

## EconWorks (C03/C11)

*Easier-to-use tools for improved economic analysis*

### Challenge

Communicating the economic analysis outcomes to the public and decision makers is an important role of transportation planners. EconWorks was developed as a set of tools designed to help planners assess and logically explain the details of transportation projects. After being successfully implemented by several SHRP2 Implementation Assistance Program recipients, EconWorks is available on its own site to give users access to the latest project tools and case studies. Visit and bookmark <https://planningtools.transportation.org/13/econworks.html> for the latest developments in EconWorks.

### Solution

**The Bundle: Transportation Project Impact Case Studies (C03); and Tools for Assessing Wider Economic Benefits of Transportation (C11)**

Transportation Project Impact Case Studies (T-PICS) is a web tool that planners can use to quickly see the range of economic development impacts that occur as a result of different types of projects in different settings. T-PICS includes 100 detailed case studies of already-built highway capacity projects and their economic development impacts. Each case study includes pre- and post-project economic and land development data and local interviews that together portray the actual, observed economic development impacts of those projects, as measured at least five years after project completion. T-PICS results can help refine public debate about highway projects by establishing boundaries of the likely positive and negative impacts that typically occur from such projects. Understanding what changes in productivity result from improvements in market accessibility, intermodal connectivity, scheduling, logistics, and international competitiveness helps communities and transportation agencies identify transportation options to meet their goals.

SHRP2 has also developed a suite of new spreadsheet-based analysis tools that will provide the range of reasonable economic impact expectations for a proposed highway project. The new tools also enable a wider economic analysis by integrating four components: travel time reliability, connectivity to intermodal facilities for freight and passengers, access to labor and product markets, and an accounting tool that integrates the other three components and creates benchmarks to the local area. By considering net effects, SHRP2 tools provide decision makers with better information for answering the question of whether a region will be economically better off because of a transportation investment, and if so, by how much. The outcome of this process describes the project's ultimate economic impact in terms of direct effect, total local effect, and total national effect.

## The Implementation Assistance Program

Implementation assistance is available to help State departments of transportation (DOTs), metropolitan planning organizations (MPOs), and other interested organizations deploy SHRP2 Solutions. A range of opportunities is available to raise awareness of SHRP2 Solutions and to encourage early adoption of these products. Application periods are offered approximately twice per year. Each product selected for implementation assistance has the potential to deliver more efficient, cost-effective programs to meet the

challenges facing transportation today.

**CAPACITY**

One of four SHRP2 focus areas, Capacity products help transportation organizations to systematically integrate environmental, economic, and community requirements into the analysis, planning, and design of new highway capacity.

### What is the EconWorks bundle?

*The SHRP2 C03-Transportation Project Impact Case Studies and C11-Tools for Assessing Wider Economic Benefits of Transportation, are two products culminated in a new bundle of economic analysis tools including web-based sketch planning tools, statistical models, case studies, and a practitioners' handbook. This product bundle helps planners make broader-based, more realistic assessments of the wider economic impacts of highway capacity projects, which in turn leads to better decisions, more prudent investments, and – ultimately – a more robust economy at the local, regional, and national levels. These products were bundled together because of their technical and subject-matter commonalities as a result of an executive review committee consisting of AASHTO and FHWA leaders.*

## Benefits

Highway capacity improvements can support economic vitality by providing better access to markets and the labor force, saving time and money otherwise spent as a result of traffic delays, improving safety, reducing pollution, and supporting a higher quality of life. The question is: Which improvements actually make a difference and how do we make accurate projections about that? Better understanding how changes in productivity, such as improvements in market accessibility, intermodal connectivity, scheduling, logistics, and international competitiveness, help identify transportation options that meet community goals.

### About SHRP2 Implementation

The second Strategic Highway Research Program (SHRP2) is a partnership of the Federal Highway Administration (FHWA), the American Association of State Highway and Transportation Officials (AASHTO), and the Transportation Research Board (TRB). TRB completed the research, and now FHWA and AASHTO are jointly implementing the resulting SHRP2 Solutions that will help the transportation community enhance productivity, boost efficiency, increase safety, and improve the reliability of the Nation's highway system.
