

Overview of Precast Concrete Pavement in the United States

The Federal Highway Administration (FHWA) has developed extensive resources for the use of precast concrete pavement (PCP) technology. PCP has gained wide acceptance in the United States (see Figure 1) for rapid and long-lasting repair and rehabilitation of concrete pavements; for the reconstruction of access/exit ramps; for replacement of heavily-trafficked asphalt ramps, intersections, and bus pads; and for numerous other applications in which short work-windows and long-life pavement performance are desired.

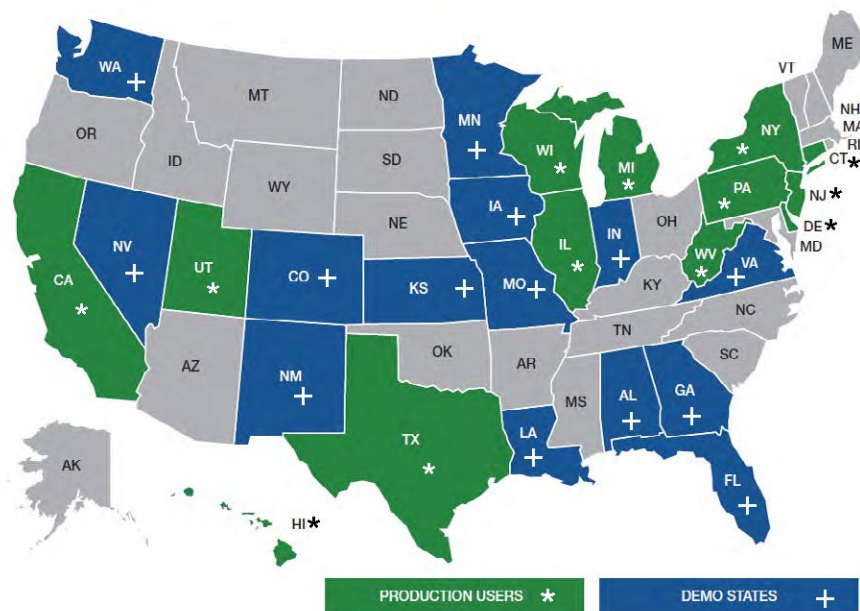

Figure 1. Precast Concrete Pavement Use in the United States as of June 2019

Source: Shiraz Tayabji, Advanced Concrete Pavement Consultancy LLC

In April 2019, FHWA completed a five-year project titled Implementation of Precast Concrete Pavement Technology. Highway agencies, contractors and precast concrete suppliers have worked together in 28 states in the United States to successfully construct one or more (up to ten or more) projects utilizing precast concrete panels. Project sizes have ranged from 200 panels for the replacement of intersections and ramps to 7,000 panels for the reconstruction of continuous sections of pavement. Eleven of these agencies received funding as a result of the implementation of the second Strategic Highway Research Program (SHRP2), which offset a portion of the cost of PCP construction.

PCP panels can be reinforced top and bottom in both the longitudinal and transverse directions; pretensioned in the longitudinal direction and reinforced top and bottom in the transverse direction; or, pretensioned in both the longitudinal and transverse directions. Satisfactory base support has been achieved using either grade placement or placement on leveling lifts. Doweled load transfer has been provided using either bottom slots (a patented detail) or a variety of top-slot details.

Applications of PCP typically are scheduled for short lane-closures during periods of minimum traffic. An overnight closure from 9:00 p.m. to 5:00 a.m. the following morning allows for effective use of PCP and full opening of the pavement to traffic. Similarly, a weekend closure from 9:00 p.m. Saturday to 5:00 a.m. Monday allows for greatly improved productivity followed by full opening to traffic.

Maintenance of traffic (MOT) and long-life pavement performance are the principal needs that lead to the use of precast concrete for pavement applications. Precast concrete in full-depth repairs is expected to last for 20 or more years, depending on the condition of the adjoining pavement. Precast concrete intersections, ramps and other continuous applications are expected to provide 40 or more years of maintenance-free service, except for periodic grinding to restore desired surface characteristics. Asphalt and rapid-hardening concrete can provide short-term service, but will need to be replaced several times during the expected life of precast concrete panels.

Every highway agency has numerous sites, including intersections, ramps, underpasses, bus pads, full-depth repairs, and continuous sections of pavement, where precast concrete can be used both to improve MOT and to provide long-life pavement performance. FHWA has developed a Guide Specification Tech Brief that highway agencies can use as they develop plans and specifications for specific projects. In addition, FHWA has developed checklists for fabrication and installation of precast concrete panels and other technical resources. Information documents from FHWA and other sources are available online for free download.

Precast Concrete Pavement Resources

Guide Specification for Jointed Precast Concrete Pavement, FHWA-HIF-19-017, January 2019

<https://www.fhwa.dot.gov/pavement/concrete/pubs/hif19017.pdf>

This guide specification presents considerations for the use of jointed precast concrete pavement (JPrCP) based on the best practices observed from the experiences of numerous highway agencies. This guide specification does not create any Federal requirements other than those stipulated in statute or regulation.

Jointed Precast Concrete Pavement Panel Fabrication and Installation Checklists, FHWA-HIF-19-016, January 2019 <https://www.fhwa.dot.gov/pavement/pubs/hif19016.pdf>

This guide set of checklists for the construction of PCP is intended for highway agency construction personnel; however, the checklists should be of use for the contractor personnel as well. The checklists presented here follow the flow of typical PCP project construction activities. The checklists are not intended to replace the agency's quality assurance and the contractor's quality control activities, but rather to supplement and reinforce these activities to ensure a quality product is constructed. Agency and contractor personnel using the checklists should be knowledgeable in PCP construction and PCP technology. Depending on the type of PCP being used for a specific project and the project plans and specifications, not all the items in the checklists may be applicable. The user will need to determine which items are pertinent to their specific project.

Precast Concrete Pavement Bedding Support Systems, FHWA-HIF-16-009, November 2015

<https://www.fhwa.dot.gov/pavement/concrete/pubs/hif16009.pdf>

The proper seating of precast concrete panels on the base is a critical design and construction element. The support under the panels needs to be strong and uniform. The requirements for bedding support systems for precast panels should be no less than similar requirements for cast-in-place concrete pavement.

Load Transfer Systems for Jointed Precast Concrete Pavement, FHWA-HIF-16-008, October 2015

<https://www.fhwa.dot.gov/pavement/concrete/pubs/hif16008.pdf>

The incorporation of a well-designed load transfer system at active transverse joints is critical to long-term performance of jointed PCP systems. The process involves the use of a dowel-bar slot on either one or both sides of the joint. Slots may be located at either the bottom or top surface of the panel. Bottom slots are open along their full length, whereas top slots typically incorporate a narrow width and may be either fully open at the surface or open only along a partial length of the slot.

Precast Concrete Pavement Technology Resources, FHWA-HIF-19-012, April 2019

<https://www.fhwa.dot.gov/pavement/concrete/pubs/hif19012.pdf>

Among the resources cited in this Tech Brief is the *Manual for Jointed Precast Concrete Pavement*, 3rd Edition, published by NPCA. The manual can be found at <https://precast.org/jprcp-manual/>. Printed copies of the NPCA manual were distributed to FHWA's Division Offices, Federal Lands Offices, Resource Center, and to each State highway agency. Similarly, a list of online addresses for downloading electronic copies of all FHWA publications that resulted from this project to implement PCP technology was sent to each of those recipients.

Precast Concrete Pavement Technology Implementation, Final Report, FHWA-HIF-19-013, April 2019

<https://www.fhwa.dot.gov/pavement/concrete/pubs/hif19013.pdf>

This final report provides an overview of PCP technology and explains FHWA's goal of providing technical support for PCP implementation not only for highway agencies receiving grants through SHRP2 but also for all highway agencies wishing to utilize PCP technology. PCP demonstration projects were constructed in 28 states, and highway agencies in 13 of those states are "production users" of PCP, meaning that they have adopted PCP as an alternate pavement for certain types of projects. California DOT has constructed more than 20 PCP projects, and other production users have constructed 5 to 10 PCP projects. The final report provides convenient links to Case-Study Reports for SHRP2 projects, links to technical briefs, and links to a guide specification, check-lists for fabrication and construction activities, and other resources.

Precast Concrete Pavement Implementation by U.S. Highway Agencies, FHWA-HIF-19-011, January 2019 <https://www.fhwa.dot.gov/pavement/concrete/pubs/hif19011.pdf>

The use of both jointed and posttensioned PCP systems has advanced during the last decade due to a combination of work sponsored by FHWA, projects constructed by highway agencies, and innovations by the construction industry. PCP has been adopted for routine use by several highway agencies, as detailed in the Tech Brief.

Case Study Reports for Precast Concrete Pavement

- **Alabama Department of Transportation** – Replacement of rutted two-lane asphalt exit ramp from I-165 in Mobile. <https://www.fhwa.dot.gov/pavement/concrete/pubs/hif18003.pdf>
- **Connecticut Department of Transportation** – Replacement of rutted asphalt bus pads on the rapid transit busway in New Britain. <https://www.fhwa.dot.gov/pavement/concrete/pubs/hif17015.pdf>
- **Florida Department of Transportation** – Replacement of concrete bridge approach on the east side of westbound I-10 near Quincy. <https://www.fhwa.dot.gov/pavement/concrete/pubs/hif18057.pdf>
- **Hawaii Department of Transportation** – Rehabilitation of concrete pavement along a section of H-1 near Honolulu. <https://www.fhwa.dot.gov/pavement/concrete/pubs/hif17001.pdf>
- **Kansas Department of Transportation** – Replacement of two distressed concrete intersections and a bridge approach on US 73 in Leavenworth. <https://www.fhwa.dot.gov/pavement/concrete/pubs/hif17005.pdf>
- **Louisiana Department of Transportation and Development** – Reconstruction of distressed concrete access ramp onto eastbound I-20 at LA 169 near Greenwood. <https://www.fhwa.dot.gov/pavement/concrete/pubs/hif18053.pdf>
- **Texas Department of Transportation** – Replacement of rutted asphalt at the intersection of Texas state highways SH 97 and SH 72, approximately 100 miles south of San Antonio. <https://www.fhwa.dot.gov/pavement/concrete/pubs/hif17017.pdf>
- **Washington State I-90 Pavement Rehabilitation Using Precast Concrete** – Replacement of deteriorated sections of eastbound I-90 near Issaquah. <https://www.fhwa.dot.gov/pavement/concrete/pubs/hif19026.pdf>
- **Wisconsin Department of Transportation** – Full-depth repair of distressed transverse joints on the Beltline Highway (US 12) around Madison. <https://www.fhwa.dot.gov/pavement/concrete/pubs/hif17003.pdf>

ADDITIONAL INFORMATION

For more information please contact Sam Tyson, Concrete Pavement Engineer, FHWA's Office of Preconstruction, Construction, and Pavements, Phone: 202-366-1326; E-mail: sam.tyson@dot.gov.

DISTRIBUTION AND AVAILABILITY

This Tech Brief can be found at <https://www.fhwa.dot.gov/pavement/concrete>.

KEY WORDS

Asphalt pavement rehabilitation, concrete, concrete pavement, concrete pavement construction, concrete pavement design, concrete pavement performance, concrete pavement rehabilitation, precast concrete pavement

NOTICE

This Tech Brief is disseminated under the sponsorship of the U.S. Department of Transportation in the interest of information exchange. The U.S. Government assumes no liability for the use of the information contained in this document. The U.S. Government does not endorse products or manufacturers. Trademarks or manufacturers' names appear in this report only because they are considered essential to the objective of the document.

QUALITY ASSURANCE STATEMENT

The Federal Highway Administration (FHWA) provides high-quality information to serve Government, industry, and the public in a manner that promotes public understanding. Standards and policies are used to ensure and maximize the quality, objectivity, utility, and integrity of its information. FHWA periodically reviews quality issues and adjusts its programs and processes to ensure continuous quality improvement.
