put in the position of defending the automobile." He continued:

> I think that we have given the automobile a great deal of freedom in this country and it is about time we started rearranging our priorities. In terms of the specifics you just mentioned, I would have to think about it. The automobile owner is paying a tax once on his gasoline and he is deducting that tax as we all deduct taxes for real estate and other local taxes. So perhaps that is not a good example of a subsidy of the automobile owner.

Representative Koch's question time expired. [*Urban Mass Transportation Assistance Act of 1973*, p. 113-114]

Representative McKinney wanted to return to his idea of a temporary subsidy. "What if we were to have a 3-year subsidy program for new transit systems which would say that the Federal Government would pay 75 percent of the deficit the first year, 50 percent of the deficit the second year, 25 percent of the deficit the third year, and that is it." By then, he reasoned, "local enthusiasm" for the system would give it the "political clout" to have the local government provide the subsidy if still needed. Citing the example of Atlanta, Herringer responded that, "If more local areas would have the foresight and would understand . . . what mass transportation could bring to their area, they themselves would make it a priority."

Representative McKinney replied that Atlanta was "an enormous area," in contrast with his hometown of Bridgeport, Connecticut, which was just one town among many. The issue was not that simplistic because "you can't run the buses to the edge of Bridgeport and stop." That was, Herringer said, where the State role comes in. He cited the example of California, which "has passed an increase in the tax on gasoline which goes solely to supporting mass transportation." [*Urban Mass Transportation Assistance Act of 1973*, p. 114-115]

(On February 12, 1973, Representative Koch, age 48, had announced that he would seek the Democratic nomination for Mayor of New York City, with crime as the number one issue. At a news conference in the Hotel Biltmore, he declared, "Overriding all is the paramount problem of crime—crime on our streets, crime in our schools, crime within our government." He called for mandatory jail terms for those who committed violent crimes. "I believe that people who are convicted of violent crime have got to go to jail and if they happen to be drug addicts, you treat their addiction but you treat it in jail, not in neighborhood clinics from which 7,000 addicts are missing."

(His tough-on-crime tactics alienated his liberal supporters without gaining support from conservatives. On March 28, he announced he was abandoning the race, having had difficulty raising campaign funds. [Lynn, Frank, "Koch Enters Race for Mayor; Declares Crime is Main Issue," *The New York Times*, February 13, 1973; Carroll, Maurice, "Koch Abandons Mayoral Race, Citing Trouble in Raising Funds," *The New York Times*, March 29, 1973] City Comptroller Abraham D. Beame would win the nomination and general election, becoming Mayor on January 1, 1974.)

The Senate's Highway Safety Act of 1973

Senator Bentsen introduced the Highway Safety Act of 1973, S. 893, on February 19 "to continue the efforts of the Federal Government to reduce the continuing death and injury that takes place on our country's roads." He had decided to introduce the measure separately from the Federal-Aid Highway Act because "I believe that highway safety requires the separate and undivided attention of the Subcommittee on Roads and the Committee on Public Works, as well as the Senate." He was concerned that "matters of great importance" in the safety bill "could become obscured if they are part of a highway construction bill that becomes as controversial as it did last year."

The bill would authorize $500 million a year (FYs 1974-1975) from the Highway Trust Fund for highway safety, significantly more than the $289 million a year in the President's budget. "This use of trust fund revenues reflects my conviction that highway safety is an integral part of the total highway program and that its support from user revenues is fully justified and desirable." He added:

> The highway trust fund has facilitated the construction of the world's most advanced highway system, and it should be utilized to make this the world's safest highway system.

Senator Bentsen explained that the bill differed somewhat from the safety measures in the Federal-Aid Highway Act of 1972. He had reduced the number of categorical programs while still addressing "the essential activities" in broader authorizations. He highlighted several significant changes:

- For the highway safety programs under 23 U.S.C. 402, the bill authorized $150 million a year (FYs 1974-1975) for NHTSA and $85 million a year for FHWA. For highway safety research and development under 23 U.S.C. 403, the bill authorized $50 million a year for NHTSA and $15 million for FHWA. (For Section 402, the Federal-Aid Highway Act of 1970 had authorized $75 million (FY 1972) and $100 million (FY 1973) for NHTSA and $30 million a year for FHWA. For Section 403, the 1970 Act had authorized $70 million (FY 1973) and $115 million (FY 1974) for NHTSA and $10 million a year for FHWA).
- The bill authorized $10 million a year for the Secretary of Transportation to award in grants "to States which the Secretary determines have achieved above-average results in highway safety."
- It authorized $100 million a year for elimination of hazards at railroad-highway grade crossings. "The time," he said, "is long overdue to begin eliminating the thousands of grade crossings in our country." The Federal share would be two-thirds for projects on a Federal-aid system, one-third off the systems.
- Senator Bentsen continued the bridge reconstruction and replacement program, established by the Federal-Aid Highway Act of 1970, at $100 million a year. He expanded the program to include deficient bridges off the Federal-aid systems. The Federal share of projects on the Federal-aid system would be two-thirds, but one-third for off-system projects.
- The bill broadened the State-administered highway safety program to include Indian Tribes. "Highway safety is as serious a problem on Indian reservations as it is elsewhere, but existing statutes do not permit the same type of safety programs to be carried out on Indian reservations as are conducted by the States.
- Future highway safety standards would require States to prohibit motor vehicle operators from driving while under the influence of intoxicating liquors, narcotics, or drugs, and to provide effective enforcement and appropriate penalties that would constitute a meaningful deterrent.
- The Secretary's discretionary authority to suspend use of 10 percent of Federal-aid highway funds for States not implementing a highway safety program would become mandatory.
- The Secretary would be authorized to carry out safety research, including research into the effects of drugs on motor vehicle operators.

Senator Bentsen said the Highway Safety Act of 1973 was "a realistic bill, both as to program content and as to financing levels." [*Congressional Record, Senate*, February 19, 1973, p. S 2660-2663]

The Subcommittee on Transportation held hearings on the Highway Safety Act of 1973 on March 13 and 14. James E. Wilson, NHTSA's Acting Administrator, was the first witness. Wilson, who was NHTSA's Associate Administrator for Traffic Safety Programs, "heartily" supported the decision to authorize S. 893 entirely from the Highway Trust Fund. "We, too, believe that the cost of insuring the safe operation of highway transportation is properly considered an integral part of the cost of highway transportation."

Wilson summarized the thrust of S. 893 as being "to continue the existing programs under section 402 and 403 of the act and to provide significantly increased authorizations for those programs." Although the Department's proposal in 1972 had called for an authorization of $150 million for

Section 402 in FY 1974, he now recommended holding off on the increase at least 1 year in view of "the current limitations" of the Section 402 program:

The States had made progress, but "we lack any substantial certainty as to how to design effective countermeasures except for a few aspects of the highway safety problem." Target groups that contribute disproportionately to highway deaths and injuries had been identified, namely the young, elderly, drunken and "habitually or flagrantly negligent," but "we have not yet developed and validated ways of cost-effectively reducing the roles of these groups." He continued:

> It is one thing to provide the States with technical expertise, planning guidance, and seed money for the implementation of highway safety programs. It is quite another to provide substantial funds in the expectation of money alone making a significant impact upon the highway safety problem. The latter approach assumes the existence of a funding delivery system and a level of expert knowledge adequate to identify and concentrate efforts upon highly cost-effective countermeasures. It also assumes that the States have the will to take the tough measures necessary to reduce deaths and injuries.

Identifying cost-effective safety measures would "maximize the catalytic potential of the funds by promoting innovation and the establishment of institutionalized and specially-adapted capabilities for dealing effectively with the target groups." Providing too much funding before then would "perpetuate dependence upon Federal funding" and subsidize "improvident use of limited resources."

Wilson also questioned the need to change current requirements on penalties available to the Secretary:

> [The] Secretary's flexibility in securing State compliance should not be restricted. In most cases, direct negotiation and the suggestion of the possible necessity for invoking the penalty have been sufficient to persuade the States to take appropriate corrective measures.

He said the Department would submit legislative proposals for highway safety that would facilitate efforts by NHTSA's multidisciplinary crash investigation teams to encourage parties to provide information for research; prohibit the use of statements made to research teams and crash reports as evidence in court; and urge the States to adopt voluntarily laws requiring the use of safety belts. [*Highway Safety Act of 1973*, Hearings before the Subcommittee on Transportation, Committee on Public Works, United States Senate, 93rd Congress, 1st Session, Serial No. 93-H5, March 13 and 14, 1973, p. 26-31]

(In September 1969, Secretary Volpe selected Douglas W. Toms, director of the Washington State Department of Motor Vehicles, to serve as director of the National Highway Safety Bureau in FHWA. His arrival would be delayed because of illness in his family, but when the safety bureau left FHWA to become NHTSA in March 1970, Toms was its first Administrator. He stayed through President Nixon's first term, but did not depart until April 1, 1973. He told reporters that his resignation had been accepted in January, but that finding a replacement had proven difficult. "It's too hot a seat," he explained. Referring to Ralph Nader and auto safety groups, he said they "watch you like a hawk. There's no way that you can satisfy all the needs and demands of that diverse group and I can never recall a situation where everyone liked our final finding." ["Departing Traffic Safety Chief Says It's Hard to Find Successor in 'Hot Seat'," *The New York Times*, April 2, 1973]

(His successor, Dr. James B. Gregory, had worked for 21 years for Union Oil Company as a research chemist. He took the oath of office as Administrator on August 13, 1973. James E. Wilson was appointed Deputy Administrator. He took office in August 1973, but left NHTSA by the end of the year.

(Gregory, an advocate for requiring airbags in automobiles, announced his resignation unexpectedly in February 1976. Despite initial rumors that he had resigned because of plans to delay requiring installation of airbags in new automobiles, he insisted he had resigned for "strictly personal" reasons. "You get up one morning and you're worn out. You think maybe its time to lay this career to rest." He said he would remain in office until the President appointed a successor. On June 9, Secretary Coleman announced that he would postpone his decision on airbags until January 1977; in December 1976, after former Governor Jimmy Carter of Georgia defeated President Ford's election bid, Coleman deferred the decision to the new Administration while calling on the industry to install airbags voluntarily. [Henry, Diane, "U.S. Traffic Safety Chief Quits as a Decision on Air Bags Nears," *The New York Times*, February 27, 1976; Henry, Diane, "U.S. Delays Decision on Use of Auto Bags Till January," *The New York Times*, June 10, 1976; Holsendolph, Ernest, "Coleman Puts Off Air-Bag Ruling; Proposes a Limited Voluntary Plan," *The New York Times*, December 7, 1976])

Wilson was followed by Acting Administrator Bartelsmeyer who testified that while he agreed with the elimination of several safety programs that had been included in the 1972 legislation (Special Pavement Marking Program and the program to eliminate roadside obstacles), he did have some concerns. He favored broadening Federal programs through consolidation and letting States establish programs based on their own highway safety priorities. Funding separate programs for rail-highway crossing safety and bridge replacement "go fully in the opposite direction." He also objected to funding ($25 million) for purchase of pavement marking equipment. "We do not believe that the outcome of such a categorical approach would result in a major increase in safety."

He also said that expanding the bridge program to include bridges off the Federal-aid highway systems "would be a mistake." He explained that "the reason for establishing Federal-aid systems was to insure that funds are concentrated where the most traffic is carried and where the largest payoffs exist." With the Federal share increased to 70 percent, the proposed change "would make available a significant portion of the State funds for State roads not on any Federal-aid system." Off-system bridges can best be accommodated by State safety programs.

Highway safety programs, Bartelsmeyer said, were still in their formative stages. Much experience had been gained, but "during its first 6 years the program has operated at relatively low funding levels." He recommended against the funding increases in S. 893 until officials gained "a better understanding of the needs and priorities" for the safety program:

> In summary, we think it is important to continue the highway safety programs in their present form for at least 2 more years, during which we will be conducting an intensive evaluation of the present program.
>
> If, after this intensive evaluation, we determine that statutory changes are necessary, we will request legislative authority with respect to the highway safety program. [*Highway Safety Act of 1973*, p. 36-39]

John H. Reed, former Governor of Maine and now chairman of the National Transportation Safety Board (NTSB) agreed about avoiding categorical programs such as pavement marking, bridge safety, and grade crossing elimination. The NTSB supported improvement in these areas, but favored "the administration's approach of allowing the States maximum flexibility in selecting their own priorities." Further, separate funding for the grade crossing program was premature while FHWA and the Federal Railroad Administration (FRA) were conducting an inventory of all grade crossings.

Governor Reed also was concerned about establishing Federal standards in the areas of driving under the influence and law enforcement as a deterrent. "It is very difficult to obtain uniform deterrent effects in local courts by any form of Federal action." Allowing the States "the greatest possible flexibility in determining the emphasis they desire to place on different standards is preferable to singling out one or another standard, at the national level, for special emphasis." [*Highway Safety Act of 1973*, p. 46-47]

D. Grant Mickle said that HUFSAM favored the use of Highway Trust Fund revenue for only two-thirds of the Federal safety program, not 70 percent "since the benefits of the safety program are enjoyed by travelers on and off the Federal-aid systems." Instead of categorical programs for bridges and rail-highway grade crossings, HUFSAM favored "a more general safety emphasis program" that encouraged States to reconstruct and replace bridges, protect grade crossings, remove roadside obstacles, and undertake other safety work. Such projects off the Federal-aid systems should be financed out of the general Treasury. [*Highway Safety Act of 1973*, p. 63-65]

Max Sproles, executive director for highway-rail programs, Association of American Railroads, was concerned about funding levels for the rail-highway crossing elimination program. Sproles said that the country had 223,000 rail-highway crossings, only 22 percent of which have "train-activated protective devices." About half the crossings that needed improvement were off-system. He recommended, therefore, eliminating the two-third/one-third split to give the States "the opportunity to improve the most hazardous crossings based on their needs." [*Highway Safety Act of 1973*, p. 60]

The next witnesses were Dr. William Haddon, Jr., president of the Insurance Institute for Highway Safety, and the institute's vice president for communications, Ben Kelley. Dr. Haddon had been instrumental in securing passage of the National Traffic and Motor Vehicle Safety Act of 1966 and the Highway Safety Act of 1966. He also had served as the first Director of the National Traffic Safety Agency and the National Highway Safety Agency, both originally within BPR and FHWA before becoming the separate NHTSA. Ben Kelley was the former BPR official who wrote the critical *The Pavers and the Paved: The Real Cost of America's Highway Program*. Dr. Haddon had appointed Kelley vice president for communications in March 1969.

Rather than a lengthy statement, they presented a film called *Boobytrap!* In doing so, they emphasized that they were not talking about dangers on old highways with antique designs. They were talking about "built-in, manmade boobytraps" on modern highways—"the mess of boobytraps that has turned the sides of our roads into instruments of death and injury for thousands of car occupants each year," as Kelley explained in the film. He was referring to bridge piers, signposts and unyielding light poles, trees and rocks, steep embankments, ditches and drop-offs, and other fixed roadside objects. They represented, Dr. Haddon told the subcommittee, "a modern investment, modern insensitivity on the part of those responsible to the things that are killing and maiming people throughout this country and abroad . . . ."

The focus on roadside boobytraps had been highlighted in 1967 by Joseph Linko, a television repairman from the Bronx. In those days, repairs were commonly made in the homes. As Linko drove to his customers' homes from his shop on Third Avenue, he noticed obvious dangers that could easily have been avoided if highway engineers and maintenance crews had wanted to—guardrail ends that could spear vehicles, concrete sign stanchions and utility poles left exposed within a couple feet of roadways, rigid light poles—all placed along the newest highways in the area. Even when guardrails were placed along the roadsides, hazards were sometimes installed on the roadway side or before the guardrail instead of behind it. He took pictures of the boobytraps as part of a one-man safety crusade. After a while, he came to believe that (1) highway and traffic engineers did not know what they were doing and (2) if they did know, no one was paying attention to them.

On May 23, 1967, he had testified, along with his color slides, about highway boobytraps before Representative Blatnik's Special Subcommittee on the Federal-Aid Highway Program, Committee on Public Works. Linko's slides, straight-forward comments, and stories of disaster told the story in everyday terms, not those of the usual polished highway lobbyists.

Before the hearing he had examined the 65-mile Capital Beltway, which he found to be a study in deficiencies, as described in a July 1973 congressional report:

> The Subcommittee heard testimony and saw photographic evidence of such roadside hazards as unguarded steel I-beam sign supports anchored in concrete, exposed bridge piers, spear-like guardrail, guardrail lacking proper transition to bridge parapets; and gore areas with numerous post, pipe and concrete encumbrances. [The gore area is the triangle area at exits between the roadway and the exit ramp.] Some guardrail was placed along the highway shoulder in such a way that it actually would steer an errant vehicle into a fixed object, rather than divert it away. [*Highway Safety, Design and Operations (The Need for a Safer Driving Environment)*, Report of the Subcommittee on Investigations and Review to the Committee on Public Works, House of Representatives, 93rd Congress, 1st Session, Committee Print 93-7, July 1973, p. 1-3]

(Frank Turner, then the Director of Public Roads within the FHWA, had commented to the subcommittee in 1967 about how roadside hazards were included in modern highways:

> There is no simple answer to offer for the question you have asked as to why these roadside obstacles have been erected . . . . The principal cause is clearly that our previous judgment in designs dated 7 to 8 years ago did not anticipate the degree and frequency with which drivers would run off these new roads. It took some time to observe that a dismaying pattern of run-off-the-road accidents was occurring and an equally long time to develop the appropriate corrective measures and to get these into the stream of planning and construction. While some observed defects are still being included in recent construction, I believe that the focus of attention on these items by this Subcommittee and the Bureau has served to force the necessary and desired change. But change comes slowly, even with the impetus of such things as these hearings.

(On May 19, 1967, FHWA adopted *Highway Design and Operational Practices Related to Highway Safety* (known as "The Yellow Book" because of the color of its cover) prepared by AASHO's Traffic Safety Committee. In doing so, FHWA informed its engineers that, "It is expected the plans for projects on all high-speed highways yet to be advanced to contract will incorporate the features of added safety as are presented in the February 1967 report (the Yellow Book)." For completed Federal-aid highways, "each State highway department is asked to establish an active corrective program to apply the findings of the February 1967 report." [*Highway Safety, Design and Operations*, p. 10])

Six years later, the institute's film demonstrated that easily avoidable roadside boobytraps remained a common safety hazard. In addition to the film, they brought a scale replica of a Baltimore Beltway exit to Towson, Maryland, that had been featured in the film because it contained more than 100 boobytraps. Kelley said that FHWA estimated "that close to $1 billion would be required to remove the man-placed, man-designed, manmade hazards along the Interstate System." Beyond that, no one could estimate the cost because "no authority, whether State or Federal, has yet been required to carry out an inventory of the manmade and naturally grown obstacles along miles of primary and secondary and interstate highway roads."

Asked about FHWA progress in addressing the problem, Dr. Haddon replied, "Until recently, very little." Kelley added that recently, the Department of Transportation had required the State highway agencies to inventory obstacles in gore areas "with the idea of either removing them or putting up crash cushioning structures in front of them . . . but it has not yet gotten to the broader problem of what is happening on the miles between the gore areas, and what is happening on the many miles of noninterstate freeway."

The solution, Dr. Haddon said, was that "you have to go after this specifically with a specific mandate with the necessary funds and inventory, or they are just going to stay out there." [*Highway Safety Act of 1973*, p. 132-134]

(In 1972, Linko had returned to the Washington area and toured the Capital Beltway again. "A lot of the hazards were gone," reporter Hank Burchard said of the tour, "but a lot were still there, and he found that some new death traps had been added." For example, at the beltway interchange with State Route 450 (Defense Highway) in Maryland, a "guard rail still stood, like a battering ram, at the point where motorists must make split-second decisions at high speed." Linko and Burchard found pieces of a bronze-colored Corvette lying around the base of a steel lightpole that was only dented. Burchard said of Linko:

> What Linko does, basically, is nag, nag, nag . . . . He's been bugging people about highway safety for the best part of 10 years now. Linko says his specialty is stupidity, "the stupidity of engineers and construction crews who just don't think about what they're doing. They put up a guard rail. Then, 15 feet away, they put up a heavy steel signpost, so you have to knock down the signpost and kill yourself before you get to the guard rail that's supposed to protect you . . . ."
>
> Driving around the highways with Linko, you get an idea why he has been so successful in getting things changed. He talks loud, his tone is abrasive, and he talks long. It is very hard not to listen to Joe Linko. [Burchard, Hank, "Bronx Repairman Warns of Built-In Road Death Traps," *The Washington Post*, February 26, 1972]

(Administrator Turner had not appreciated Linko's implications. After Burchard's article appeared, Turner sent a letter to *The Post* assuring readers that, for FHWA, "there is no higher priority than highway safety." He had read Burchard's article "with dismay" and ordered a "prompt investigation" of the TV repairman's allegations. "As it turns out, the facts of the matter are quite different than portrayed by your reporter." Had he "bothered to check," he would have learned that the "downed steel light pole" (the base referred to in the article) was part of a safety upgrade to install a breakaway pole. The other location was the same:

> Maryland has a series of safety projects currently under way along its 44 miles of the Beltway. These include clearing gore areas, installing breakaway sign and light pole bases, adding guard rail to bridges and turning ends into cut slopes, construction of median barriers, and adjustment of drainage structures that constitute a fixed object hazard.

(Virginia was continuing to upgrade safety along its portion of the Capital Beltway. "Such misleading inaccuracies as contained in your Feb. 26 article do not contribute to this most important endeavor. Accurate reporting would help." [Turner, F. C., "A Further Look at Beltway 'Hazards,'" *The Washington Post*, March 30, 1972])

Haddon and Kelley were followed by Franklin M. Kreml, president of the Motor Vehicle Manufacturers Association (MVMA). He had been a leading figure in highway safety since his years as a police officer in Evanston, Illinois (1924-1935). He founded the Northwestern University Traffic Institute in 1936 (the institute was renamed the Northwestern University Center for Public Safety in 2000 with an expanded mission) and the Traffic Safety Division of the International Association of Chiefs of Police. During World War II, Kreml served as chief of the U.S. Army's Highway Division in the Mediterranean Theater and additional posts leading to the rank of Brigadier General. In addition to heading Northwestern University's Transportation Center and his stint with MVMA (1971-1975), General Kreml served as chairman of the Presidential Task Force on Highway Safety beginning in 1969 (the task force's October 1970 report was called *Mobility Without Mayhem*). In 1994, he was inducted into the Safety and Health Hall of Fame International.

He began by expressing disappointment that the Highway Safety Act and National Traffic and Motor Vehicle Safety Act, both adopted in 1966, had not resulted in the "real reductions in highway fatalities that we hoped would result." He explained:

> Instead, our annual highway death toll has continued to increase, despite the fact that millions of dollars have been added to the price paid by the car buyer because of the cost of such safety improvements. The fault, however, does not lie with the laws. It lies, instead, in the fact that their potential—the balanced approach to overall highway safety for which the legislation provided the foundation—has not been fully utilized.

Several things were needed to achieve the full potential of those laws:

"First, recognize that there are three critical elements of the highway safety problem: the vehicle, the driver, and the highway." The focus had been on vehicle safety and as a result, "we have not applied what we already know about driver and highway improvements and have not sufficiently extended our knowledge in these areas."

"Second, we need to undertake a great deal more research to understand and improve driver behavior and to improve highway design in terms compatible with driving and use patterns." Better guidelines for safe driving, adequate traffic control devices and signs "so both good and poor drivers are better able to avoid accidents," and research were essential.

"Third, we need to increase private sector participation in the national program." Following passage of the 1966 Acts, "many private agencies, organizations, and individuals, who had previously been active in the highway safety movement began to withdraw as the Federal Government assumed increased control." Kreml said, "The private sector—business, industry, the media, the public—must be involved in the highway safety movement."

"Fourth, and I would like to particularly emphasize this point . . . State and local officials must be active participants in the development and continuing review of Federal highway safety program standards." The Federal Government had a vital role to play, but State and local officials have "the legal power, the personnel, and the equipment to deal with it through programs for driver education and licensing, enforcement of laws governing vehicles in use, and the construction and maintenance of our roads and streets."

"Fifth, the funds appropriated for highway safety should be increased." The need for increased funding for State programs was "far in excess of the highest figure proposed" in any of the bills under consideration. In addition, he supported keeping categorical safety programs to a minimum "so that States can decide on the basis of local need how best to allocate the funds available to them."

As for current funding requirements, Kreml explained that current legislation gave the Secretary of Transportation the authority to withhold 10 percent of a State's Federal-aid highway funds if the State did not satisfy safety requirements. "This penalty has never been invoked and the realities of the Federal-State relationship suggest that it never will." As a more effective measure, he recommended incentive bonuses "to reward States for progress in implementing the program standards."

He concluded his presentation by saying of these steps:

> The American people, as they use the streets and highways of our country, are entitled to a much higher order of protection than they are getting today—protection which can be provided only through such a balanced effort.

Senator Bentsen began the question period by asking if the funding levels Kreml recommended were realistic in view of the Administration's position. "I can speak only as an advocate," Kreml replied, "not as an effective judge of political action," but he added, "I would suggest perhaps the committee has a responsibility to speak to the figures it believes are necessary."

Asked by Senator Bentsen about whether driver education programs were effective, Kreml said that "with some sadness, sir, I respond negatively . . . . I think that what is wrong with driver training is that it simply has not gone far enough." The programs he was familiar with "simply school the individual in the manipulation of the vehicle, not the control of the vehicle, particularly under emergency situations, or other difficult situations." He thought that training, licensing, supervision, and enforcement, together, could have a real impact on driver behavior:

> We hear some prophets of doom saying the human being is such a complicated, unpredictable, even whimsical mechanism, that it is foolish to try to control him. Yet, we have record after record of cities, counties, and States which through the application of effective control of traffic through law enforcement have reduced accidents and kept them down.
>
> I cannot be impressed, I cannot be anything, I am sorry to say, but impatient with those practitioners in our field who say that the driver is a hopeless proposition. It is the richest payoff area in my view in the middle and long run, assuming only we do effective work.

Senator Scott asked Kreml how long it might take to correct the many roadside boobytraps on the Nation's highways. Kreml replied:

> I think that this would, given the present programs, and the present rate of replacement, this would take on the order of 20 years. However, that should not be immediately interpreted as a statement of hopelessness, because it seems to me that if a sharper focus were to be taken on the accumulation of reliable data regarding the placement, the time, and the approximate cause of the accident, it would be possible to channel funds into those areas, and to those roads, and those particular places on the roads where we have a particularly hazardous situation. [*Highway Safety Act of 1973*, p. 134-141]

In considering the bill, the committee took only one roll call vote. On March 29, the committee rejected Senator Muskie's proposal to authorize $20 million in FY 1974 and $25 million in FY 1975 from the Highway Trust Fund in grants to States to establish and support inspection programs for motor vehicle emission control systems in areas requiring transportation controls to comply with air quality requirements. Only Senators Muskie and Richard C. "Dick" Clark (D-Ia.) supported the amendment, which was defeated 2-7. [*Highway Safety Act of 1973*, Report of the Committee on Public Works, United States Senate, to Accompany S. 893, 93rd Congress, 1st Session, Report No. 93-106, April 6, 1973, p. 17]

The committee voted unanimously to approve the bill, which included:

- Federal-aid safer roads system—The system included all public roads or segments thereof, whether on or off the Federal-aid systems, needing improvements to correct safety hazards, selected or designated by each State subject to approval by the Secretary of Transportation. A committee analysis explained that the hazards to be corrected fell within three major categories: "(1) projects to improve highway marking and signing; (2) to eliminate roadside obstacles; and (3) to eliminate hazards at railroad-highway grade crossings." The Federal share of project costs was 90 percent. This program was intended to correct roadside boobytraps.
- Bridge reconstruction and replacement—Authorized $100 million a year for FYs 1974 and 1975. The program was expanded to include deficient bridges off the Federal-aid systems.
- Bicycle safety—Added bicycle safety to the areas to be covered by highway safety standards and to required driver education programs. Since the Federal-Aid Highway Act of 1973, approved by the Senate on March 15, included new authority for construction of bicycle paths, the committee expanded the language in Title 23 encouraging development and promulgation of highway safety standards to include bicycle safety. The committee intended that the States implement driver education to reduce conflicts between motorists and bicyclists.
- Alcohol and other drugs—The committee dropped the provision requiring mandatory penalties for States not complying with the Federal alcohol safety standard, citing the complicated nature of the problem and the fact that most States were in compliance. The approved bill authorized the Secretary to continue research in this area.
- Indian reservations—Indian reservations would now be eligible for highway safety grants. The funds would be apportioned to the Secretary of the Interior, with 95 percent of the funds to be expended by Indian Tribes. The Federal share could be increased if necessary to assist a Tribe in meeting the non-Federal share. [*Highway Safety Act of 1973*, p. 13-15]

On April 6, Secretary Brinegar informed Senator Randolph of the Department's views on S. 893, the Highway Safety Act of 1973, as it approached a committee vote:

> The Committee has made some commendable modifications and additions to the existing Federal highway safety programs. While the thrust of these initiatives are laudable, we are concerned over the creation of a new "Federal-aid safer roads system", the provision for a Federal share of up to 90 percent for certain projects on this system, and the authorization of Federal funds for this new system and for the special bridge replacement program. We

> believe that the objectives of the Public Works Committee can be accomplished within existing funding for the Federal-aid highway systems and the levels in the Administration's proposed highway safety legislation (S. 1406).

To reduce expenditures, Secretary Brinegar recommended eliminating funds for the "Federal-aid safer roads system" and bridge replacement programs.

If the Federal-aid safer roads system survived, he suggested reducing the Federal share to 70 percent, the same as for other Federal-aid highway projects off the Interstate System.

The Department did not object to the use of Highway Trust Fund revenues for safety projects off the Federal-aid highway systems. Secretary Brinegar also supported the reduction in categorical safety programs to give States and communities greater flexibility in selecting safety projects.

He urged the committee to consider two provisions from the Administration's bill. Regarding the penalty on any State that did not implement a highway safety program, the Administration bill "would provide the missing incentive by enabling the State to recoup the withheld funds if timely correction action were taken by the State." He also advised the committee to include the provision that would "protect persons who voluntarily aid the efforts of Federal accident investigation teams" by barring the use of their statements as evidence. [*Highway Safety Act of 1973*, p. 19-20]

The Senate considered the legislation on April 12. Senator Bentsen explained why the committee had introduced a separate highway safety bill instead of combining it with the Federal-Aid Highway Act of 1973, as had been the case in 1972. The subject, he said, was important enough to demand consideration "apart from other matters which might detract from it." In highlighting its notable provisions, he began:

> Of primary importance is our belief that highway safety activities should be financed from the highway trust fund. This reflects the committee's conviction that safety is an integral part of the total highway program and that its support from user revenues is fully justified and desirable.

After several supportive statements and no amendments, the Senate approved the bill by voice vote.

Desperate in New York City

In 1973, officials in New York City and New York State were struggling with the cost of mass transportation systems, as they had for decades.

In the late 1940s, Governor Thomas E. Dewey had insisted that the subways operate on a self-sustaining, pay-as-you-go basis. As a result, the first fare increase, from 5 cents to 10 cents, went into effect in 1948 with the goal of ensuring the subways operated in the black. When the city turned the subways over to the new New York City Transit Authority in 1953, fares increased to 15 cents. The authority was supposed to cover all costs from the farebox, but it had failed to do so 13 out of 19 years despite fare increases in 1966 (to 20 cents) and 1970 (30 cents). Frank J. Prial of

The New York Times explained that the city "regularly shelled out thinly disguised subsidies that fool no one, but presumably honor the letter of the law."

On November 2, 1971, as mentioned earlier, voters statewide turned down Governor Rockefeller's $2.5 billion bond issue that would have raised $1.35 billion for mass transit and $1.15 billion for highways. Following the defeat, Governor Rockefeller said, "This is a reflection of the national mood . . . the people don't want to take on new taxes." The defeat was, he said, a vote for "belt-tightening."

Mayor Lindsay saw it differently. "The vote on the bond issue was a rebellion against concrete." With so much of the bond revenue earmarked for highways, city residents voted against the measure because they thought more should have been devoted to transit. Residents of other parts of the State, his reasoned, objected to bonds to keep the subway fare at 30 cents when they were paying more for bus fare.

Theodore Kheel, a key opponent of the bond plan, said, "The people saw through the flimsiness of the program," adding that the vote was a "repudiation of the highway trust fund." When the Governor challenged Kheel to come up with his own plan, as *The New York Times* explained, he suggested using city funds to hold the fare at 30 cents for a year:

> During that year, he said, there should be "a national campaign to open up the Federal Highway Trust Fund for transportation; legislation to force the Port of New York Authority to take a greater role in mass transit in the city, and new taxes on automobiles and their drivers aimed at easing the financial burden on mass transit. [Quote lacks a closing quotation mark in original.]

The defeat left State and city officials scrambling to find a way to keep the 30-cent fare. In the immediate aftermath of the vote, Governor Rockefeller planned to meet with Republican legislative leaders and was prepared to place "anything" city officials favored before the legislature. He added, "I personally don't see how it can be saved at 30 cents."

Mayor Lindsay, who thought that only the Republican-controlled State legislature could save the fare "if they really want to," asked his transit task force to find ways to finance the deficit without raising the fare. Possibilities included remnants of the plan developed on the assumption the city would receive $170 million from the bonds, to be supplemented with increased toll revenue from the Triborough Bridge and Tunnel Authority and loans from the city's sinking fund and the State. On November 8, 1971, Comptroller Beame presented an alternative plan to the task force. He suggested the city impose a "transit tax" on real estate transactions and businesses that benefit from public transportation to pay 40 percent of the transit fare. The task force, meeting at the Drake Hotel, was doubtful.

The Mayor, in the end, favored a plan proposed by Assemblyman Albert H. Blumenthal that would impose a statewide 10-percent income tax surcharge, with the revenue allocated to transit districts around the State. The tax would be deductible from Federal and possibly State income taxes. Whether the State legislature would approve the proposal was uncertain, but even if the plan were approved, the fare would "have to come to a minimum of 35 cents," Mayor Lindsay said on November 7.

Like Kheel, many officials looked to Washington for relief. In addition to his campaign to open the Highway Trust Fund, he called on the President's Federal Price Commission to prohibit the increases. Beame sent a telegram to President Nixon urging support to open the Highway Trust Fund to mass transit. Senator Javits announced support for that plan as well as his proposal to provide $200 million a year for transit subsidies. Representative Ryan and 18 other members of the city's congressional delegation introduced a bill to freeze mass transit and commuter fares at the present level until April 1973.

On December 6, 1971, a congressional delegation from New York City met with Secretary Volpe to discuss increased Federal-aid for the city's mass transit system. Representative Ryan said the delegation did not expect to receive additional funds, but wanted to demonstrate that, as the *Times* put it, "the Federal Government is not the transit cornucopia that many state and city officials have said it would be." Just 2 days earlier, for example, Governor Rockefeller had proposed a plan that would avoid a fare increase above 35 cents if the city received $100 million in Federal operating subsidies. As Representative Ryan knew, the Nixon Administration opposed such funding.

The city also was hoping to receive capital grant funds for construction projects such as the new Second Avenue Subway line that had exploded in cost (from $151 million in 1968 to $371 million in 1971). UMTA Administrator Villarreal pointed out that New York had submitted requests for $200 million more than the agency's $600 million budget in the current year. He added that no State could receive more than 12.5 percent a year of total funds. "New York ought to keep in mind that we have hundreds of requests from 50 states to consider. Over the years, the city's grants might add up $800-million, but I just don't see any possibility of the very large grants coming through in the near future."

What emerged was a hybrid plan that Mayor Lindsay and Governor Rockefeller approved, but that required a 5-cent fare increase to 35 cents. The city would borrow $100 million from the State, to be repaid over 5 years, and $100 million from its own sinking fund, and generate another $70 million from increased tolls on the Triborough Bridge and Tunnel Authority facilities. The plan also counted on smaller amounts of revenue from advertising on transit vehicles and franchises for hot dog stands.

A *New York Times* editorial on November 16 stated the problem:

> New York City's mass transit system hurtles toward financial disaster as fare-box revenues fall farther and farther behind operating costs. Union negotiators are pressing for pay increases far in excess of Federal guideposts. Even with a noninflationary settlement, prolonged neglect and accumulated deficits now require an estimated $440 million more in revenues over the next two years than the present thirty-cent fare will generate.

The editorial said that "Mr. Beame may well be right in believing that business and real estate interests would prefer a transit tax, deductible from Federal and perhaps state tax returns, to another fare increase." However, "we continue to believe that the emphasis should be placed on the automobile as the source of revenue to ease the transit crisis it has helped create." Saying that every fare increase had resulted in more automobile traffic, the *Times* favored the plan to increase Triborough Bridge and Tunnel Authority tolls and impose new tolls on the East River Bridges. Adopting the principle that "rubber should pay for rail," the editorial concluded:

> As New York City confronts the choice of higher transit fares or some form of new and additional taxation, there is good reason for city officials to select as their target the fume-spewing, air-fouling, street-clogging, noise-creating, grossly inefficient automobile. Indeed, this is an idea whose time came quite some time ago.

Mayor Lindsay estimated that the city needed to spend $5.3 billion for transit development in the 1970s, and $2.8 billion of that sum by 1975. The *Times*, describing the plan to visit Secretary Volpe, pointed out that New York City officials were hoping to unlock the Highway Trust Fund to help with these costs:

> Actually, New York officials have given themselves a fairly rigid timetable for unlocking the Federal coffers for mass transit. Both the Governor and the Mayor have described the plan to hold the fare at 35 cents as a stop-gap measure designed to provide "breathing space" in which to work out a permanent plan for financing mass transit here, presumably with some kind of Federal participation.

A Wall Street bond specialist, asked by the *Times* to describe the New York City Transit Authority's financing, said: "The Mad Hatter and Mr. Micawber, working together, could never dream up anything as strange."

Now, the *Times* said, the self-sustaining philosophy "has been discredited," in part by Atlanta's example. The fare reduction and sales tax subsidy in Atlanta were a stark contrast with talk in New York City that the fare would have to go up to 40 cents in 1973 and even higher in later years. "The only hope is some fundamental change in federal legislation that would tap the Highway Trust Fund or some other source for mass-transit operating subsidies." The *Times* added:

> Ridership on Transit Authority buses and subway has dwindled from a peak of 2.7 billion a year, just before the fare went from five cents to 10 cents, to a low of 1.65 billion in the year ended last June 30.

Transit officials expected a similar decrease after the 35-cent fare went into effect in 1972, but predicted that the "resistance factor" would lesson over time.

[All from *The New York Times*: Lynn, Frank, "State Transit Bond Issue is Voted Down Despite Rockefeller-Lindsay Campaign," November 3, 1971; Prial, Frank J., "Rockefeller and Lindsay Differ on Ways of Saving Transit Fare; Bond Loss Deepens Fiscal Crisis," November 4, 1971; Prial, Frank J., "City Hall Parley is Called on Fare," November 5, 1971; Lynn, Frank, "Everybody Was for the Bond Issue Except the People," November 7, 1971; Prial, Frank J., "City Delegation Due to See Volpe Today on Transit Aid," December 7, 1971; "Testing Transit Theories," November 16, 1971; Prial Frank J., "Financing of Transit Authority is Complex," December 28, 1971]

Fares increased to 35 cents on January 5, 1972, and ridership declined 2.5 percent the first month, although revenue was up 10 percent over the comparable period in 1971. The companion toll increase had resulted in a million fewer motorists using Triborough facilities, although they did not necessarily switch to the buses or subways. A spokesman for the Kinney Parking System said, "We were hit pretty hard by the toll increase. I don't know how the people are getting into the city, but they are not driving and parking in public garages." [Prial, Frank J. "Transit Riders Found to Have Dropped 2.5% After Rise," *The New York Times*, January 29, 1972]

Throughout 1972, State and local officials searched for a way to meet expenses without another fare increase. On June 10, 1972, the Governors' Special Commission on Financing of Mass Transportation issued a 90-page report. The commission, formed by the Governors of Connecticut, New Jersey, and New York, called for such changes as:

- A $25-a-person mass transportation tax on everyone who lives or works in the New York metropolitan area;
- A 100-percent Federal income tax credit on all local transportation taxes;
- That the States be allowed to spend Federal transportation aid on capital projects or debt service for capital projects;
- Creation of general transportation funds by the Federal and State governments to channel transportation taxes and revenues into transportation projects;
- An increase in the Federal share of capital projects to 90 percent;
- Establishment of a 25-cent toll on all free-water crossings into Manhattan; and
- Continuation of fares at a reasonable level even with large Federal subsidies to ensure that users of the service share in paying for it.

These changes, which relied heavily on modification of Federal laws, were "imperative," the report said, if mass transportation in the tri-State area were to be improved while being put on a sound financial footing. "It is essential for the Federal Government, now, to reverse the imbalance in transportation financing, to define new priorities, and to provide new sources of revenue for financing mass transportation services." If the proposed changes were adopted, "the region's mass-transportation problems can be solved while keeping fares within the reach of all the people." ["$25 Tristate Tax Urged on Transit," *The New York Times*, June 11, 1972]

The following week, Mayor Lindsay and the city's congressional delegation increased their efforts to secure Federal operating subsidies. Representative Emanuel Celler (D), chairman of the Judiciary Committee and the most senior member of the House, said he was "plumping" for help and was "gratified" that UMTA was about to approve $25 million for the Second Avenue Subway line and $65 million to buy 300 subway cars. The prospects for operating subsidies were dimmer. Although the Senate had approved $400 million in subsidies as proposed by Senator Javits in an amendment to the housing bill, its fate in the House was unknown while the Nixon Administration was opposed.

The city's Transportation Administrator, Constantine Sidamon-Eristoff said, "We're pressing everywhere we know how to bring the problem to the attention of the National Government." He said the city was urging conversion of the Highway Trust Fund to a Transportation Fund. The city, he said, had "exhausted" available city funds to keep the fare at 35 cents until March 31, 1973. While the State had not helped with operating subsidies, "the city has bailed out this system from which the state and whole metropolitan region benefit." ["City Looks Anew to U.S. for Aid in Rescuing Its Transit System," *The New York Times*, June 12, 1972]

In August 1971, Mayor Lindsay had switched his registration to the Democratic Party. At the time, tthe assumption was that he would run for President, but he was coy. "Whether this means I will run for President, I do not know," he said in a news conference. As the *Times* reported after the event, he was seen as a potential contender by Democratic Party officials around the country, but as for his prospects, their reactions "ranged from unabashed enthusiasm to outright hostility." [Tolchin, Martin, "Lindsay Switches to Democrats, Urges New National Leadship; as for Presidency: 'I Don't Know,'" *The New York Times*, August 12, 1971]

The speculation about a presidential bid proved correct. However, Mayor Lindsay's bid for the Democratic presidential nomination sputtered. As author Rick Perlstein explained, "He was still a media darling, a regular on Johnny Carson's *Tonight Show* [then originating in New York City]; dazzled by his charisma . . . [but] the media seemed not to be noticing that his New York was becoming the symbol for everything wearying and gross about the United States." [Perlstein, Rick, *Nixonland: The Rise of a President and the Fracturing of America*, Scribner, 2008, p. 611] Mayor Lindsay responded to those who despised New York City by saying he had confronted every one of the city's problem, even if he had not quite solved them.

As a Republican until August 1971, he had no constituency within the Democratic Party and lost his Republican funding sources. Despite adopting positions to the left of the eventual nominee, Senator McGovern, and portraying himself as a Washington outsider, Mayor Lindsay gathered only a little more than 196,000 votes during the primary season (a little over 1 percent of the total cast). He finished sixth in the Wisconsin primary on April 5, earning only 7 percent of the vote. Recognizing that the voters had spoken, he dropped out of the race. Presidential historian Theodore H. White summarized Mayor Lindsay's candidacy: "It may be said that rarely has so eloquent a spokesman for so profoundly important a cause presided over so blundering a political campaign." His impact on the Democratic National Convention in Miami, July 10-13, 1972, would be negligible and a harbinger of his long-term political decline. [Cannato, p. 515-521]

Theodore Kheel continued his campaign against the Port Authority of New York and New Jersey, which was restricted by a 1962 law from being involved in any mass transit projects other than the PATH commuter railroad linking Manhattan and New Jersey. Kheel had suggested a legislative change that Governor Rockefeller had approved on June 9, 1972, despite strong opposition from the financial community. However, Governor William T. Cahill of New Jersey, who previously supported the idea, indicated he would not sign a comparable bill because of concern about lawsuits from bondholders who had been assured that all revenue not needed for operation and maintenance would be devoted to retiring the bonds by 2007. "I am disappointed," Kheel said, "at the apparent reversal of Governor Cahill's supposed concern about getting the Port Authority involved in mass transportation." [Prial, Frank J., "Governor Presses for Mass Transit," *The New York Times*, June 10, 1972]

Kheel also had gone to court in an attempt to have the 1962 law declared illegal. In 1971, the U.S. District Court refused to hear the suit. The U.S. Court of Appeals upheld the lower court's ruling. On August 24, 1972, Kheel announced that he would take his case to the Supreme Court in a continuing effort to free as much as $2.5 billion of the Port Authority's borrowing power for mass transportation. He acknowledged that if the Supreme Court refused to hear his suit, he was "finished in the Federal courts." Whatever the outcome in the courts, Kheel had this to say about the New Jersey Governor: "After three years in office, Mr. Cahill's accomplishments with regard to the Port Authority add up to a big zero." [Prial, Frank J., "Governor Presses for Mass Transit," *The New York Times*, June 10, 1972; No byline, "Kheel's Mass Transit-Aid Suit taken to U.S. Supreme Court," *The New York Times*, August 25, 1972]

Governor Cahill, who had taken office on January 20, 1970, had been working to improve transit since taking office. In November 1972, he and Governor Rockefeller announced a "dramatic and significant breakthrough" to allow the Port Authority to participate in mass transportation capital improvements. The agreement covered rail links between midtown Manhattan and Newark and Kennedy International Airports, an extension of PATH, and direct rail service into Penn Station for commuters on the Erie-Lackawanna Railroad. The estimated cost was $650 million, but the plan was contingent on enactment of legislation nullifying the 1962 Port Authority covenant. The bill signed by Governor Rockefeller in June would not be sufficient.

Dr. Ronan, in a news conference, said the Federal contribution would cover up to two-thirds of the cost, but he hoped to see that increased to 80 percent so the Federal Government would pick up four-fifths of the bill. He insisted that the bi-State announcement would not be another in a series of "breakthroughs" that were ultimately unfulfilled. "These are not to be considered idle projections." Work on the Kennedy access line could start in 1973.

Kheel was skeptical. "The law clearly states that no Port Authority revenues can be used for mass transportation until the present bondholders are paid off—which won't happen until 2007." The projects were "off in the dim future." Having spent a year trying to have the 1962 law declared illegal, he said it was "crystal-clear," adding, "I don't see how they can get their hands on Port Authority money until it is declared unconstitutional in court." He acknowledged that such a finding could take years. Officials hoped to get around the restriction by limiting the agreement to bonds issued after 2007. [Prial, Frank J., "Governors Say Port Authority Plans $650-Million Mass-Transit Program," *The New York Times*, November 16, 1972]

In response to confusion about the proposal, Governor Rockefeller wrote to the *Times* on November 17 to clarify that the plan involved State and Federal money, but Port Authority funds as well:

> Federal funds are expected to provide some 60 per cent of the total cost. The Port Authority's fund will supply virtually all the remainder. State funds will be used only as contingencies, if necessary at times, to advance the projects. Accordingly, Port Authority revenues will be a principal source of funds for these projects.

> Port Authority bonds will not include the limitations of the so-called "statutory fund" as Governor Cahill and I are recommending legislation to eliminate this restriction on the Port Authority capacity to finance mass-transit improvements. [Rockefeller, Nelson A., "Tapping the Port Authority," *The New York Ti*mes, November 21, 1972]

Following action by the New Jersey State legislature, Governor Cahill approved the necessary legislation on December 28, 1972. The State's premise was that the 1962 law permitted the Port Authority to participate in passenger rail projects if they were self-supporting. (Kheel pointed out that the restriction had been put in the 1962 expressly because such projects are never self-supporting.)

On March 14, 1973, the same day the U.S. Senate approved the Muskie-Baker amendment opening the Highway Trust Fund to rail transit, the New York Senate approved two bills in support of the $650 million Port Authority mass transportation construction program. However, the State Assembly failed to approve the bills. Democrats had attempted to amend the bills, which they considered a "cave-in" to financing arrangements dictated by New Jersey to appease bondholders. They feared the measure would endanger the financing for mass transportation. [Farber, M. A., "2 Port Authority Mass-Transit Bills Pass in Senate but Stall in Assembly," *The New York Times*, March 15, 1973; and Kheel, Theodore W., "Jersey Catching Up," *The New York Times*, January 23, 1973]

Observers expected Assembly approval the following week, but the bill failed again on March 19.

That same day, *The New York Times* reported on a city-ordered study conducted by the Regional Plan Association, "a private, nonprofit group that aims to promote the coordinated development of the three-state metropolitan area." The study, released on Sunday, March 18, examined ways that transportation might be designed to help poor people. The ideas included:

- Extend 15 bus lines to connect low-income areas to manufacturing districts in New York City's five boroughs and industrial areas in New Jersey. The extensions would primarily help residents of the South Jamaica area of Queens, the Bushwick section of Brooklyn, and the East Tremont-South Bronx area.
- Free bus transfers at all bus intersections in the central parts of low-income areas, a total of 355 bus connections, with a goal of free transfers throughout the system.
- A 75-percent discount on train commuting from midnight to noon outbound from the city, and noon to midnight inbound.
- Revised subway construction plans to be more responsive to the needs of poorer residents.

In what *The Times* called "its most controversial section," the report also recommended that policies on automobiles "be tailored so that efforts to save the environment would not be made at the expense of low-income workers." The article continued:

> The report reasoned that workers' use of cars to get to jobs brought "substantial gains in travel time, to wider job choice and in income." It therefore proposed such measures as a subsidy for down-payments on small cars, a reduction in auto-insurance costs for low-

> income people, increased parking space in low-income areas and a re-evaluation of policies that have "led to a virtual moratorium on new expressway construction in the city."

The New York City Transportation Administration had initiated the study, with the U.S. Department of Housing and Urban Development providing $150,000 of the total cost of $197,000. The agency had received the report on August 1, 1972, but had delayed release while other agencies reviewed and debated its content. With the release, Administrator Sidamon-Eristoff provided preliminary comments on the report:

> Mr. Sidamon-Eristoff said some of the bus and train proposals might be adopted if the costs could be kept reasonable. But he suggested that most of the ideas for encouraging auto use, in this time of concern about pollution, were "not in the real world." He specifically opposed car subsidies, increased residential parking and expressway construction.

The city's Environmental Protection Administration had disassociated itself from the report months earlier, but a spokesman for the agency said, "There are things we simply cannot accept, mainly the exhortations for more expressways and encouraging use of cars by poor people." [Witkin, Richard, "More Bus Service is Urged to Help Poor Get to Jobs," *The New York Times*, March 19, 1973]

Traffic continued below expectations on Triborough facilities, down 8 percent in 1972 compared with 1971 since the toll increase went into effect on January 5, 1972. Revenue, however, was up. On April 2, 1973, the Triborough Bridge and Tunnel Authority turned over $74 million in surplus funds to the New York City Transit Authority, up from the expected $24-$50 million. The additional funds would help the authority address its expected deficit of $200 million. [Prial, Frank J., "74-Million Goes to Transit From Car-Commuter Tolls," *The New York Times*, April 2, 1973]

Governors Rockefeller and Cahill were in Manhattan on April 4 to dedicate the twin towers of the World Trade Center. Governor Rockefeller called the twin towers a "great marriage of utility and beauty." With State offices as the principal tenants of the South Tower, he said, "The old days of trudging from building to building are over." Governor Cahill called the World Trade Center "an industrial and trade United Nations."

U.S. Secretary of Labor Peter J. Brennan was to read a statement by the President, but refused to cross a picket line established by striking PATH workers who used the occasion for their cause because their employer, the Port Authority of New York and New Jersey, also owned the World Trade Center. James Kellogg III, chairman of the Port Authority, read the President's statement, which hailed the center as "a major factor for the expansion of the nation's international trade."

Theodore Kheel, "the persistent critic of the Port Authority," as the *Times* called him, had suggested the day before that the two Governors "propose at the dedication ceremonies that the World Trade Center be sold to private enterprise at the earliest possible date." The *Times* continued:

> He called the center "socialism at its worst" because it competed unfairly with private developers and urged that the money from its sale be used for mass-transit purposes.

When a reporter asked about Kheel's suggestion, Governor Rockefeller replied, "It gets him a headline." [Prial, Frank J., "Governors Dedicate Trade Center Here; World Role Is Cited," *The New York Times*, April 5, 1973]

On April 29, Mayor Lindsay announced a plan to reduce transit fares, which the MTA had predicted would hit 55 cents in 1974 unless new funding sources could be found. (He had announced on March 7, 1973, that he would not seek a third term as Mayor, but was undecided whether to run for Governor or the Senate in 1974.) The Mayor's plan would roll back bus and subways fares to 25 cents and cut rail commuter fares by 30 percent while providing for long-range financing of mass transit in the area. The plan, which called for creation of a regional governmental body to raise and disburse funds, relied on Federal grants and State matching funds. The Federal funds were projected to come from the Federal-Aid Highway Act of 1973, which had passed the Senate with the Emergency Commuter Relief Act. If the Federal funds did not materialize, the plan called for a payroll tax of one half of 1 percent. "The tax would be repealed when equivalent Federal subsidies were made available."

The Mayor pointed out that, "The current agreement to maintain the New York City transit fare at 35 cents expires on the first of January and a new labor contract must be negotiated with the transit workers by March 1, 1974." These dates created pressure for answers to the financing problems. A 55-cent fare would be "a killing blow to our economy and an outrage to every working family in the New York area." It would, he said, "drive more passengers out of the system, would increase traffic and air pollution, confront low- and moderate-income families with impossible daily travel costs and threaten the viability of the city's economic center."

He planned to submit legislation to the State legislature the following week. Asked to comment, Governor Rockefeller said, "this is the first we have heard of this. We can't comment until we have studied it." [Prial, Frank J., "Lindsay Suggests Plan for Transit to Reduce Fares," *The New York Times*, April 30, 1973]

Mayor Lindsay had said that to avoid "the darkest day in the economic history" of the area, officials "must put aside our petty parochialisms and face the menace which faces us all." Nevertheless, *The Journal of Commerce* pointed out the basic flaw in the proposal:

> Any such scheme devised on the assumption that Congress will enact the mass transit bill in a form that Mr. Nixon won't veto, that the requisite funds will be approved for this purpose by Washington and that Albany will cheerfully match them would strike us as resting on something decidedly less than "a firm and durable financing footing" . . . . Mr. Lindsay's scheme offers no real promise that new people will be drawn into the transit system; what it does guarantee is that people using [transit] now won't have to pay so much to use it. ["Cause Without Effect?" *The Journal of Commerce*, May 1, 1973]

The Christian Science Monitor also was skeptical about the proposal from Mayor Lindsay, whose term as Mayor would end in December:

> His timing is significant in that he is widely thought to have an eye on the 1974 Gubernatorial election when Gov. Nelson A. Rockefeller is expected to try for a fifth term. Mayor Lindsay's fare-reduction plan . . . is expected to win him many friends among the millions of New York City voters who ride the city's subways and buses.

However, the plan was facing "the inevitable uphill battle" in the State legislature while "city politicians are falling all over themselves to support the general idea of holding the line on fares." City Comptroller Beame, running for Mayor, "is somewhat miffed that Mayor Lindsay sneaked in before him with a transit-fare plan." He wanted to stabilize and possibly reduce the 35-cent fare. (Based on the Atlanta experience, Kheel wanted to reduce the fare to 15 cents as a way of increasing ridership.) [Winder, David, "Lindsay's Transit Plan Woos Voters," *The Christian Science Monitor*, May 9, 1973]

The legislature would not complete action on the two Port Authority bills until May 7. Governor Rockefeller, with Governor Cahill at his side, signed the legislation on May 10, putting into effect the breakthrough agreement that had been announced the previous November. One of the bills authorized the Port Authority to begin work on the rail link between Manhattan and Kennedy International Airport without waiting for preliminary design work on the companion rail link to Newark Airport. The second bill allowed for the PATH link from Pennsylvania Station in Manhattan to Plainfield, New Jersey, via Newark. The legislation also covered improvement of terminals and other facilities. At a joint news conference in the Park Lane Hotel, Governor Cahill called the legislation "really historic" because it demonstrated that "this entire metropolitan area really is a unit." [Fowler, Glenn, "Rockefeller Signs Mass-Transit Bills, Completing Bi-State Pact on Facilities," *The New York Times*, May 11, 1973]

On May 17, Dr. Ronan announced that a fare of 60 cents was virtually inevitable unless $300 million in subsidies could be found from city, State, and Federal sources. He said that in submitting a city budget proposal, Mayor Lindsay had omitted the annual $100 million subsidy for transit operating costs that the city had paid the previous 2 years:

> This $100-million amounted to about 8.3 cents for each subway and bus ride. Without it, fares would have been 45 cents since January, 1972. Meanwhile, inflation keeps pushing costs higher and ridership continues to decline. Even if the city continues to provide $100-million a year in transit aid, an additional $200-million annually will be needed to keep the fare at 35 cents.

Even with fares staying at 35 cents, ridership had declined and the city had lost a "disastrous" 252,000 jobs in the 3 years ending in December 1972.

As for the Lindsay plan, Dr. Ronan pointed out that "it really does not make that much difference where the money comes from," as he said the Atlanta plan illustrated. He was leading the fight in Congress, he said, to secure Federal-aid for operating subsidies. [Prial, Frank J., "Ronan Says Fare May Rise to 60C," *The New York Times*, May 18, 1973]

An editorial in *The New York Times* commented on Dr. Ronan's warning. The current "bailing-wire fiscal arrangements" had been "adopted in desperation two years ago." A fare increase to 60 cents "would impose extraordinary burdens on low-income workers, especially those living in two-fare zones, and risk crippling the city economy." Mayor Lindsay's plan, announced "belatedly" several weeks earlier, of a regional cooperative plan offered an option:

> A regional payroll tax is one alternative. Adjusting bridge and tunnel tolls to discourage the use of private automobiles—to make these vehicles begin to pay their way—would encourage better utilization of mass transit facilities and generate further revenues.

Further, cities across the Nation were facing similar problems:

> Efforts must be redoubled in the Congress to break open the Highway Trust Fund and to divert some of this available money to mass transit needs.

For now, though, the "time for deliberate discussion has almost run out, but not quite." The city, region, and State still had time "to develop a permanent transit subsidy scheme that will avoid recurring fare-rise crises and assure adequate levels of service." ["Fare Disaster," The New York Times, May 21, 1973]

Mayor Lindsay appointed a committee to press for his financing plan. At a City Hall news conference, the Mayor said his proposal had drawn little reaction from State legislators and Mayoral candidates. "The silence has been great," he said, but failure by the legislature to address the area's transit problems would be "an act of irresponsibility."

He also announced that Theodore Kheel would head the committee. Kheel endorsed the Mayor's plan, although he reserved judgment on a payroll tax as the most effective option for transit funding. In the absence of a plan, Kheel said, he agreed with the Mayor that the fare would go to 55 cents on January 1, 1974. Kheel added that he had also served on the committee to save the 20-cent fare. "I think I was on committees to save the 5-, 10-, and 15-cent fares, too." ["Mayor Picks Kheel to Head the Panel on Train-Fair Cuts," *The New York Times*, May 16, 1973]

The Watergate Controversy Gathers Steam

President Nixon turned 60 on January 9, 1973. He told wire service reporters that the key to staying young was "Never slow down." As President, he had many problems "but boredom is the least of them." [Associated Press, "Nixon, at 60, Gives Formula for Living: 'Never Slow Down,'" *The New York Times*, January 9, 1973] His birthday, a Tuesday, was a normal work day, with a small dinner party with family and friends to celebrate the occasion.

Even as he launched his counsellor plan to control domestic affairs, his National Security Advisor, Henry Kissinger, was in Paris trying to negotiate a peace pact with Le Duc Tho of the Hanoi Politboro. The jobless rate was at 5.2 percent, Congress was debating the war, and the President was considering budget cuts. On January 11, he ended mandatory wage-price controls he had imposed to control inflation.

On January 10, Judge John J. Sirica opened the trial on the Watergate burglars. According to prosecutors, the Committee to Reelect the President had paid the defendants to gather "intelligence" on opponents, including the break-in and bugging at the Watergate office of the Democratic National Committee. One of the burglars, E. Howard Hunt, quickly pleaded guilty to the six charges against him. Although he told the court he did not know whether "higher-ups" were involved, the government planned to call him before a grand jury for questioning. On January 15, four more of the burglars admitted their guilt, leaving only James W. McCord, Jr., and G. Gordon Liddy on trial.

A few days earlier, a *Times* profile had described the President as quiet, contemplative, and isolated, but bitter about what he considered unfair attacks on his decision to bomb population centers in North Vietnam over the Christmas season. On the eve of the Inauguration, the *Times* said of Vice President Agnew:

> In six short years, the Greek immigrant's son who once sold vegetables on a Baltimore street corner has become one of the most talked about politicians in the country, and on the eve of the President's second four years in office, it is Mr. Agnew who is talked about most as the man most likely to succeed Mr. Nixon as the Republican nominee.

Not everyone agreed with that assessment. Although he was "the object of unmitigated envy," observers also expressed "considerable doubt, substantial scorn, and no little compassion as well." They doubted his political skills and thought he was on top – but only for now. [Herbers, John, "Nixon at 60: Quiet and Contemplative," *The New York Times*, January 10, 1973; Wooten, James T., "Agnew is 'On Top' Now, But Faces a Hazy Future," *The New York Times*, January 20, 1973]

President Nixon was inaugurated for his second term on January 20, 1973. The Nation, he said in his Inaugural Address, was "on the threshold of a new era of peace." At home, "Government must learn to take less from people so that people can do more for themselves." He said:

> We have the chance today to do more than ever before in our history to make life better in America—to ensure better education, better health, better housing, better transportation, a cleaner environment—to restore respect for law, to make our communities more livable—and to ensure the God-given right of every American to full and equal opportunity.
>
> Because the range of our needs is so great, because the reach of our opportunities is so great, let us be bold in our determination to meet those needs in new ways.
>
> Just as building a structure of peace abroad has required turning away from old policies that have failed, so building a new era of progress at home requires turning away from old policies that have failed.
>
> Abroad, the shift from old policies to new has not been a retreat from our responsibilities, but a better way to peace.
>
> And at home, the shift from old policies to new will not be a retreat from our responsibilities, but a better way to progress.

Two days later, on January 22, President Johnson died of heart failure at his ranch in Johnson City, Texas, while the Supreme Court voted 7 to 2 to overrule all State laws that prohibit or restrict a woman's right to obtain an abortion during her first three months of pregnancy.

On January 26, in Judge Sirica's courtroom on January 26, Hugh W. Sloan, former treasurer of President Nixon's reelection committee, testified that campaign funds totaling $199,000 had been paid to Liddy with the approval of two top campaign officials, former Commerce Secretary Stans and former Attorney General Mitchell (January 21, 1969 – March 1, 1972).

A Vietnam pact was signed the next day and Defense Secretary Melvin R. Laird ended the military draft.

The White House fired Dwight L. Chapin, the President's former appointments secretary, on January 28. Newspaper disclosures identified him as the White House contact with Donald H. Segretti, who had led Republican "dirty tricks" efforts to disrupt Democratic primaries and harass candidates.

The jury in the Watergate trial convicted Liddy and McCord on January 30. The two were sent to jail pending a bail hearing. At the hearing on February 2, Judge Sirica expressed his view that a recently concluded criminal investigation had failed to get to the bottom of the Watergate crimes. He hoped that the pending congressional investigation would explore the crimes more deeply.

In the following days, additional revelations were published. A Haldeman aide, Gordon C. Stachan, was linked to Liddy and Segretti. Chapin acknowledged to the Federal Bureau of Investigation (FBI) that he had directed the President's personal attorney, Herbert W. Kalmbach, to pay Segretti. The U.S. prosecutor in the Watergate trial, Earl J. Silbert, announced he would open a grand jury to hear from the defendants. The government had been unable to develop evidence against anyone else, but would focus on Liddy during the hearings.

On March 12, the President invoked executive privilege in announcing that current and former members of his personal staff, including Chapin and counsel John W. Dean III, would not testify before congressional panels investigating Watergate. The Senate Judiciary Committee immediately challenged the announcement by calling Dean as a witness in the confirmation hearing of L. Patrick Gray III to become Director of the FBI. Questions had arisen about Gray's tenure as acting Director because he had provided FBI reports on the Watergate break-in to Dean.

On March 14, the same day the Senate approved the Muskie-Baker amendment, Dean stated he would not testify, but would respond to written questions. In the face of declining support in the Senate, Gray asked that his nomination be withdrawn, an action President Nixon announced on April 5.

On March 23, Judge Sirica imposed a sentence of not less than 6 years, 8 months and not more than 20 years in prison on Liddy and a sentence of 35 to 40 years on his codefendants. James McCord wrote to Judge Sirica claiming that he and his co-defendants had been under "political pressure to plead guilty and remain silent" to avoid testimony that might result in naming others involved in the incident. McCord asked to meet with the Judge in private because he feared retaliation if he revealed who was behind the break-in.

Within days, McCord had talked with investigators on Senator Ervin's Select Committee about previously unnamed White House conspirators, including Dean and Jeb Stuart Magruder, the reelection committee's deputy manager who was now Assistant Secretary of Commerce. While Hunt began appearing before a grand jury, McCord agreed to testify before the committee in secret, adding to the list of those involved: former Attorney General Mitchell; Charles Colson, former deputy counsel to the President; Haldeman; and Robert Mardian, former Assistant Attorney General.

Press secretary Ron Ziegler announced on March 30 that the White House was willing to compromise with Senate investigators on an informal basis in any way that does not violate the separation of powers. Aides were instructed to appear before the grand jury if summoned. The change in approach appeared to be a response to bipartisan congressional criticism that the White House appeared to be covering up high level involvement in the Watergate break-in. During an April 2 news conference, Senator Ervin rejected the offer of informal cooperation, saying that White House staff were not "nobility and royalty" who could avoid testifying.

On April 4, Senators Ervin and Baker of the investigating committee said that they had no evidence implicating President Nixon's aide, Haldeman, in Watergate.

An attorney for Colson announced on April 7 that he had passed a privately administered lie detector test confirming that he had no knowledge that his employee Hunt was going to break into the Watergate offices of the Democratic National Committee. [Lydon, Christopher, "Colson Reported Passing a Lie Test on Watergate," *The New York Times*, April 8, 1973]

In Augusta, Maine, on April 7, the chairman of the Republican National Committee, George H. W. Bush, addressed 250 Maine Republican leaders. He told reporters the wiretapping of Democratic National Headquarters at the Watergate was "grubby business" and "Mickey Mouse." Calling the decision behind the plan "amateurish," he said, "I don't think for a minute the President condoned it." He said that he and the President wanted to clear up the controversy as soon as possible and the best way to do that was through complete disclosure by all participants. ["A 'Grubby Business,'" *The New York Times*, April 8, 1973]

On April 17, President Nixon appeared before a hastily arranged news conference to make two announcements on the Watergate investigations. First, he believed the White House had reached agreement with the Ervin Committee on testimony by present and former aides. He said that the committee's ground rules allowed witnesses to testify in executive (secret) session if appropriate. This type of testimoney was mutually acceptable, but he reserved the right to invoke executive privilege during the course of questioning.

Second, he said that he had begun his own "intensive new inquiries into this whole matter" on March 21. In recent days, he said, he had reviewed the facts uncovered by his investigation as well as the progress of the Justice Department's investigation:

> I can report today that there have been major developments in the case concerning which it would be improper to be more specific now, except to say that real progress has been made in finding the truth.

He said that if any employees were indicted, he would suspend them and, if they were convicted, he would automatically discharge them. He also had expressed his view to the appropriate authorities that no one in his Administration, past or present, should be immune from prosecution. He added in closing that, "I condemn any attempts to cover up in this case, no matter who is involved."

The President took no questions. However, Ziegler informed the press that previous statements denying White House involvement were "inoperative." The President's announcement was perceived as a counteroffensive to reclaim the initiative and demonstrate that he was not involved in wrongdoing.

Senator Ervin had been driving home to Davidson, North Carolina, at the time of the President's announcement. The following day he said that he appreciated the President's offer of cooperation but reserved the right to determine whether a current or former White House aide could refuse to testify.

Attorney General Richard G. Kleindienst withdrew from involvement in Watergate-related matters on April 18. Congressional and White House sources were claiming that serious allegations had been made against Mitchell, Dean, Stans, Kalmbach, Magruder, and Strachan. Reports on April 19 indicated that former Attorney General Mitchell had sat in on meetings where plans for bugging the opposition were discussed, but rejected the plan. Dean, embattled amidst the growing allegations, issued a statement indicating that he would not be made a "scapegoat."

The swirl of Watergate events continued as Mitchell appeared before the Federal grand jury on April 20, reportedly stating he "would like to know" who kept pressing for spying after he turned it down. Reports indicated that prosecutors were seeking links between Haldeman and the break-in. Soon, rumors were spreading that Haldeman's role in the White House had been diminished as a staff shake-up appeared imminent.

On April 26, Gray was reported to have told friends he destroyed documents given to him by Ehrlichman and Dean after Dean said they "should never see the light of day." The same day, Magruder resigned from his post at the Commerce Department. He reportedly had told prosecutors that Dean and Mitchell had approved the break-in.

Each day brought new, often shocking developments. On April 27, Gray quit the FBI and the President named EPA Administrator Ruckelshaus as Acting Director. Haldeman and Ehrlichman were reportedly fighting efforts to force them out of the White House, John Dean was seeking immunity in return for his testimony, and a new development linked Watergate to the ongoing trial in Los Angeles of Daniel Ellsberg for leaking the Pentagon Papers he had helped prepare for the Rand Corporation. Judge William M. Byrne, Jr., told the courtroom that he had received a letter from Watergate prosecutor Silbert indicating that Liddy and Hunt had burglarized the office of

Ellsberg's psychiatrist, Dr. Lewis Fielding, in search of Ellsberg's medical files that they hoped could be used to discredit or at least embarrass him.

As April ended, President Nixon was reported to be in "virtual seclusion" at Camp David trying to decide how to put Watergate behind him, but continuing revelations would make that impossible. Haldeman and Ehrlichman, who normally accompanied the President to Camp David, had stayed in Washington amid a swirl of reports about developments within the White House. Dean was reportedly ready to testify under oath about their role in the coverup of the break-in. Haldeman and Ehrlichman were preparing to meet with Silbert to discuss actions.

On April 30, President Nixon returned to Washington to deliver a televised address in which he accepted responsibility for Watergate, but stated that he did not have prior knowledge of it. The wrongdoing was by his staff and reelection committee who had authorized the break-in in an effort to stop wrongdoing by the Democrats.

Dean, Ehrlichman, and Haldeman had resigned earlier in the day. Attorney General Kleindienst also resigned, saying that with friends and associates involved in the investigation, his impartiality was in doubt. The President chose Defense Secretary Elliot L. Richardson to become Attorney General. In addition, the President indicated that he was turning his internal investigation of the allegations over to Richardson. This shift would allow the President, he thought, to focus on important foreign and domestic matters.

Pressure was growing for appointment of a special prosecutor as evidence mounted that top aides had engaged in obstruction of justice and the circle of those involved continued to expand. The FBI released a report on May 1 in which Ehrlichman indicated that the break-in at Dr. Fielding's office had come about after he, at the President's direction, had ordered a secret investigation into the leak of the document. Hunt and Liddy were assigned the task, but Ehrlichman claimed he did not know they planned to break into Dr. Fielding's office.

Investigators had concluded by May 3 that the Committee to Reelect the President had employed Segretti to engage in a campaign of spying and dirty tricks to ensure a weak opponent for the President. Republicans worked to undermine other candidates during the primary season to ensure that Senator McGovern would win the nomination. For example, Segretti had conspired to undermine Senator Muskie, the presumed frontrunner, and stir dissent among the candidates and their campaign staffs. In one incident, Segretti sent a letter on the letterhead of Senator Muskie's campaign advising "Fellow Democrats" that they should be aware of "several facts." Perlstein summarized the false allegations:

> These included that Henry Jackson had sired an illegitimate daughter in high school and had twice been arrested for homosexual activity in Washington, D.C., and that Hubert Humphrey had been arrested for drunk driving in the company of a "known call girl" generously provided him by a lumber lobbyist.

Another tactic was a letter supposedly from the Muskie campaign to wealthy Democrats asking them not to contribute to his campaign; he preferred small donors, not "the usual fat cats." [Perlstein, p. 633]

On May 4, Judge Byrne released Hunt's testimony revealing that the White House had conceived the break-in at Dr. Fielding's office and that it had been accomplished with equipment from the Central Intelligence Agency. The effort, Hunt claimed, was directed by two White House aides, David Young and Egil Krogh, Jr., now the Under Secretary of Transportation. The effort had begun in August 1971 when Young, Krogh, Hunt, and Liddy met in the Old Executive Office Building to develop a strategy for investigating leaks. With Ehrlichman's approval, they agreed on the break-in at Dr. Fielding's office because they expected to find information they could use to undermine Ellsberg. The burglary took place on September 3, 1971, but they did not find the files they were seeking. Ehrlichman vetoed their plan to break into Ellsberg's home.

Information soon emerged that the President had attempted to prevent release of information about the break-in at Dr. Fielding's office. As recently as a week before the courtroom revelation, Ehrlichman had told Krogh that for national security reasons, the President did not want the information released. The President reversed himself at Richardson's insistence. Krogh had since acknowledged his involvement and resigned from the Department of Transportation.

On May 10, Mitchell and Stans were indicted for perjury, while the White House continued a restructuring necessitated by recent developments. One change was that the plan to control the domestic departments via counsellors was abolished, a move that was inevitable following the departure of Haldeman and especially Ehrlichman. This explicit change reflected a more subtle shift as the President's grand scheme of executive control of power in Washington was unraveling.

President Nixon informed the counsellors of the changes during a May 10 Cabinet meeting. Following the principle of de-centralization, he would restore authority to the Cabinet Secretaries for the operation of their departments as well as policy development, congressional liaison, and public relations. He wanted a lower profile for the White House, but assured the Secretaries that the door to the Oval Office would be open to them. The three counsellors were stunned, having had no warning of the change. [Lee, p. 188, 191]

Reporting the changes, *Engineering News-Record* commented:

> Transportation Secretary Claude Brinegar—crippled by the loss of under secretary Egil Krogh, who admitted a supervisory role as a former White House aide in the burglary of a safe in the Watergate-related Pentagon papers case—moves out of the shadow of James Lynn, still Housing and Urban Development (HUD) Secretary but no longer urban development counselor [sic]. Similarly, Interior Secretary Rogers Morton can now bypass former natural resources counselor Earl Butz and Labor Secretary Peter Brennan can be independent of human resources counselor Caspar Weinberger. Policy disputes will go more directly to Nixon. ["Watergate Fallout Slows Government Machinery," *Engineering News-Record*, May 17, 1973, p. 7]

Citing "improper government conduct," Judge Byrne dismissed the charges against Ellsberg and his codefendant, Anthony J. Russo, Jr. "The conduct of the Government had placed the case in such a posture that it precluded the fair, dispassionate resolution of these issues by a jury."

The Senate Select Committee on Presidential Campaign Activities began public hearings on May 17 with Senator Ervin in charge.

[This section is based on numerous articles appearing in *The New York Times* from January through May 18, 1973.]

Secretary Brinegar Makes His Case

Following Senate approval of S. 502 on March 15, the bill was referred to the House Committee on Public Works.

As noted earlier, Vice President Agnew was in Los Angeles on March 21 to address the international rapid transit seminar. In his discussion of the Administration's support for Highway Trust Fund diversion to mass transit construction, he mentioned the Senate's vote for such use:

> Only the concurrence of the House is necessary now to provide our states and localities with the flexibility they will need to achieve a truly balanced transportation system. ["Transit Commuters Wooed by Agnew," *Washington Star*, March 22, 1973]

The House Subcommittee on Transportation, with Representative Kluczynski as chairman, had begun hearings on the 1973 highway legislation on March 1, 6, and 7 with consideration of the Highway Safety Act of 1973, H.R. 2332, introduced by Representative Harsha on January 18. It included such measures as:

- Rail-Highway Crossings—Required the States to identify crossings in need of grade separation, relocation, or protective devices and authorized $150 million (FY 1974) and $225 million (FY 1975) for installation of safety devices on roads whether on or off the Federal-aid system.
