Structure 05417 is located on Route 109 over an unnamed brook in Morris. The hydraulic evaluation indicates that the structure can convey the estimated 100-yr frequency design event flows, however during the check storm event the structure does not have one foot of freeboard before reaching overtopping condition. Because the structure does not have adaptive capacity, is located within a 100 year FEMA flood zone, and is nearby several scour critical structures, it is considered to be climate critical.
